The Engineering and Building Record

THE SANITARY ENGINEER.

ESTABLISHED 1877.

Conducted by HENRY C. MEYER.

DEVOTED TO

ENGINEERING AND ARCHITECTURE.

OF SPECIAL INTEREST TO

Engineers, Architects, Builders, Contractors, Mechanics, and Municipal Officers.

THE TREATMENT OF MUNICIPAL PROBLEMS A PROMINENT FEATURE.

"It has been of incalculable value to the general public, whose interest it has

"It has been of incalculable value to the general public, whose interest it has always served."—Cincinnati Commercial.
"It may be regarded as the representative paper devoted to Architecture and Engineering."—Boston Herald.

"It stands as a fine example of clean and able journalism."—Railroad Gazette.
"A paper whose excellence and independence merit continued prosperity."—Railroad and Engineering Journal.
"Congratulate it upon the enviable position it has attained."—American Machinist

Machinist.

Under date of January 9, 1888, General M. C. Meigs, formerly Quartermaster-General, U. S. Army, and recently Architect of the new Pension Building at Washington, wrote as follows:

1239 VERMONT AVENUE, WASHINGTON, D. C., January 9, 1888.

THE ENGINE RING AND BUILDING RECORD:

DEAR SIRS: I enclose check for \$5.00, for which please send me "Steam Heating Problems" and "Plumbing and House-Drainage Problems." I will be obliged, also, for a copy of your No. 6, Volume XVII., January 7, 1888, which is a capital number, just read and sent to a Western engineer, a friend, containing much in his line of work.

I have looked at the Index of Volume XVI. It is a marvelous list of knowledge made accessible to the profession at small cost to each subscriber.

I congratulate you upon producing for the Building trade one of the most copious and valuable instructors in safe and sanitary building science in all branches ever published.

Faithfully yours,

Published Saturdays at 82-84 Fulton Street, New York. \$4 per year. 10c. per copy

N. B.—An attractive feature is its series of critically selected Architectural Illustrations, artistically rendered and handsomely reproduced.

OMMITTEES intrusted with the erection of Public Buildings and Engineering Works should advertise for proposals in The Engineering and Building Record. They will thus reach Contractors in every State and Territory, likewise in Canada. The advantage of competition thus secured is obvious.

THE ENGINEERING & BUILDING RECORD

THE SANITARY ENGINEER.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1887, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 17. Number 1.

EDITORIALS:

PUBLISHED EVERY SATURDAY.

NEW YORK, DECEMBER 3, 1887.

LONDON, DECEMBER 17, 1887.

SINGLE COPIES, TEN CENTS. IN AMERICA Subscription, \$4.00 per year in advance, post paid. SINGLE COPIES, SIXPENCE. Subscription, 20s. per annum in advance, post paid.

THE ENGINEERING & BUILDING RECORD. conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. (P. O. Box 3037). Its opinions upon all technical subjects are either prepared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE. Postage Paid.

> OFFICE IN GREAT BRITAIN. 92 & 93 FLEET ST., LONDON.

TERMS, 201. PER YEAR, IN ADVANCE. Postage Paid. SINGLE COPIES. SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of The Engineering & Building Record (New York), and crossed ——— & Co.

Continental subscriptions are also received by F. A Brockhaus, Esq., Querstrasse 29, Leipzic, Germany, and Ashbr & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, apan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5. The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by cneck or money order payable to The Engineering & Building Record.

When a change of address is desired, both the old and new addresses should be given.

WITH this issue this journal begins its seventeenth volume.

GOVERNMENT BUILDING METHODS.

AT the recent annual convention of the American Institute of Architects, Mr. M. E. Bell, the late Supervising Architect of the United States Government, read a paper on "The Paramount Requirements of a National Building for Custom-House, Judicial, and Postal Purposes." His four years' experience in the Government service should secure for his suggestions careful consideration, and we reprint his paper on another page of this issue. He clearly points out one cause for the needless expense and unsatisfactory results in the erection of our Government buildings in saying that when the erection of a building is authorized only a small portion of the sum needed is appropriated. Contracts cannot, therefore, be entered into beyond amounts appropriated, hence it is plain to see how an architect is hampered, the work delayed, and the ultimate cost largely increased. Mr. Bell is doubtless correct when he says:

"The lower House of Congress being Democratic and the Senate Republican, each is trying to make a record for economy in appropriations; and while it is possible to pass bills for necessary buildings, the appropriation committees decline to appropriate the money and must assume the responsibility for everything resulting from a policy of inadequate and dribbling appropriations."

And further very truly adds:

"The public are much more interested in this matter than the architects themselves;" and "Ignorance of the subject is our enemy to fight."

The public-spirited members of the architectural profession have been doing good service in recent years in their agitation looking to an improvement in our Government architecture and building methods. Yet we apprehend that much popular education on this point will still be necessary to stimulate Congress to deal with the question as it deserves. Such education should, therefore, be the constant work of our architectural associations, and then, when the country is fortunate enough to have in Congress one influential member who appreciates the importance of the reform that is needed and is willing to devote his time and energies to secure the necessary legislation, then, and not till then, can our architects secure that for which they are so commendably striving. Earnest effort, therefore, should be made to find such a man and enlist him in the cause, since without such an advocate the recommendations of occasional committees will be of little avail.

DO THE INHABITANTS OF NEWARK AND OF JERSEY CITY SOMETIMES DRINK SEWAGE?

THE answer to the above question must now be, clearly and definitely, yes. "But," says an ancient citizen of Newark, "suppose we do, what of it? The water looks good and tastes good. I've been drinking the water ever since it was introduced and I'm all right." No doubt many of the people of Newark would say the same thing. Many of them are protected against the disease which affords the most striking evidence of the impurity of a water-supply-viz., typhoid fever—because they have been affected with this disease years ago, and, as a rule—just as is the case with regard to scarlet fever—a man has the disease but once.

According to a paper by Dr. A. R. Leeds, published in the May number of the Journal of the American Chemical Society, the pollution of the Jersey City supply is somewhat greater than that of Newark, and it has an effect on the deathrate, as is shown by comparison with the deathrate of Hoboken, which last city has had a purer water-supply since 1882.

This matter of the pollution of the Passaic River has been several times discussed in this journal during the last eight years. There is no doubt that a sufficient supply of pure water can be obtained for all the cities which now depend on the impure waters of this stream. We have also no doubt that if the present system of supply to these cities be continued the result will be disastrous to their commercial prosperity, because of the reputation for unhealthfulness which they will soon obtain, if they have not already done so; but it will probably require a positive demonstration of this in the shape of the loss of a number of lives and marked depreciation in the value of property before anything will be done in earnest to remedy the evil.

If a few cholera cases occur in Paterson or Passaic and the discharges from them gain access to the river the evidence furnished by the results will probably be quite sufficient to convince even the most conservative citizens of Newark and Jersey City not only that they are drinking dilute sewage, but that it is, in the long run, a very unhealthy and expensive beverage. In awakening a popular interest in this problem, the recent articles in the New York Sun have been very timely.

THE ILLINOIS RIVER IMPROVEMENT CONVENTION.

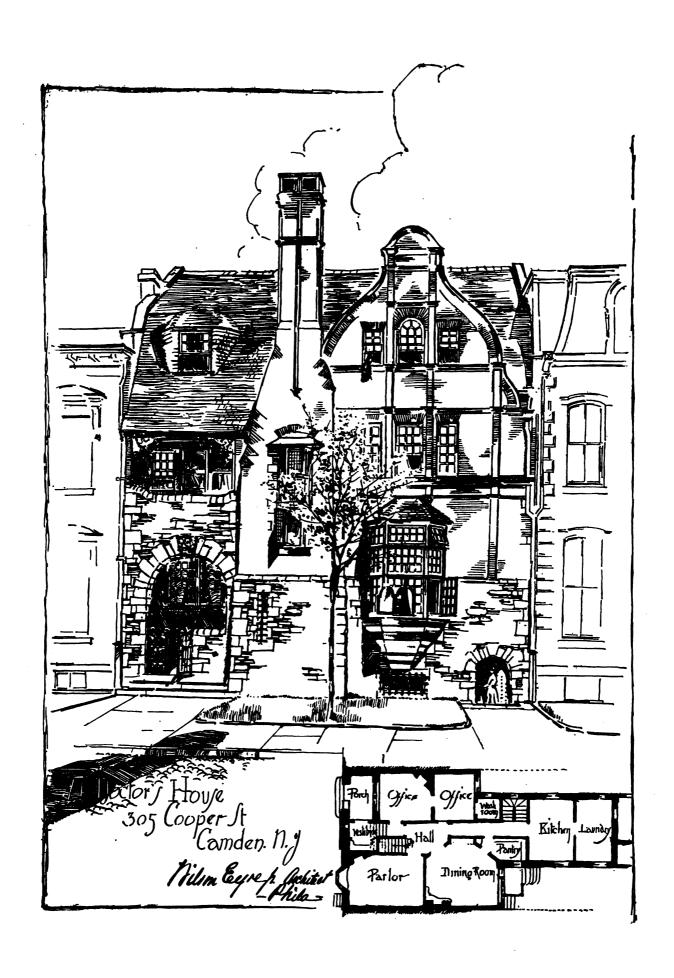

This body met at Peoria, Ill., and, as a result of its deliberations, passed a series of resolutions announcing the conviction of its members of both the necessity and wisdom of the improvement by the general Government of the natural waterways of the country, and the construction of canals in locations where they partake at all of a national character.

The rivers specifically named are the Desplaines, Illinois, and Mississippi, and the canal particularly mentioned is the Hennepin. The grounds for advocating these schemes are not only commercial, but they are claimed to be necessary as means of national defence.

In a former issue we printed the substance of a report by a Board of United States Engineers, composed of Generals C. B. Comstock and O. M. Poe, and Major J. C. Post, on the Hennepin Canal, which fully endorses the desirability of its construction.

THE ENGINEERING AND BUILDING RECORD fully believes in the policy of a very wide extension of the routes for inland navigation, not only as a check upon railroad charges, but for the reason that in many cases they furnish the readiest built and cheapest communication to small and remote communities. It cannot be that the policy so universally recognized and acted upon in Europe is a mistaken one, and in this respect we may draw a lesson from the Old World.

TRANSACTIONS OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.*

MR. WILLIAM H. CROSSLAND'S paper on the Royal Holloway College gives an account of the ideal manner in which Mr. Holloway, his client, allowed him to construct this building.

The early French Renaissance was the style chosen by the architect and accepted by Mr. Holloway. Before Mr. Crossland started the design of the building his client required him to spend two or three months sketching and measuring the chateaux of the Loire. All the principal chateaux were studied and complete drawings of Chambord were made by the architect and his assistants. Two years for the study of the design were allowed the architect, and not until all the detail drawings were completed was the work begun. In accordance with the excellent English practice the contract was based upon quantities of material furnished by a quantity surveyor, and Mr. Holloway paid the salary of a clerk of the works, whose duties were strictly confined to the superintendence of the construction. The architect had a bungalow built and went into residence on the spot.

The stone-cutting was done at the site. The sculptor who modeled all the decorative details had his studio at the building. Five years were spent in the construction of the building, and from the beginning until the end the client was on the works but four times. As his result, Mr. Crossland has produced a well-planned and well-massed building, with much interesting detail in the manner of the style he adopted. But, judging from the published views, he has not given the *spirit* of the period he chose to copy to the work as a whole.

The paper by Mr. John Phillips, C. E., treats upon the "Drainage of the Palace and City of Westminster," which has been illustrated and described in these columns.

Mr. T. G. Jackson gives an extremely interesting paper upon the "Architecture of Dalmatia." Except through a slight sketch by Professor Freeman, Dalmatia has been known to architects only through Diocletian's palace at Spalato.

Mr. Jackson shows that there are many monuments unique and interesting both to the architect and the archæologist. From him we learn that much beautiful and highly perfected Romanesque arch and some very original Kenaissance buildings are to be seen there, and, what is of most curious interest, that the Romanesque was practically the prevailing style in all important buildings from the day Diocletian's palace was built until the adoption of the Renaissance style.

The latest Romanesque arch in Dalmatia dates from 1400-1409. At that time the French were building in the Flamboyant style, the English in the Perpendicular. Ghiberti had won the competition for the Gates of the Baptistery at Florence. Brunnellechi had gone to Rome to study the remains of classical art, to return to build the dome of the Duomo; the Renaissance was about to be.

Thus the ancient round-arched work of Dalmatia almost meets the new round-arched work of the Classical Revival.

Under the rule of Venice, the Venetian Gothic was introduced mainly in domestic work. In one great church only, the Duomo of Sebenico, is used the Gothic style, and of this church only the lower parts of the nave and the aisles are Gothic, the rest being finished by a Renaissance architect. The Gothic part was built between 1430 and 1441. The Renaissance style was no sooner established in Dalmatia than it displaced the Gothic style for all buildings of importance.

Savs Mr. Jackson:

"The Dalmatian Renaissance work is eclectic from first to last; pointed arches and trefoil cusps are found combined with fluted pilasters and shell-headed niches, and classic entablatures surmount arcades that might have been constructed in the fourteenth century. However strangely mixed the elements of the designs may be, they are happily combined with a true artistic instinct, and, taken together, they produce a consistent and harmonious whole, which owes perhaps not a little of the effect it produces to the piquant assemblage in unexpected agreement of elements that might have been expected to disagree.

"The Renaissance art in Dalmatia continued, as it had begun, free from the shackles of a rigid formalism. It never developed, as it did in Italy, into pure Palladianism, till, in the latter part of the seventeenth century, it suddenly sunk into the slough of the 'Barocco,' in which all its life and beauty was at once smothered, and architecture as a fine art ceased to exist."

*Vol. III. New Series.

Through all its different phases architecture in Dalmatia was inspired by the forms used in Diocletian's palace, and there seems to be no doubt that the existence of this great monument as a model was the one main cause of the constancy with which this people clung to the Romanesque style till the end of the fcurteenth century, and of the promptness with which they rejected the pointed arch when the Renaissance brought the round arch into use again.

Mr. Jackson's paper is extremely interesting, and points out a mass of rich and suggestive material for the study of our architects, who are nothing if not eclectic, and so should be the gainers by the study of the unconscious eclecticism of these old builders.

We are glad to see that Mr. Jackson has published lately a large work upon Dalmatian architecture.

THE NICARAGUA CANAL EXPEDITION.

THE following is the personnel of this expedition which sailed November 30 on the steamer "Hondo," expecting to arrive at Greytown in about ten days, stopping on the way at Jamaica and Fortune Island to pick up some 100 laborers to act as axemen, porters, etc.:

Lieutenant R. E. Peary, U. S. N., Sub-Chief Engineer of the Nicaragua Canal Construction Company, commands the expedition. Chiefs of parties are: J. Francis Le Baron, Domingo G. Cartaya, Frank P. Davis, J. W. Pethard, Garnett Savage, William J. Maxwell, J. F. Perez.

Assistant Engineers.—W. V. Alford, J. G. Holcomb, F. T. Bernhardt, H. C. Miller, P. H. Bevier, McDonough Craven, Ricardo Molino, H. C. Litchfield, Culixto Guiteras, A. J. Menocal, E. M. Hunt, J. T. Ford, F. W. Bennett.

Rodmen.—P. B. Cooke, Enrique Cole, Emil Diebitsch, Paul Spicer, William McCawley, P. R. Van Wyck, Jr., Perry Fuller.

Chainmen.—Louis William Mohun, G. B. Stratton, John M. Murphy, R. J. Wilson, Daniel B. Macauley, Harry W. Johnson.

Surgeon.—William Nicholson, M. D. Cierks.—J. Crowninshield, Charles E. Kern. Draughtsmen.—A. A. Aquirre, H. D. Murphy. Leadsman.—Iohn Kirk.

New York Herald Correspondent .- W. N. King, Jr.

These gentlemen are under contract with the Construction Company for nine months, by which time it is presumed the surveys will be completed. One hundred and twenty-five thousand dollars has been provided to defray the expense.

Notes of the survey will be forwarded to New York as fast as taken where the location will be determined: y the Chief Engineer, Mr. A. G. Menocal, Civil Engineer, U. S. N., and then staked out accordingly on the ground at Nicaragua.

The proposed route extends from Greytown, on the Caribbean Sea, to Brito, on the Pacific. Its total length is 169.8 miles. The Lake of Nicaragua, 110 feet above the mean level of the sea, will be the summit level, and the rivers flowing into and from the lake will be utilized to the best advantage, in order to reduce the actual canal excavation to the least possible limit. A system of locks on either side of the lake will be constructed, of such dimensions as to give commodious passage to vessels of the size now used for ocean navigation in Europe and America. The bottom width of the forty miles of canal will vary from 80 to 120 feet, and the surface width from 80 to 288 feet, with a depth of from 28 to 30 feet, but the 129 miles of river and lake will form a waterway safe for rapid navigation with ample depth throughout. The total cost is estimated at \$64.036,197, and the time required at six years.

THE Commercial and Industrial Museum at Antwerp has just been opened.

An exhibition of apparatus for preventing accidents in breweries and other works is to be held in Berlin in 1889.

OUR SPECIAL ILLUSTRATION.

CHATEAU D'ECOUEEN, MAYENE, FRANCE.

A DOCTOR'S HOUSE, CAMDEN, N. J.—WILSON EYRE, JR., ARCHITECT,

THE NEW DRY-DOCKS AT HAVRE.

WE translate the following from the Genie Civil of October 29, believing that, with the dry-dock just completed at the San Francisco Navy Yard, those being built at Norfolk and Newport News, and the one for which ground is just being broken at the New York Navy Yard, it will be found of timely interest, especially as "Dock No. 5" is believed to be larger than any in this country, except the Newport News one and that at Red Hook, Brooklyn, which are 600 and 610 feet long, respectively. We propose to describe one or more of these docks in later issues. The designs for the Havre docks were prepared by M. Maurice Widmer, Engineer in Ordinary of Bridges and Roads, under the direction of M. Quinette de Rochemont, Engineer in Chief. The work was executed under their direction and that of Superintendent Delorme by Messrs. Hallier and Letellier, assisted by Messrs. Biehler and Reignard. Figures 1 and 2, which we have had redrawn, are a general section and plan of the work, while Figs. 3 and 4 are photographic reproductions. Figure 3 is a view looking west and shows the condition of the work on the 30th of November, 1886, when the excavation was nearly completed, and Fig. 4 is a view looking east, taken June 30, 1887, while the concrete bottom was being put in.

The docking facilities of the port of Havre consist of four dry-docks built by the Government, one careening platform, one floating dock, and three careening pontoons. Three of the docks are located in the basin of the citadel, the longest being only 70 metres. The floating dock in the Barre basin is 65 metres long, and can only be used for vessels not exceeding 1,500 tons. Only the fourth dock, or No. 4, built in 1864, and 130 metres long on the keel blocks, can receive the large vessels of the Compagnie Transatlantique. The vessels recently built by this company, such as the "Champagne," 155 metres long, can only be received in this dock by removing some of the stone-work at one end. The constant increase in the size of the vessels frequenting the port of Havre has made it necessary to construct larger docks, and it is this work now being done on the two new docks, Nos. 5 and 6, that is here described.

This work was placed in the hands of Messrs. Adrien Hallier and Eugene Letellier, contractors for public works, and is briefly summed as follows:

First-Dock No. 5 and part of its entrance.

Second-Dock No. 6 and its entrance.

Third—A sump to receive the drainage from the two new docks.

Fourth—Conduits connecting the docks with the above sump and the present sump.

Fifth—The streets, working platforms, etc., around the docks.

Sixth—The removal of the stone coffer-dam at the head of the entrance of Dock 5, and that part of the wall east of the Eure basin, and between the entrance walls of Dock No. 6.

The following table gives the principal dimensions:

Name.	Dock No. 5.	Dock No. 6.	Remarks.
Entrances.	Metres.	Metres.	w the mean
Total length	25.80	25.80 16.00	B 4

	•	, 1	

Each dock includes the floor, the entrance, two parallel side walls united at the side opposite the entrance by a semi-circle, large offsets with material slides, four flights of stairs, two entrance conduits, two conduits to connect the dock with the sump, and, lastly, the sump itself.

The concrete bottom with its brick facing has a thickness of 3^m·15 at the centre of each dock. Each dock has a rudder-pit, which is drained by connecting with the conduits under the side walls. Large cranes will be set on the south embankment of Dock 5, and on the north embank

ment of Dock 6. The two inlet conduits of each dock are cylindrical, opening at the Eure Basin end below the water, and at the other end below the bed of the dock.

The Eure docks are emptied by means of pumps, but the present apparatus is not sufficient to drain Nos. 4, 5, and 6. Proposals have been invited for an apparatus capable of draining Dock 4 in three hours.

The rudder-pits in the two new docks are to facilitate the unshipping and shipping of the rudders of vessels for repairs, etc.

GENERAL CONDITIONS OF THE ENTERPRISE.

Two problems had to be solved by the contractors. One consisted in the extreme difficulty, under the conditions existing, of finding room for the plant. On the west was the Eure Basin; the use of the ground between Docks 4 and 6 was forbidden in the specifications. There remained therefore only part of the ground between Dock 5 and the Tancarville Canal, the width of which was 22m. at one end and 15m. at the other end. On the remaining side there was only a space 7m wide. The clear space north of Dock 4 had been set aside for a temporary dumping-ground for excavated material. The contractors therefore had only a passage 7m. wide at their disposal for the tram-road, and this could not be extended more than 100m., or it would have interfered with a swingbridge over the Tancarville Canal. As a result all excavated matter had to be taken out on the south side, and on this single space 7m. wide.

The experience of the enormous drainage and filtration encountered when the Bellot Basin was excavated lent additional interest to this work, and, contrary to its usual custom, the Government had included the drainage in the contracts with the excavation, and this constituted the other difficulty on account of the large filtration likely to be met with, not only on account of the proximity of the Eure Basin, Dock No. 4, and the canal, but because a bed of gravel and sand, easily permeated by water, had to be encountered, which had formerly in other work given great trouble. A drainage system was early inaugurated by the contractors, which alone made it possible to lay the beds of the docks. Work was begun on the north side of the docks, and the drainage systems were so arranged from the start that all waters, surface and otherwise, were drained toward a given point, from whence they could be pumped out. This was also necessary, on account of the small space at the disposal of the contractors for the moving of excavated matter. Work was then started on the south

The ground consisted of a sandy clay, interspersed with beds of peat, until the gravel, already alluded to, was reached, on which the foundations of the docks were laid. This ground stays firm and dry on a slope of 45°, and could be spaded out, but the Government deemed it prudent, to prevent any possibility of the ground's sliding, to cover the slopes with basket-work mattresses, which it did at its own expense.

After a general excavation over the whole surface of 1mby hand, an excavator was set to work on the south side. This machine dug a trench 30m wide and 5m.50 deep, or 25,000 cubic metres. The north side was excavated by the aid of dump-cars drawn by a 15-ton locomotive and filled by hand. Each car held 2 cubic metres of earth. On this side 26,000 cubic metres were taken out. The two excavations were pushed from opposite directions transversely until there only remained a bank 12m wide between them. (See Fig. 3.) This bank was then gradually taken away, with the help of large wagons, until there only remained enough on which a track could be laid to run cars for further excavation. Finally even this ridge was removed, the earth being run out on the inclined planes, which had then been built.

From this time on the contractors organized two provisional systems to get rid of the now very abundant water—namely, by means of ditches and pumping apparatus.

At this point ends what may be called the first period of construction. There now remained to be executed the excavation of the part left between the top of the embankment of Dock 6 and the ditch made by the excavator, also the deepening of the trench at the sides to —5^m·10 for Dock 5 and to —4^m·25 for Dock 6. Then the laying of the beton beds, and the final arrangement of the drainage.

The order of the work was not followed as above recounted, because it was possible to carry on much of it simultaneously.

The first work was executed by hand with the help of large wagons, but presently, as depth was gained, the

wagons were replaced by an inclined plane of om.13 to the metre, which permitted of all further excavation except a ridge for tramway.

The rest of the excavations were done by hand by Hallier's system of cars on inclined planes. These inclines were established on the south side of the work, the inclines being 1^m·75 base to 1^m· height, with a gauge of 0^m·40. There were six inclines, working in groups of two, each running three cars. Each plane had two tracks, serving alternately for loaded and empty cars. A locomotive drew a train of eighteen cars from the excavating

transmission shaft, run by two stationary engines, one for each group of three inclines. This did not prove satisfactory, however, and an eight-horse-power hoisting-engine was placed at the head of each incline. The boilers were vertical and had twenty-four square metres of heating surface, one boiler furnishing steam for two engines. It required eight horse-power to operate each incline, except for incline No. 7, which required twelve horse-power. The amount carried on the inclines from January 4 to July 31, 1887, was 95,000 cubic metres.

In this manner the work was pushed until the terracing

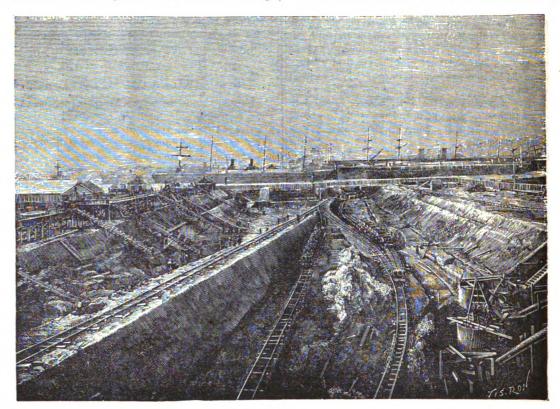

FIGURE 3.

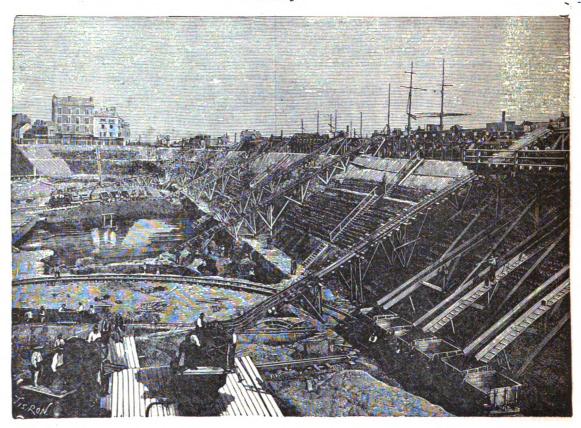

FIGURE 4.

point to the inclines, leaving six at each group of two, then drew away the empty ones in the same manner.

A seventh inclined plane, more strongly constructed than the others, for special heavy service, was located in the south-east angle of the excavation. The reason for having this incline in this location was to push the excavations on that side rapidly. The cars in this case are pushed into a cul-de-sac in sections of six and then run out together.

An attempt was made to use some old machinery for operating the six first-described inclines by means of a of Dock 5 was complete and part of No. 6. At the same time the rudder pit of No. 5 was being excavated.

The laying of the bed of No. 5 was accomplished during the further excavations in No. 6. Then, in order to avoid any break in the work, and to prevent any filtration, the laying of the concrete was begun at the eastern end and carried on without intermission, covering the entire bed of the dock. The mortar used was composed of 500 kilogrammes Portland cement to a cubic metre of sand. The concrete was made up of three parts broken stone to

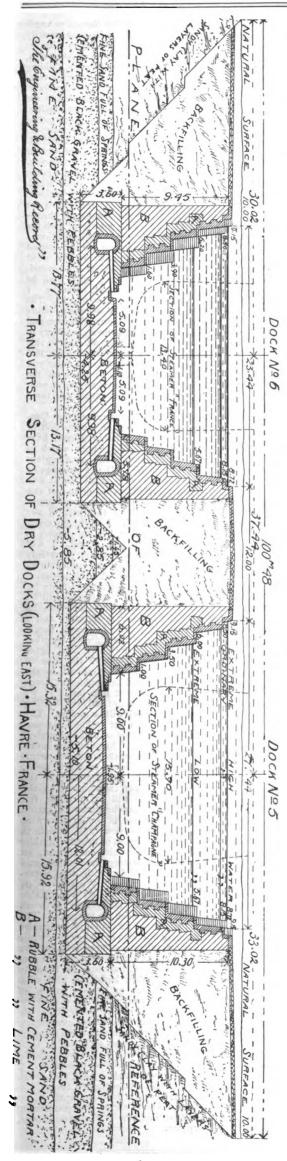

Fig. 1

two parts mortar. The contractors were greatly impeded in their concrete-making by want of space, and most of this work had to be done down in the south-west angle of the excavation.

The concreting plant consisted of six mortar-mixers, each two being run by a fifteen-horse-power engine. The six machines produced 150 cubic metres per day of eleven hours, and supplied, by means of special cars and track, three concrete-mixers; these latter produced 360 cubic metres of concrete per day.

The concrete-mixers discharged through shoots o m-80 wide into cars, each of which held two cubic metres. These were run on a track laid on a ridge that had been kept at the bottom of the dock on the south side. The concrete trains each consisted of six cars, a loaded train running out and an empty one back, propelled by 7-ton locomotives, on a track of one metre gauge. As the dock-bed was concreted the track was removed.

It took 33 days and 11,000 cubic metres of material to concrete the bed of No. 5 Dock. During this time the inclines were in operation, only interrupted long enough

relief-pumps, was of 50 horse-power. They were originally condensing engines, but it became necessary, on account of the constant work, to remodel them so that they could be worked either as condensing or as high pressure.

The pumps discharged 25,000 cubic metres per hour, the engines running at 120 revolutions. The water was pumped into a reservoir, and from thence by a subterranean conduit was discharged into the Tancarville Canal.

The sump to receive the drainage of the docks was a special work. Its close proximity to the Government's plant for emptying Dock No. 4 made it necessary, for prudential reasons, to use a special caisson on that side, which was first worked openly, but finally with compressed air.

On the 1st of last September the bed of Dock 5 was complete, and nearly all of the bed of Dock 6. The rudder-pit of No. 5 was finished, and that of No. 6 in process of excavation by compressed air. There then remained to finish the entire work, the excavation for the side walls of No. 6, the removal of the Eure coffer-dam, the clearing away of the old side walls and masonry, and the completion of the emptying conduits which the contractors

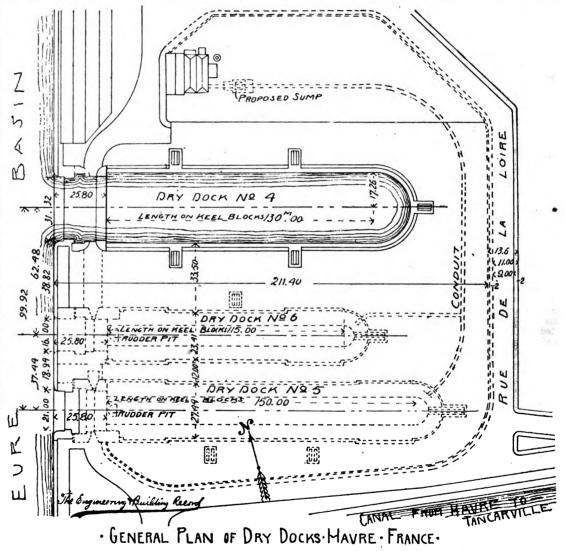

FIGURE 2.

when one was reached by the concrete gang to raise the lower end to concrete beneath it, and then replace the same.

The last portion of the work was the building of the main sump. The specifications required that the contractors should keep the infiltrating waters drained down to $-7^{\text{m.io}}$, or $2^{\text{m.io}}$ below the bottom of the excavations. The main sump is circular and is sunk to a depth of $-10^{\text{m.io}}$. It has a sheathing of plate-iron $0^{\text{m.io}}$ below the bottom of the excavations. The main sump is circular and is sunk to a depth of $-10^{\text{m.io}}$. It has a sheathing of plate-iron $0^{\text{m.io}}$ blick and $1^{\text{m.io}}$ high. The main drain between the two docks was so arranged as not to interfere with the rest of the work, and drained into the main sump. It also carried off the waste water from the four pumping systems; each system consisting of two connecting-pumps.

The pumps were furnished by the Messrs. Dumont. Six were of the type No. 10, and the other pumps, only to be used as reliefs, were of the type No. 8. The discharge-pipes of the first were om-30 diameter; the two other were om-25 diameter. The engines, placed on concrete foundations some distance back from the excavations, were furnished by Messrs. Weyher & Richmond. Three were of 70 horse-power, and the fourth, designed for running the

expect to accomplish in a braced open cut, except at the junction of the two sumps, which would have to be done with compressed air."

Messrs. Hallier & Letellier are highly complimented by the writer of the article in the *Genie Civil* for the excellent manner in which they have surmounted the difficulties in their way and have quickly accomplished their work in spite of limited space and infiltering waters.

PARAMOUNT REQUIREMENTS OF A NA.
TIONAL BUILDING FOR CUSTOM-HOUSE,
JUDICIAL AND POSTAL PURPOSES.*

BY M. E. BELL.

(Late Supervising Architect, U. S. Treasury Department.)

Mr. President and Professional Brethren:—The Secretary of our Institute has selected as the subject of this paper the "Paramount Requirement of a National Building for Custom-House, Judicial and Postal Purposes." The obligation was suggested to me, no doubt, because of my late incumbency of the office of Supervising Architect of the Government at Washington, and because nearly four years of my life has been devoted wholly to the work of that office, which, at this time, has upwards

*A paper read at Convention of American Institute of Architects, Chicago, October, 1887.

Digitized by Google

6

of eighty such buildings under its management and in course of construction. By referring to my subject in detail, I find that I am requested to treat of "paramount requirements" as regards site, construction, disposition of space, arrangements of water-supply, day and night illumination, ingress and exit, heating, ventilation, hygiene generally, and provision against conflagration, as well as any other points involved in this special theme which my studies and experience have led me to class as important. I confess at the start that I hesitated long and seri-ously before accepting such an obligation, because I think when all the subjects mentioned are thoroughly digested, including those that I might class as important, there is very little left to discuss from the practical standpoint of our profession; and when the obligation is coupled with the request, oft repeated, that the paper shall be a short one, the obligation seems all the more difficult.

I have accepted it, however, not that I have hopes of presenting anything novel or entertaining to this convention, so many members of which are twice my own age in the practice of our profession, but with a most sincere desize that the subject of our national architecture shall be taken up at this time, treated of, agitated and talked over until our ideas are crystallized and put into practical shape, so that they can be understood and considered by an in-telligent public and their representatives in Congress. The whole theme is so grand, so ennobling, so far-reaching in its results for the glory of our profession, that to be

brief is well-nigh impossible.

The obligation includes a hasty treatment in detail of each subject suggested, and necessarily involves the coneach subject suggested, and necessarily involves the consideration of the Architectural Department of our Government at Washington. After the bill for the erection of a national building has become a law, the question of a proper site is the first consideration. The system by which the sites have been generally selected was, for the Secretary of the Treasury to appoint a commission of not less than three not more than seven contlemen residents of the city where than seven gentlemen, residents of the city where the building is to be constructed, with instructions to recommend a suitable site, and, in most cases, the recom-mendation of these gentlemen has been approved. Theoretically, it is quite natural to suppose that the genthemen so selected would perform their part with honor to themselves and to the satisfaction of the department. The themselves and to the satisfaction of the department. The facts do not bear out any such supposition. The question of what the site was to cost, and its relation to the total amount of expenditure fixed for both site and building, rarely entered into the question with them, excepting, perhaps, to see that the price paid was not exorbitant. Such committees were nearly always swayed by personal interest, local influences, such as a newspaper, a brother member of the church a warm personal friend a poor member of the church, a warm personal friend, a poor widow woman, or some other creature that was found to be the governing cause in the case. The sites so selected were frequently of insufficient area, at times largely in excess of what they should be as to cost, not properly located for Government business, nor for the accommoda tion of the public; examples of which are to be found all over the country. When the site selected was found to be over the country. When the site selected was found to be too small, it was after the buildings had been constructed, and the Postmaster and other Government officers attempted to transact business in their new quarters. obtain then additional grounds and enlarge the build-ing was the only alternative, and when accomplished, was always expensive, and seldom satisfactory. The system ing was the only alternative, and when accomplished, was always expensive, and seldom satisfactory. The system now in vogue is to advertise in local newspapers for a site for the new building, thus allowing those who may so desire to submit his or their proposal. A stated time is fixed when an agent of the department is sent to witness the opening and to hear what may be closed as a likely the complete of the department is sent to witness the opening and to hear what may be closed as a likely that the complete of the department is sent to witness the opening and to hear what may be closed as a likely that the complete of the department is sent to witness the opening and to hear what may be closed as a likely that the complete of the complet the opening and to hear what may be classed as public opinion. Each site is then visited and inspected by the agent and its price and eligibility taken into account.
Upon the written report of the agent to the Supervising Architect, and in turn his recommendation to the Secre tary of the Treasury, action is taken, and the question of site, so far as the Treasury Department is concerned, is

All papers are then given to the Attorney-General, and All papers are then given to the Attorney-General, and upon his certificate that the title is valid, the site is paid for. The paramount requirements are properly met by taking into account the area required for the present volume of business, and for future growth of population, and consequent enlargement of the building, which should always be well and carefully provided for. The site selected should be at the angle of a square, and with its main facades to the south and east, for proper light and the accommodation of the public. The area in all cases should be sufficient, so that an undivided space of not less than thirty feet can be th**e** public. that an undivided space of not less than thirty feet can be maintained upon the two inner facades, as a proper protection against fire from adjacent property, and for a proper circulation of air, and the admission of light. In considering the building proper, the question of the material entering into its composition will largely depend upon nai entering into its composition will largely depend upon its geographical location. It should always be a fire-proof building in every sense of the term, and so planned that additions can be added providing increased accommodations when necessary, while the architectural harmony of design is maintained or increased. The interior should be constructed of the most lasting and durable finish, such as polished domestic marble engagation tiles. polished domestic marble, encaustic tiles, terra-cotta and political control of the political states of the political states. Large openings in walls should occur wherever consistent with permanent and safe construction for a thorough diffusion of light. The floor and roof construction should be of iron or steel, fire-proofed, and with fillings of terra-cotta. In the important question of roof construction, the best results have been obtained by the

use of porous terra-cotta sheathing, set in lime mortar and bolted to T-irons, the whole surface covered with coal, tar r pure asphaltum, with roofing prepared paper, rolled on hile the tar or asphaltum is still hot. The paper will while the tar or asphaltum is still hot. The paper will then adhere perfectly and prevent the passage of moisture, fine drift snow or rain. After the paper is applied the valleys, hip-rolls, gutters and flashings are formed in copper when the whole is slated with 18 thick slate, bolted to place with bolts having countersunk heads and with nuts and washers. When so constructed it can be safely plastered upon the under side, will be durable, and will be found to assist very materially in the heating and ventilating of the building during the cold season, and in the end will be found to be the most economical. In this respect, however. I do not place myself in connection with those The paper will however, I do not place myself in competition with those architects who employ the flat roof or no roof at all. To me any detached building where the climate is as it is in every locality of our country, without a roof to be seen is an architectural innovation. In the distribution of floor space, the basement will be generally occupied for storage purposes, heating, ventilating and lighting apparatus, elevator pumps and machinery. The first floor of the building should be sufficiently elevated, so that the basement can be well lighted without areas, making it available for practical use, and giving a more imposing exterior. It will be entirely taken up by the Post-Office Department, with its main working room, Postmaster's public and private office, the Assistant Postmaster's room, Money Order and Registering Department, Mailing Clerk's retiring room, with stairs, halls, and elevators The second story will provide accommodations for the Internal Revenue Collector's offices, the United States Marshal's public and private office, and quarters for the United States Coast Survey. The third story will be arranged to accommodate the United States District and Circuit Court, with private rooms for the judges, their clerks and library, the United States District Attorney's room, besides lawyers' consulting room, with witnesses' waiting-room adjacent, jury room, halls, stairways, and elevators. The heating of the building should be, in nearly all cases, a low-pressure indirect, mechanical steam-heating and ventilating apparatus. The boilers and all the radiators should be massed in the basement, and by means of a fan the atmosphere of the entire building should be placed in a plus condition, and the supply of fresh air and the ventilation regulated as required by the temperature upon the exterior. The supply should be distributed at the ceiling in all cases, while the ventilation is operating at the bottom of rooms and hallways. The lighting of the building should be by the incandescent electric light, the entire plant to be the property of the Government, and under the control of a property of the Government, and under the control of a competent engineer in charge of the heating apparatus and elevator machinery. Provision should be made for rain-water supply, by the construction of large cisterns outside of the building, into which all conductors should discharge. The tank in the attic should be provided with nine and connection hose on the different floors for use in pipe and connection hose on the different floors for use in case of fire. For other purposes the city water-supply generally proves everything that is desired. What may be considered as the "paramount requirements" of the building in question, then, can be properly condensed into three prime factors: First, a sufficient sum of money; second, architectural knowledge to properly apply it; and lastly, legislative authority, such as is sometimes obtained by accident, seldom by intention. With these three facone, and would be understood as well for a national building as for any other. That they are not given factors in the problem is known to you all, and further treatment of the problem is known to you all, and further treatment of my subject brings me at once to the consideration of the present system by which our national buildings have been, and are now being, constructed. As to the question of money available to construct a building, it is a fact that as many bills are passed by Congress and become laws, authorizing the construction of buildings, restricting and conditioning with great caution the expenditure, and yet omitting to appropriate one dollar, as are passed where the total amount to be expended is appropriated and omitting to appropriate one dollar, as are passed where the total amount to be expended is appropriated and made available as it should be. The great majority of bills that are passed, and by which the Treasury Department is governed, for public buildings, appropriate only a small percentage of the amount fixed in the bill, as the total limit of cost. It is evident therefore, that the Architectural Department of the Government cannot be alled to account for the notorious delays and consequent. additional expense in their construction. Having authorized the erection of a building, why should not the full amount required for its construction be appropriated, so that the work of construction may be carried on with dispatch, and upon sound business principles? That it is not so is a most unaccountable fact upon any other than political grounds. The Lower House of Congress being not so is a most unaccountable fact upon any other than political grounds. The Lower House of Congress being Democratic and the Senate Republican are trying to make a record for economy in appropriations, and while it is possible to pass bills for necessary building, the appropriation committees decline to appropriate the money, and, in my judgment, must assume the responsibility for everything resulting from a policy of inadequate and dribbling appropriations. In considering the second requirement appropriations. In considering the second requirement, that of architectural intelligence, that of the Supervising Architect of the Treasury should be without limit. Under the present system this is certainly a "paramount necessity." He should be so endowed, that at will, should Congress vote the erection of forty buildings at one time, as did the Forty-Seventh Congress, his ability will be sufficient. With eighty new buildings in course of construction, he is expected to make no mistake, and to do all the archi-tectural work with the same facilities that were once re-

quired for ten buildings. What may be classed as architectural is but one portion of his work; he is necessarily an executive officer, and attends personally to a correspondence of upwards of three thousand letters per month, besides hearing contested cases of contractors, holding counsel with Congressmen, Senators and other Govern ment officials. His immediate official superior, the Secretary of the Treasury, may require some education in the ethics of architectural details with which he is not familiar, ethics of architectural details with which he is not familiar, and it is one of the duties of the Supervising Architect to be especially devoted to his case. If, as in my own experience, there should be a Folger, a Gresham, a McCullough, a Manning, and a Fairchild in the space of four years, his duties in this regard are not lessened. Concerning his professional brethren criticism has generally fallen upon him for the architectural taste or style which building it is the crowning element in its relation to the public, posterity and history. How important, then—paramount, indeed—that it should be consistent with the requirements of our people and their peculiar institutions! There should be, in my humble judgment, no hide-bound fetters holding our national architecture to the rigid rules of the classics, but an absolute freedom and emancirules of the classics, but an absolute freedom and emancipation of design in which the governing spirit shall be that of utility, durability, truthfulness, and harmony. I abhor a false window as I do any other kind of a lie. The national building, therefore, should, in its every feature of design, be of a style consistent with our education and our highest art and culture. The time allotted to this paper is so limited that for further information upon this factor of national buildings I am compelled to refer you to "The History, Organization, and Function of the Office of Supervising Architect" of the Government, published by the office in the year 1886, and obtainable there

on application.

As to the third condition, it is paramount that Con-As to the third condition, it is paramount that Congress, in order to embrace in a bill for the construction of a national building the proper legislation, should have sufficient data and knowledge of each case upon which to base an opinion. The facts are, that in the past Congress has seldom sought such information. If the language of a bill and the limit of cost were as they should be, it was purely accidental, the general intention being to get the building started and correct everything at some future purely accidental, the general intention being to get the building started and correct everything at some future session. The unsatisfactory result of this part of the present system are known to you all. I might go much more into detail by way of illustration, but our country is full of object lessons, and time will not permit. I will close with but a few remarks as to a remedy. Certainly nothing will be done towards correcting the present system, until the architectural profession take the initiative and formulate something better, and the responsibility for its continuance rests solely upon them. Congress will be found willing to enact into law any bill which can be shown to be in the interest of a better architecture and a more economical administration. The first step, theremore economical administration. The first step, therefore, is for the American Institute of Architects, together with the Western Association, to formulate and agree upon a measure which meets every phase of the case in detail, and which, when presented to Congress, will be the basis upon which every architect and the public at large can intelligently demand its enactment into law. If we ourselves are incapable of this, complaint and fault-finding with the present system and its work will be useless. objects to be attained are a higher art in the National Building Architecture and a more effectual and economical administration in their construction. The public are much more interested in this matter than are the architects them-Selves, and ignorance of the subject is our enemy to fight.
Our architectural journals and the public press are the Our architectural journals and the public press are the means by which to get the proper information to the people, and when there its effect will at once be felt in Congress. Personally, I have not hesitated to go on record in my reports to the Secretary of the Treasury as to what, in my opinion, should be done and which in general terms is to create a commission or board of public buildings, composed of the Supervising Architect, an assistant supervising architect, a heating, ventilating and buildings, composed of the Supervising Architect, an assistant supervising architect, a heating, ventilating and sanitary engineer, and a master builder, with the Secretary of the Treasury as ex-officio member. We are happily reaching an age of specialties, and it is but reasonable that those who are experts in a special branch of work should be the safest and best guides to success. The combined intelligence of such a board will justly inspire confidence in the public mind and also in Congress, while our profession can safely trust the question of competitive plans to their judgment. I am as much opposed to a promiscuous competition for a national building as I am to miscuous competition for a national building as I am to one for a private or any other public building, and what architect, who has obtained by ten or twenty years' of laborious study, hard work and responsibility a just reward in reputation, would care to risk it with those soto gain. There should, therefore, be a standard adopted to gain. among architects which shall determine effectually their claims to the title, upon the corner-stone of which should be inscribed indelibly the words Honesty and Ability.

Life is too short for further delay. Let the work

Life is too short for further delay. Let the work already performed in this direction be weighed for what it is worth; but let not this convention adjourn until it has gone on record as to what it knows about the paramount quirements of a national building for custom-house, judicial and postal purposes.

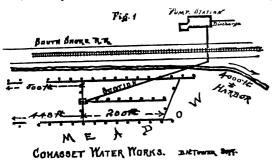

RECENT WATER-WORKS CONSTRUCTION. No. XV.

COHASSET MASS.*

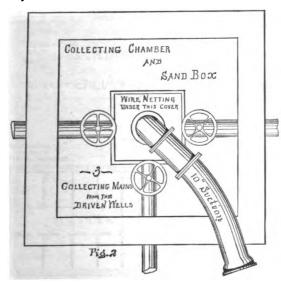

This pretty seaboard town lies on the line of the Old Colony and South Shore Railroads, about an hour from Boston, and contains some 3,000 inhabitants. There is no manufacturing and scarcely any trade or commerce in the place, but it furnishes a home for Boston merchants, and the remnants of a once profitable fishing business may be discovered by the curious observer.

The usual preliminary talk about a water-supply for the town began about two years ago, but not until the close of 1885 was any important step taken. At that time Mr. Daniel N. Tower, a civil engineer, well known along the South Shore, took up the matter in earnest, and, having succeeded in enlisting Mr. Charles S. Bates, a wealthy summer resident, the construction of a first-class system of water-works was assured. Work was fairly begun in May, 1886, and the main lines, reservoir, and pumping-station were completed by December. The work of laying services has been commenced. The interesting portion of the plant is found in that devoted to supply.

In a meadow lying on the westerly side of the railroad, and forming an evident basin for no inconsiderable water-shed, are sixty-five driven-wells, 2 inches in diameter, 24

feet apart and driven from 30 to 40 feet deep. Four feet below the surface these wells are connected by horizontal cast-iron mains of diameters varying from 4 to 10 inches, and connecting, as shown in Figs. 1 and 2, with a sand-box and gate-house. As the water leaves the cast-iron sand-box through the 10-inch suction it must first pass through a screen of copper wire. It is worthy of note that an air-chamber on top of the sand-box, which was thought essential in the construction of the driven-well system at Hyde Park, has been omitted at Cohasset with good results. The meadow is nearly a mile from the salt water of the harbor, but its surface is only 4.65 feet above mean high tide. The brook shown in Fig. 1 usually runs dry in summer.

As a rule, the wells go through the following strata: Meadow muck, I foot; clay, 5 feet; sandy loam, 8 to 10 feet; gravel, I foot; blue clay, 10 to 15 feet, and then into a good water-bearing gravel of unknown thickness.

The pumping-plant consists of a brick engine and boiler-house, 26x49 feet, with 12-inch walls and a hip roof of 2-inch hard pine plank covered with selected slate, a Blake compound condensing duplex pumping-engine 8x16x8½ x12, capacity 750,000 gallons in 24 hours, and one boiler.

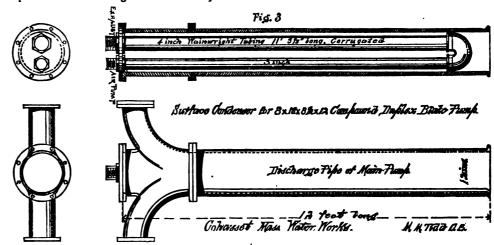

There are six miles of cast-iron mains, the largest being twelve inches in diameter. The reservoir is on the crown

*No. XIV., The Water-Works of Calais, Me., was published on page 519, issue of October 8, 1887.

of James Hill, south-east from the heart of the town and the pumping-station. It has a capacity of 1½ million galons, and is in construction identical with the one built for Hyde Park. Mass.

Plans for this and all other portions of the work were prepared by Mr. Tower under the guidance of M. M Tidd, C. E., of Boston, who was engaged as consulting engineer.

The reservoir was built and the street-mains were laid under contract with W. C. McClallan, of Boston, and the work was performed in a thorough and satisfactory mancrete by the Romans, and lava flags, as in Naples and Catania. Macadam was certainly condemned for heavy traffic in all large towns as being too costly in maintenance and too disagreeable owing to its dust and mud, choking of drains, making mud-banks in rivers, etc., and the tendency of the day was to substitute for it a noiseless pavement. The macadamized road of the Champs Elysées, Paris, now nearly all replaced by wood, cost for maintenance 17 francs per square metre per annum, say 13s. 8d. per square yard; that of the Boulevards, 6s. 8d. per square yard. The proper way to lay wood was upon a smooth cement concrete. Concrete was being used in Paris now as a foundation for granite sets, as in Berlin

ner. Much of the main-pipe trenching ran through hard granite ledges, and about 1,200 cubic yards of ledge was removed by "Rackarock" powder and steam-drills, at a contract price of \$3 per yard.

The works cost about \$75,000, and are owned by the Cohasset Water Company, of which Charles A. Welch is President, James H. Bouvé, Treasurer, Caleb Lothrop, Registrar, Charles S. Bates, Managing Director, and D. N. Tower, Superintendent.

PAVEMENTS AND STREET RAILROADS. No. XX.

(Continued from Vol. XVI., page 710.)
WOOD PAVEMENT IN THE METROPOLIS.*
CORRESPONDENCE.

The author having alluded to the wood pavement laid down by the Improved Wood Company in Paris, he would make some remarks on that interesting work, having watched it daily from its beginning. It had been carried out in September, 1881, on a portion of the Boulevard Poissonniere, of the Rue Montmatre, and a cross-road formed by the two. The gradient of the former was nearly four in 100. It had been laid by skilled English workmen, with the thicknesses of concrete and wood as above stated, and had resisted up to the present some of the heaviest traffic in the world. It was fair to state, however, that the winters of 1881–2–3 had been remarkably mild, and the summers of 1882–3 remarkably cool. In March, 1884, the first repairs had been effected, and now (July, 1884), although the road was in good order, some of the sets had become spongy, and those in the lines of traffic were rounded at the edges. On a wet day the wheels of the omnibuses, by expressing the surface-moisture, left seemingly white tracks behind them. Now, large surfaces of wood pavement were being laid all over Paris, chiefly in substitution of macadam, and four rival contractors were in the field. The price for all is as near alike as possible, say 23 francs the square metre, or 14s. 10d. the square yard; but it must be noted that the Paris octroi on cement was 12 francs the ton, and on wood 7 francs 50 cents the cubic metre, which increased the cost price by about 1 franc 50 cents the square metre, or say 1s, the square yard as compared with that of London. The system of deferred payments had been, adopted all round; the prime cost of 23 francs was spread over a period of eighteen years, interest and compound interest being allowed on both sides at the rate of 7 per cent. per annum. This gave two francs 35 cents per annum for first cost, to which was added for maintenance 2 francs 85 cents per square metre per annum for first cost and maintaining, for a period of eighteen years, or 3s. 1d. per square yard. This price had been subsequently increas

* A paper by George Henry Stayton, Assoc. M. Inst. C. E., and printed in the Minutes of the Proceedings

and Vienna. Wood might answer for wide, well-ventilated thoroughfares, but to use it for narrow streets was antihygienic. Wood absorbed the urine of horses and the diluted filth of the streets; horse-dung clung to it, and in dry weather it gave rise to horse-dung dust.

dry weather it gave rise to horse-dung dust.

For traffic, wood was excellent for the first two or three years, but as soon as it became fibrous and worn, like an old tooth-brush, it would certainly give off poisonous emanations under a hot sun, and remain damp in winter. It lacked that first quality for a hygienic roadway of impermeability; and was far less durable than asphalt; for Cheapside, laid in asphalt in 1878, had never been renewed, and its repairs had never stopped the traffic for one minute since it had been laid, whereas wood was entirely renewed in six to seven years. It might be safe-predicted that a reaction would set in against wood within the next few years. The Paris engineers stated in article 19 of their specification for wood pavements: "The administration reserves to itself the faculty of suppressing at any time any part whatever or even the whole of the roads paved with wood." He might add that the cost of the compressed asphalt pavement now being laid round and inside the new Hotel des Postes, Paris (about 10,000 square metres), consisting of a 6-inch Portland cement foundation and asphalt 2 inches thick was 19 francs 50 cents the square metre, say 123. 5d. the square yard, and the yearly maintenance for ten years 2 francs per square metre, or 1s. 4d. per square yard. In the Rue de Richelieu the two systems of noiseless roadways, asphalt and wood, had been laid this year side by side; a few years would prove which of the two possessed most dury blike.

foundation and asphalt 2 inches thick was 19 francs 50 cents the square metre, say 12x. 5d. the square yard, and the yearly maintenance for ten years 2 francs per square metre, or 1s. 4d. per square yard. In the Rue de Richelieu the two systems of noiseless roadways, asphalt and wood, had been laid this year side by side; a few years would prove which of the two possessed most durability.

Mr. H. Faija said that as it seemed to be admitted that the life of wood pavement was dependent, to a rather important extent, on the foundation on which the wood-blocks were laid, he agreed with the author that it was better to have good, clean ballast for the formation of the concrete, than to use the broken granite which existed in the old roadway, from which it would be hardly possible to make a good concrete. Even after the granite had been screened it was very dirty, and all the holes and interstices, which for the production of concrete should be filled with cement, were filled with dirt. Then, again, the screening removed not only the large pieces, so that to secure a sound concrete a much larger quantity of cement would have to be used than was necessary with the ballast. But as this extra amount of cement was not used, the concrete was very rough, very open, and consequently neither strong nor sufficiently smooth to receive the blocks; it was therefore necessary to lay a surfacing of sand and cement on which to set the blocks. This surfacing must, in time, break up and become reduced to powder, for it had not a thickness sufficient to resist hard wear, nor was it homogeneous with the concrete underneath. The author had stated the cost of the concrete at 2x. 3½d. The square yard, and it was therefore evident that if the concrete had to be relaid or materially repaired every seven years when the blocks were renewed, the maintenance would be considerably increased beyond the figures given in the paper; and might probably account for the high cost of maintenance which exist in the Holborn District. In fact, the concrete

WARMING THE WESTCHESTER COUNTY ALMSHOUSE BY HOT WATER.

On account of the interest now being taken in hotwater work we have gone to the trouble and expense of working up the heating-apparatus, etc., of the Westchester County Almshouse, at East View, Westchester Co., N. Y., just as it has been put in by the Denny Bros. Co., of this city, that our readers may have as great facility to see what has been done there in this line as if they visited the

Figure 1 is a plan of the rooms of the building that have been warmed by this system, and which have been tested during one winter, 1886-7. They comprise all of the rooms of the first, second and attic stories of the main building, and the first and second stories of the hospital building; the asylum wing being as yet heated by the furnaces. The building is a very old one, of solid masonry, and is in good repair.

Figure 2 shows the basement plan and the position of the pipes and boilers, as well as the male and female

coils. Its branches are 11/4 and 11/2 inches to the coils-11/4 inches to coils of 50 square feet and 11/4 to larger coils. The return-pipes are similar, but in this case are on or near

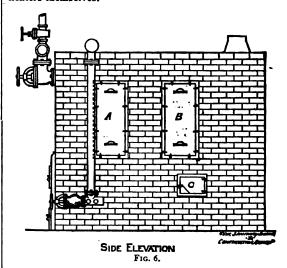

FRONT ELEVATION FIG. 5.

the floor so as to get the water back to the boilers, as the heaters are nearly as low as the bottoms of the boilers.

The loop a, Fig. 3, with air-chamber, was introduced for the purpose of quickening the circulation to the lower floor.

ence of the density of the water in the legs. The motive power, then, for the basement-considering gravitation as the cause of motion—is in the down-leg of this syphon and the pipes which drop to the coils and heaters and the heaters themselves.

The amount of heating surface on the first or principal floor, main building, is about 1,383 square feet, part Bundy hot-water radiators and part box-coils. A close study of the plan will show the different locations, the coils being

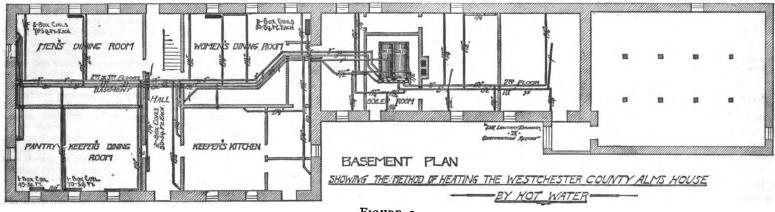

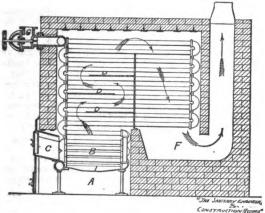

FIGURE 2.

dining-rooms, keepers', and other rooms that are warmed in the basement.

Figure 3 is an isometrical drawing of all the flow-pipes as they are used and their sizes, and a reference to the plan (Fig. 2) shows plainly their relation to the building. The return-pipes, not shown, are almost identical with the flow-pipes so far as position is concerned, and in size they are equal.

It will be noticed a separate flow and return pipe is used for each floor, with the exception of the third, which is warmed by branches of the second-floor system. The

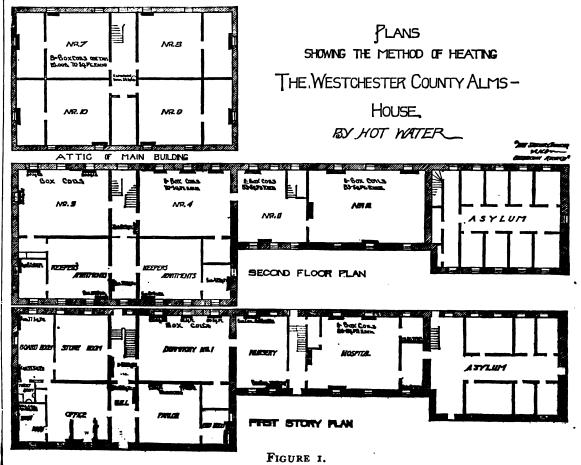

LONGITUDINAL SECTION F1G. 4.

basement contains about 450 square feet of surface, not considering the surface of the mains, and for this amount of surface, under the limited height of the basement, eight feet, the main or flow-pipe C starts 21/2 inches in diameter from the cross-drum at boilers and is carried up to the level of the second floor (a), within a closet, where an air-chamber and air-vent is attached, thence down again to the level of of the basement ceiling, close under which it runs. At the hall under the centre of the main building it reduces to 2 inches, and at the end it is 11/4 inches to the two last The up-leg of the loop and the pipe from the boiler is carefully covered, the object being to secure as great a difference of temperature between the legs as possible, or, in other words, to secure a greater loss of heat in the downleg, and consequently maintain a greater constant differ-

marked "Box-Coils," and the radiators "Rad." There is no advantage in the use of radiators or coils in one position over another, excepting appearance, the radiators being in the best-finished rooms, parlors, etc.

About 843 square feet of this surface is in the centre

building—first floor—and 540 square feet in the nursery and hospital. The pipe to the main part of the building (A) starts three inches in diameter and runs, as shown, under the basement ceiling. About the middle of the building, under the hallway, it reduces to two inches, thence runs to the end of that diameter. To any one particularly interested in the matter, all its branches can be traced in Fig. 3, with their sizes, etc. The pipe to the nursery and hospital part is $2\frac{1}{2}$ inches (A, right, Fig. 3), and is run as shown and marked, and requires no more explanation from us, as it may be traced on the drawing easily

The pipe B B in the drawing is for the second and third floors. It is 3 inches to the main building and 2½ inches to the centre building, and can also be traced, with the quantity of surface, at each branch.

In a few cases a pipe branches to two radiators, or coils, but usually a separate riser goes to each heater. The third floor, however, is always a continuation of the second story riser, though of a smaller size. and the door C is to remove ashes from the flue F. The dimensions of the walls, etc., on the ground plan are given. The elevations show the positions of the stop-valves and connections, and also the fire and draught doors. Each boiler in this case has a separate chimney.

The total heating-surface in the building is about 3,860 square feet, not including any of the running pipes. The boiler surface is about 700 square feet; the total area of the flow-pipes 29.1 square inches.

The expansion-tank is in the attic, and is connected with the headers of the boilers inside all valves by a 1-inch pipe. The pipe connects with the bottom and side of the tank, the side connection being to prevent hot vapor escaping within the water. Its capacity is 18 gallons, and it has a water-glass two feet long.

The extreme length of the buildings is 200 feet, and the ceilings of the first and second stories are 10 feet 9 inches and 10 feet 6 inches respectively, so that any one who is interested in the ratio of heating-surface to cubic arrangement of overflow-pipes. Ordinarily tanks have overflow-pipes open to the roof-gutters of building, with perhaps a running trap in them to prevent the ingress of cold air, or they are trapped and arranged like other fix-

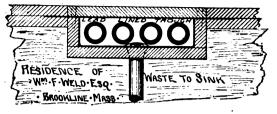

FIG. 8.

tures when they must go to a sink which connects with the sewer. The objection to these contrivances is the danger of syphoning or forcing the traps, or of their being evaporated or frozen. To overcome this the arrangement

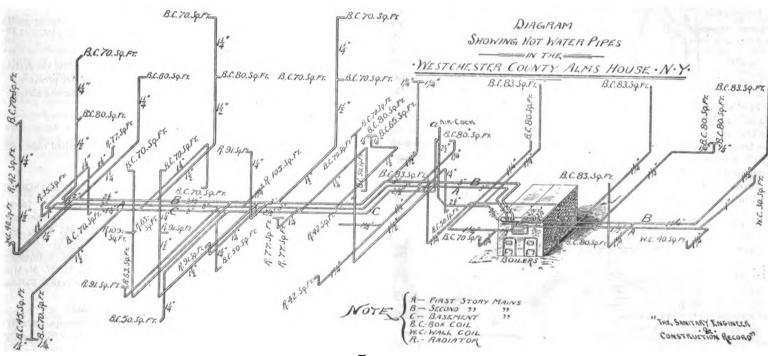

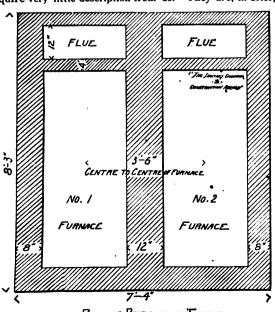

FIGURE 3.

BOILERS.

The boilers used are shown in Figs. 4, 5, 6, and 7, being respectively longitudinal section, front and side elevation, and ground plan.

They are Garth's twin hot-water boilers, and each contains 700 feet of extra heavy 1½-inch pipe. They are separately connected, as shown, by a 6-inch header, with 4-inch connections from each boiler.

The drawings show thoroughly what the boiler is, and require very little description from us. They are, in brief,

PLAN OF BRICKWORK FOR FURNACE.

box-coils, with the fire-box or furnace sides formed by flat coils. The heat of the fire, after leaving the furnace, is made to travel about the baffle-plates D D to the top, thence down the rear to the flue F. Doors are provided for cleaning at the sides A B, so as to reach all the tubes,

contents of rooms, etc., can approximate the latter by dividing the whole length into tenths and hundredths and using it for a scale.

The contractors were the Denny Brothers Company, of 34 Park Place, and their engineer who carried out the work was Mr. W. M. Mackay. The Heating Committee were Messrs. Miles Adams, Joseph B. See, and Moses W. Taylor.

SOME SKETCHES OF PLUMBING IN THE RESIDENCE OF WILLIAM F. WELD, ESQ., BROOKLINE, MASS.

No. III.

(Continued from Vel. XVI., page 743.)

In our last issue we treated of the water supply of this building. The tanks, Fig 7, there shown have a peculiar

shown in Fig. 7 was devised. It is simply a bottom connection taken from the tank and carried up outside of it to the water-line, thence down to the roof-gutter. A vent-pipe runs from the top of the overflow thus formed to prevent syphoning, should it become changed during the period of relieving the tank. Of course, with this arrangement, the trap can never be emptied while there is water in the tank, nor can cold air blow in to freeze the water.

Underneath the tank is a leaden safe, with drip-box for trap, etc. This box has a safe-waste from its bottom in the usual manner to a sink in the basement. All the running pipes of the house are treated in the same manner as shown in Fig. 8.

Figure 9 shows the details of a basin. The exposed pipes are all polished and plated brass put together with brass unions. Figure 9 shows a detail of the arrangement

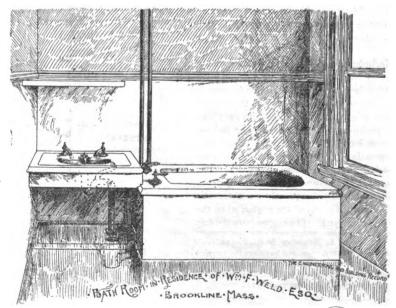

Figure 10. Digitized by GOOGLO

of the bath-tub and wash-bowl shown in the bath-room, Fig. 10. The bath-tub is ceramic ware, with a standing overflow. The bowl is an oval Pemberton bowl of large size, and the general appearance and arrangement of the room can be obtained from the sketch.

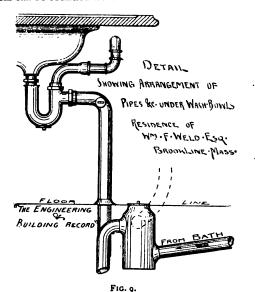

Figure II is a special arrangement of photographer's sink fitted on the top floor of the house. It is made of soapstone I½ inches thick, and has a drain-board at each end. The length over all is five feet. The length of the sink proper in the centre is three feet, by two feet wide, and its total height, including back, forty-two inches. It is set on an oak frame with heavy turned legs. The whole is set in a large leaden safe in the floor of the dark

for the purpose indicated. These two classes of steamelevators may be classified as:

(a) Intermittent. (b) Continuous.

The second general classification—viz., the hydraulic elevators—are those in which the static pressure or head of water is the source of energy, and is employed in a hydraulic engine. This static pressure may be due to either:

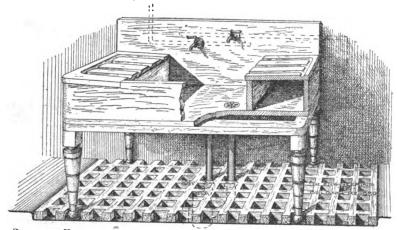

- (a) The natural head of the fluid, as in the case of many cities where the source of supply is higher than the point where the water is used.
- (b) The artificial head produced in a city water system by pumping from the source of supply to a higher reservoir, a stand-pipe, or, as in the case of the Holly Water System, by pumping directly in the pipes.
- (c) The artificial head produced locally in a building by the use of a steam-pump to give head to the water by pumping to an elevated tank, or else to deliver water into the hydraulic engine.

The third general classification—viz., the belt system of elevators—includes those in which the prime mover is of sufficient size to run an elevator in addition to its usual load, by means of shifting belts on fast and loose pulleys. This class of elevators is similar to the continuous steam-elevators above described, with the exceptions that there is no direct contrivances for the reducing of either pressure or speed, except the ordinary governor, when the elevator is not in operation, in the motor, and that the motor is used for other purposes beside the elevator.

For the sake of simplicity in our consideration of economy, we shall designate the respective classes as follows:

- A. Intermittent steam-elevators.
- B. Continuous steam-elevators.
- C. Hydraulic elevators actuated by the head of water derived from a city street-system.

 $\mathbf{D_1}.$ Hydraulic elevators actuated by the head of water

·SINK IN RESIDENCE OF WM·F·WELD·ESQ· BROOKLINE· MASS.

room, the safe being depressed about two inches below the actual floor-level. The legs of the sink, which rest in the safe, are set into leaden cups that are wiped on the bottom of the safe. A grating of hard wood is set into the safe so as to restore the level of the floor. The dotted lines show the trap beneath the safe.

(To be continued.)

THE MOST ECONOMICAL ELEVATOR.*

THE elevator systems at present employed in buildings are classified as follows: 1, Steam; 2, Hydraulic; 3, Belt.

The first class includes those in which a steam-engine is connected directly, by means of gearing or belting, with the drum upon which the cable operating the car is wound, the engine running, by means of a valve under the control of the operator, only when required to raise the car; and those in which a steam-engine is connected by belting running on fast and loose pulleys with the drum upon which the cable operating the car is wound, the engine running continuously, although the mean effective pressure, controlled by an ordinary governor, is reduced when the elevator it not in operation. Frequently an automatic contrivance for reducing the speed of the engine when the elevator is stopped is employed. The engine is used solely

*This article, by Mr. Edward E. Magovern, M E., first appeared in the Stevens Indicator of January, 1887, and has since been copied in English and continental exchanges. It embodies the result of tests made by the author on elevators supplied by the New York Scam Company, where he was engaged as assistant engineer.

derived from a local pressure induced by the pumping water to a roof-tank.

D₃. Hydraulic elevators actuated by the pressure of water pumped into a closed tank.

E. Belt elevators.

The economy of the system may be taken as follows:
1, Initial cost; 2, Cost of repairs; 3, Cost of attendance;
4, Cost of motive power, including lubricating, etc.

The following tables are based upon the results of a five years' experience with upwards of six hundred elevators of standard makes in the city of New York:

COST OF MOTIVE POWER .-- (Value 100.) Comparative Figure.E.... 12 D₁..... 18В.... 40A..... 6 maximum D₂ 100 INTEREST ON INITIAL COST.—(Value 331/3.) 1 minimum..... .E.... ... 15 B...... 45 D₁.... 90 6 maximum...... 100 COST OF REPAIRS.—(Value 271/2.) **F.**

COST	0 F	ATTENDANCE.—(Value 95.)	
ı minimum		E	to
2	· • • •	B	30
3		C	50
4		D ₁	75
5		A	85
6 maximum			100

Taking the cost of material and other items involved as at present time in the city of New York, the comparative figures for elevators doing the same work (i. e., of same lift, number of trips per day, and loads lifted), were obtained.

Manifestly, the elevator, the sum of whose resultant comparative figures is a minimum, is the most economical. The following table, therefore, gives the most economical elevator when the four facts above are considered:

THE MOST ECONOMICAL ELEVATOR.

Total maximum values, 33½ + 27½ + 95 + 100 = 255\$.

		Comparative 1 ik
ı minimum	 E	51.25
2		77.6
3		111.
4	D ₁	130.25
5		191.58
6 maximum		

Other items which frequently affect the decision are:

- 1. Want of necessary street-water pressure.
- 2. The requirement of more than one elevator.
- 3. Smoothness of motion.
- 4. Comparative safety.
- 5. Variations of load.
- 6. Peculiarities of situation, limited room, etc.

ROYAL METEOROLOGICAL SOCIETY.

THE opening meeting of this society for the present session was held on November 16 at the Institution of Civil Engineers, London, Mr. W. Ellis, F. R. A. S., President, in the chair.

Mr. C. E. de Bertodano, Dr. W. A. Bowen, Mr. F. J. Brodie, Dr. T. B. Hyslop, Prof. H. H. McMinnies, and Captain T. C. Newton were elected Fellows of the society.

The following papers were read:

(1) "The Use of the Spectroscope as a Hygrometer Simplified and Explained," by Mr. F.W. Cory, F. R. C.S., F. R. Met. Soc. The object of this paper is to suggest as simple a way as possible of using the spectroscope as a hygrometer in order to facilitate its introduction amongst observers as a standard meteorological instrument. The best form of hygrospectroscope as a recognized standard for the purpose of investigating and scrutinizing the changes of the three parts of the spectrum mentioned is that originally termed by Mr. Rand Capron "The Rainband Spectroscope." It ought to have a fixed slit, and, in addition, a milled wheel at the side for the easier adjustment of the focus. The author concludes by giving a set of hints to observers for taking weather observations with a pocket spectroscope.

(2) "Rainfall on and around Table Mountain, Capetown, Cape Colony," by Mr. J. G. Gamble, M. A., M. Inst. C. E., F. R. Met. Soc. The author calls attention to the great and, in some respects, peculiar differences that exist between the quantity of rain that is registered on and around Table Mountain. The most striking feature is the small fall on the signal hill, called "The Lion's Rump," which lies to the west of Capetown, between it and the Atlantic. The average annual fall there is only 15 inches, while the fall at the western foot is 21 inches, and in Capetown 27 inches. The signal hill is 1,143 feet above the sea. The fall at Platteklip, on the northern slope of Table Mountain, overlooking Capetown and 550 feet above the sea, is considerable-namely. 45 inches. The greatest fall is at Waai Kopje, about half a mile to the southward of the highest point of the mountain, at an elevation of 3,100 feet, or 450 feet below the top. Another station on Table Mountain further south, that is, to the leeward in the rainy season, and 2,500 feet above sea-level, has only 39 inches. The Eastern suburbs, Rondebosch, Newlands, and Wunberg, all have a comparatively abundant rainfall, 40 to 50 inches and upwards, the greater part of which falls in winter-time.

(3) "On the Cause of the Diurnal Oscillation of the Barometer," by Mr. R. Lawson, LL. D. The object of this paper is to show that the diurnal oscillation of the barometer is mainly due to the combination of the earth s rotation with its orbital motion.

BUILDERS' AND CONTRACTORS' ENGINEER-ING AND PLANT.

No. XXVI.

(Continued from Vol. XVI., page 677.)

MATERIAL LOCK USED IN THE PNEUMATIC CAISSONS AT THE FORTH BRIDGE.*

[Prepared for THE ENGINEERING AND BUILDING RECORD by F. W. Moir.]

THE illustrations in this week's issue represent two sectional elevations of the air-locks used for the removal of the material from the working chamber of the pneumatic caissons which were employed in the foundation of the cylindrical piers of the Forth Bridge. They were bolted to the head of a 3'6" shaft by the flange at their base, at such a level that they would always be above high-water mark at the lowest position of the caisson. The bucket is shown in the space, which becomes the intermediate chamber between the atmospheric and the higher pressure within the bell. This space is closed at either end by sliding doors D and D, which can be drawn back, or pushed forward by means of the hydraulic rams H and H, or the toothed racks and hand-wheels. To prevent the possibility of both the doors being opened at the same time, which would allow the high pressure air to escape, the following ingenious plan was adopted: the hydraulic valves controlling their opening and shutting, were made to lock one another. The way this was done will be understood by reference to the hand-wheels, D, D, Fig. 1. Each wheel, in its rotation, traverses a portion of the space, which is common to both; to allow

the main supply from the pumps. A whistle is provided on the side of the lock, which is made to sound by the lifted bucket as soon as it is at the right height. There is also an indicator to warn the engineman when to stop winding.

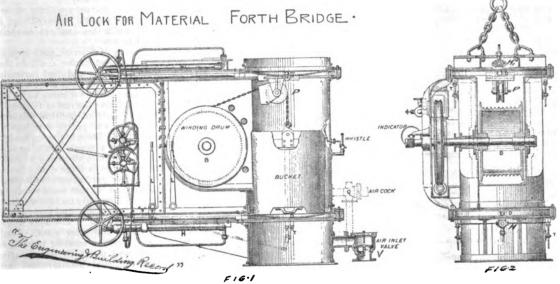

Air-locks, made as described, were used for the removal of both rock and boulder clay, with the greatest success, in the sinking of all the 70-feet cylinders at the Forth Bridge, without a single accident.

(TO BE CONTINUED.)

THE PERILS OF CAISSON SINKING.

THE following is an extract from a lecture on "Bridging the Firth of Forth" delivered at the Royal Institution by B. Baker and reported in Engineering. It is hardly necessary to say that Mr. Baker and Sir John Fowler are the engineers of the Forth Bridge. It forcibly recalls the disaster in the Hudson River tunnel some years since when so many men were drowned:

The process of sinking was as follows: The caisson being seated on the soft mud which, of course, practically filled the working chamber, air was blown in and a few men descended the shaft or tube of access to the working chamber in order to clear away the mud. This was done by diluting it to the necessary extent by water brought down a pipe under pressure, and by blowing it out in this liquid state through another pipe by means of the pressure of air in the chamber. It was found that the mud sealed the caisson so that a pressure of air considerably in excess of that of the water outside could be kept up, and it was unnecessary to vary the pressure according to the height of the tide. In working through this soft mud both intel-

of this, each wheel has a portion of its circumference removed; and that in such a position that it faces the opposite spindle when the door which it controls is closed, thereby allowing the other to turn, if necessary, to open its door. In Fig. 1, for example, the upper wheel D is in such a position that its door is closed, and it cannot turn, as the lower wheel has just been turned to open the lower door D.† The doors, the bearing faces of which are circular, are forced upwards by the air-pressure on their under side against a packing ring of rubber, and they drop one-quarter of an inch clear of this packing when the pressure is equalized.

To insure their quickly making an air-tight joint, after the pressure commences to increase, they are lifted by the bolts T T and the hand levers L. The upper door has swivelled to its under side the pulley block P, through which is passed the chain that heaves up the bucket to the drum B, revolving in an extension of the intermediate chamber. The drum-shaft passes through a stuffing-box, and has keved to it a worm-wheel W I, which is made to revolve by the worm W, driven direct on the crank-shaft of a pair of high-pressure engines. Q is the cock, by means of which the air in the intermediate chamber can either be reduced to the atmospheric pressure, or increased to that inside the bell. V is the air-inlet valve, for

* The tube riveting machine was illustrated and described in the issue of ()ctober 22, page 582.

+ Some four years ago this identical device was used in this city for a precisely semilar purpose, and by means of rods attached to pins on the wheels it controlled also the motion of a swinging pipe some d.starce away, whose position had to bear a fixed relatio opening and closing of the two cocks on whose stems the wheels were placed.-ED

ligence and courage were called for on the part of the men, and it is a pleasure and duty for me to say that the Italians and Belgians engaged on the work were never found wanting in those qualifications. There was always a chance of the caisson sinking suddenly or irregularly, and imprisoning some of the men, and indeed on one occasion a few men were buried up to their chins in the mud, and on another the caisson gave a sudden drop of seven feet. Happily, no serious accident happened, although I confess that I felt a little apprehensive myself, as I was familiar with the details of an accident with a similar caisson sunk in the bed of the Neva at St. Petersburg in 1876. In that case the wet mud rose rapidly in working chamber when the caisson sank suddenly eighteen inches one day, and of the twenty-eight men in the chamber nine remained imprisoned. Of these two managed to get their heads into the shaft of access, and were taken out alive after twenty eight hours, and the remaining seven were smothered in the mud. It was nearly a year before sinking was renewed. Again, in 1877, one of the air-locks suddenly gave way, and of the men then in the chamber three escapeo uninjured, nine were blown out by the rush of air, and, falling into the water and on craft, were mortally injured, whilst twenty were smothered in the caisson. It was thirteen months before the chamber was accessible, and then the vitiated atmosphere in the charnel-house below rendered it very difficult to work. Happily nouse below rendered it very difficult to work. Happily we had no such experience at the Forth."

M. WYATT PAPWORTH publishes very full "Notes on the Superintendents of English Buildings in the Middle Ages," supplemented by a paper by the late William Burges upon "Architectural Drawing in the Middle Ages." Both of these papers are well worth study of all those who are interested in the history of architecture, but our space will not allow us to give a satisfactory review of

REMARKABLE MEETING OF TUNNEL HEAD-INGS ON THE NEW CROTON AQUEDUCT.

SIR: I notice, with pleasure, the account you publish, on the 26th inst., of the accurate work of the engineers employed on the New Croton Aqueduct in the meeting of their tunnel headings. But such work is not altogether "unprecedented," as you style it, though highly creditable and quite close enough for all practical purposes.

A precedent of similar accuracy occurred in joining the headings of the Hoosac Tunnel east of the central shaft on December 12, 1872 As I had been responsible for the line. I was present on that occasion, and tested the alignment with the large transit used on the work. The lateral error, as I measured it, amounted to $\frac{1}{18}$ of an inch, or $\frac{1}{180}$ of a foot, while the vertical error was scarcely more in amount. The problem there had been to extend the tunnel line from the bottom of a shaft 1,000 feet in depth, encumbered by sixty-four separate floors and from a base encumbered by sixty-four separate floors and from a base of 23 feet, which was the greatest diameter of the shaft. The heading was thus extended for a distance of 1,563 feet to meet the eastern workings, which had penetrated the mountain a distance of 11,274 feet, or over two miles from the east portal. Although this long heading depended for its alignment on a long base outside, the shaft was nearly three times as deep as that on the Croton work; and the difficulties arising from smoke and fou in such and the difficulties arising from smoke and fog in such cases increase even faster than the length of headings.

During the progress of such work many refinements of detail are adopted by the engineers in charge, which in these two cases might have been simplified, perhaps, without leading to errors of practical consequence. But engineers in such positions feel the responsibility keenly, and are not to be blamed for seeking a degree of accuracy be-yond what may be practically important as a result.

In the meetings of the Mt. Cenis Tunnel an angular

variation occurred about ten times as large as at the Hoosac, amounting to no less than a "half a yard" at the point of meeting. Yet this was considered at the time entirely satisfactory, and was described as being "almost exact" in the point of satisfactory. act" in the printed accounts. Boston, Nov. 28, 1887.

EDWARD S. PHILBRICK.

[The account furnished to and printed by us indicated a very close, if not absolute, coincidence of the drill-holes, which certainly appeared to be much closer than anything we remembered in that line. In a subsequent letter from Mr. Wheeler he stated the error to have been five eighths of an inch.

We are sure our readers will pardon our unintentional misstatement, since it has drawn this interesting letter from Mr. Philbrick. We remember at the time reading of the very accurate work done at the Hoosac Tunnel, and are very glad to receive this account from the man who did it. It is stated that the error of alignment in the Musconetcong Tunnel, 5,000 feet in length, was only 300 of an inch, but we confess that we would like to have this confirmed.-ED.]

LONDON CORRESPONDENCE.

AT a subsequent meeting the Court of Common Council rescinded their folly in cutting down the expenses in connection with the office of City Architect, referred to in a previous issue. It was very properly urged by one of the members that "the primary consideration with the Corporation must be to secure the services of an officer not only competent to discharge with the greatest possible efficiency the duties of the allied professions of an architect and surveyor, but who shall also be possessed of such professional and social status as to justify the court in entrusting him with the large expenditure and numerous responsibilities which do and must always attach to the supervision and control of the city buildings, and the professional management (under the direction of the court) cf the corporation property in the city."

THE last general assembly of the "Verein für Gesundheitstechnik" was recently held in Vienna. The following were amongst the papers read: By Engineer Hartmann, on "Automatic Regulation of Heating Apparatus;" Engineer Rella, on "Sewerage;" Baurath Mihatsch, on the "Vienna Well-Water Supply," and Engineer Coglieviner on the "Lighting of School-rooms." The next meeting will be held in Dusseldorf.

THE Russian Government has just completed a loan of 25,000,000 roubles in Paris, to be devoted to the building of the Pevekok Canal in South Russia. The canal will allow of direct communication between the Don River and the Black and Azov seas. Although this is to be a strategic canal, yet it will have commercial value in developing the coal resources of the Don, and bringing it into strong competition with the English coal, which is generally used in Constantinople and the Black Sea regions.

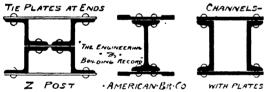

EXPERIMENTS UPON Z-IRON COLUMNS. BY C. L. STROBEL, M. AM. SOC. C. E.*

ABOUT a year ago the writer was called upon to prepare plans and specifications for the superstructure of the new bridge of the C., M. & St. P. R.R. over the Mississippi River at Kansas City. 1,545 lineal feet of this structure is a double-track iron trestle-work of forty-five feet average height. Important advantages could be secured for this part of the structure by adopting a new form of cross-section for the compression members, consisting of four Z-irons joined by lattice-bars in the middle. As Zirons were not at the time rolled in this country it was necessary to prepare rolls especially for the purpose. It was found that the rolling of the Z-iron presented no greater difficulty than the rolling of ordinary angle-iron. Notwithstanding the higher price charged because new rolls had to be prepared, the Z-iron was furnished by the mill at a much lower rate per pound than channel bars, for which they acted as a substitute, could have been bought for, and a considerable saving in cost of the structure was thereby effected.

The other advantages over compression members were thought to be the following: Economy of material in the lattice-bars. These are short and only one set is required, while two must be used in the other forms of construction. Economy of manufacture, only two rows of rivets being required, whereas four are needed in the other cross-section. Protected position of lattice-bars and consequent freedom from damage during transportation and handling. Possibility of effecting better connections with other members in the design of the structure.

A series of experiments were made to test its efficiency, and prove that the members were safe and consistent. Small columns were used in the experiments, but of the proportions, as near as possible, of those in the structure.

The Z-irons in the latter were 3x5x3 inches in size and 11 of an inch thick, while in the test columns 21/2 x3x21/2-inch Z-irons were used 15 of an inch thick. A table is given with summary of tests, and the expense of testing Nos. I to 6 was borne by the C. M. & St. P. Ry. Co., and Nos. 7 to 15 by this railroad company and Keystone Bridge Company jointly.

The tests were made in the hydraulic testing-machine of the Keystone Bridge Company, at their works in Pittsburg, under the supervision of S. C. Weiskopf, Mem. Am.

The columns were placed, horizontally in the testingmachine, with the lattice bars in a vertical plane, the ends of the column abutting squarely against the castings of the testing-machine without the interposition of shoes. To counteract the tendency of the column to sag from its own weight, an upward pull was caused to be exerted against the middle of the column equal to one-half its own weight. A'l of the columns failed in the direction in which they were theoretically weakest, and in a uniform manner by deflection.

A diagram was presented showing comparison of tests previously made on seven differect forms of columns.

In devising a formula which would satisfy the results of the tests on Z-iron columns for lengths beyond 90 radii, the equation of a straight line was found to answer as well as the equation of a curve, while having the advantage of simplicity. The following is the formula selected: Ultimate strength in pounds per square inch, 46,000 - 125-

for lengths exceeding 90 radii and 35,000 for lengths equal

It has been customary to allow 8,000 pounds per square inch in compression for bridge members of short length, which corresponds to a factor of safety of $\frac{35,000}{8,000} = 4.35$, when taken with reference to the ultimate strength. Although this factor is slightly less than is customary for tension members (for which the factor is about $\frac{46,000}{10,000} = 4.6$), it seems ample, when the fact is considered, that the ratio of elastic limit to allowed strain is the true factor of safety in

the ordinary use of a structure, and that this ratio will be greater for compression members than for tension members on a basis of the above factor. For long compression members which fail by flexure as a whole, the ultimate strength is very little removed from the elastic limit, so that the factor of safety with reference to the elastic limit becomes greater as the length of the member increases. Dividing the constants in the above formula by 4.35 we obtain the following: 10,600 — 28.5 $\frac{1}{2}$. To provide ad-

ditional security for long members, the writer considers it desirable to substitute 30 for 28.5 as the second constant, whence is obtained the following: Allowed strain in pounds per square inch for square ended Z-iron columns

10,600 – 30 $\frac{1}{r}$ for lengths exceeding 90 radii and 8,000 for

lengths equal or less than 90 radii.

THE NEW ENGLAND WATER-WORKS ASSOCIATION.

The regular quarterly meeting of this association will be held at Young's Hotel, Boston, on Wednesday, December 14, 1887.

The rooms will be open for members' use at 11 o'clock. The Executive Committee will meet at 11:30 o'clock and there will be a general business meeting at 12 o'clock, with lunch at I o'clock. At 2:30 o'clock Prof. Drown, of the Massachusetts Institute of Technology, will read a paper entitled, "The Odor and Color of Surface Waters." Members are invited to be prepared to discuss this topic and to suggest for discussion at future meetings any others which they may deem of interest to the association.

Members are requested to notify R. C. P. Coggeshall, Secretary, New Bedford, of their intention to be present. Members of water boards are also invited to be present.

ENGINEERS' CLUB OF PHILADELPHIA.

THE regular meeting of the club was held November 19, President T. M. Cleemann in the chair, Howard Murphy, Secretary, and 35 members and one visitor present. The secretary presented, for Mr. W. H. Nauman, a paper upon the "Calorimetric Investigation of the Performance of a Compound Engine," embodying considerable tabular data. Mr. J. E. Codman presented a description, illustrated by specimens, etc., of "Cement Tests," showing the effect the shapes of specimens had upon the results. There was some discussion by Mr. A. Marichal. The secretary presented, for Mr. C. H. Haswell, a specimen of cement. The discussion of Mr. C. G. Darrach's paper upon "Boiler Specifications" was continued by Messrs. J. T. Boyd, O. C. Wolf, P. Roberts, Jr., A. Marichal, and the secretary. The secretary also presented a communication thereon from Mr. G. R. Hen-

THE Genic Civile, of November 12, contains a very fully illustrated article descriptive of the Emery testing-machine at the Watertown Arsenal.

THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS.

Our correspondent reports the holding of a very successful and interesting meeting this week in Philadelphia, about 175 members in attendance. A report of the meeting will appear in our next issue.

MINNEAPOLIS, MINN.—At the meeting of the Engineers' Club of Minnesota, held in Minneapolis last week, the proposed constitution was discussed in detail, and Messrs. Sturtevant, Cappella, Hunter, Turner, and Redfield were appointed a committee to revise the constitution.

A STORAGE-BATTERY OF IDEAS OR BRAIN ACCUMULATOR.

(BILL NYE, in the New York World.)

(BILL NVE, in the New York World.)

MR. EDISON has now perfected, or announces that he is on the road to the perfection of. a machine which I may be pardoned for calling a storage think-tank. This will enable a brainy man to sit at home and, with an electric motor and a perfected phonograph, he can think into a tin dipper or funnel, which will, by the aid of electricity and a new style of foil, record and preserve his ideas on a sheet of soft metal, so that when any one says to him, "A penny for your thoughts," he can go to his valise and give him a piece of his mind. Thus, the man who has such wild and beautiful thoughts in the night and never can hold on to them long enough to turn on the gas and get his writing materials can set this thing by the head of his bed, and, when the poetic thought comes to him in the stilly night, he can think into a hopper, and the genius of Franklin and Edison together will enable him to fire it Franklin and Edison together will enable him to fire it back at his friends in the morning while they eat their pancakes and glucose syrup from Vermont, or he can mail the sheet of tin-foil to absent friends, who may put it into their phonographs and utilize it. In this way the world may harness the gray matter of its best men, and it will be no uncommon thing to see a dozen brainy men tied up in a row in the back office of an intellectual syndicate, dropping pregnant thoughts in a little electric coffee-mill for a

ping pregnant thoughts in a little electric coffee-mill for a couple of hours a day, after which they can put on their coats, draw their pay and go home.

All this will reduce the quantity of exercise, both mental and physical. Two men with good brains could do the thinking for sixty millions of people and feel perfectly fresh and rested the next day. Take four men, we will say, two to do the day thinking and two more to go on deck at night, and see how much time the rest of the world would have to go fishing. A pair of political thinkers could furnish one hundred millions of people with logical conclusions enough to last them through the campaign and put an unbiased opinion into a man's house for less than he now pays for gas. Itst before election you could and put an unbiased opinion into a man's house for less than he now pays for gas. Just before election you could go into your private office, throw in a large dose of campaign whiskey, light a campaign cigar, fasten your buttonhole to the wall by an elastic band, so that there would be a gentle pull on it, and turn the electricity on your mechanical thought-supply. It would save time and money, and the result would be the same that it is now. This would only be the beginning, of course, and after a while every qualified voter who did not feel like exerting himself so much could give his name and proxy to the Salaried Thinker employed by the National Think-Retort and Supply-Works. We talk a great deal about the union of Church and State, but that is not so dangerous, after all, as the mixture of politics and independent thought. Will the coming voter be an automatic, legless, hairless mollusk the coming voter be an automatic, legless, hairless mollusk with an abnormal ear constantly glued to the tube of a big tank full of symmetrical ideas furnished by a National Bureau of Brains in the employ of the party in power?

PERSONAL.

T. W. Fratt has been appointed Chief Engineer for e Wisconsin Central Railroad Company at Milwaukee, Wis.

JAMES S. TROWBRIDGE, of the architectural firm of Buddemeyer, Plympton & Trowbridge, has died of

CHARLES S. STEPHENS, late of the Louis Waefelaer Company, New York City, has been appointed Manager of the Continental Tube Works (Limited), of Pittsburg,

COMMANDER ALEXANDER H. McCormick, Lieut.-Commander George A. Convers, and P. A. Engineer George W. Baird have been appointed a board to consider and report upon the best type of engine and the amount of power required to run all the machinery at the Washington Ordnance Foundry.

^{*} Abstract of paper read at American Society of Civil Engineers, November 16, 1887.

CONTRACTING NEWS DEPARTMENT:

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITIONS.

GALVESTON, TEX.—Plans, specifications, and estimates are invited, and will be received up to the 14th of December, for the building of Sealy Hospital. For particulars apply to Dr. W. H. Baldinger, Secretary of Committee on Building, Sealy Hospital, Galveston, Tex.

ST. PAUL, MINN.—Architect D. W. Millard, of this city, has been awarded first place in the competition for plans for the new Y. M. C. A. bu lding to be built at the corner of Tenth and Minnesota Streets. Wirth & Haas were awarded second place.

CORSICANA, TFX.—Plans are wanted for the State Orphan Asylum to be built here. No date specified. Address M. Drum, Chairman Building Committee.

For works for which proposals are requested see also the "Proposal Column," pages 1-3-8.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE ENGINEERING & BUILDING RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and rel able news for our "Contract ng Intelligence." Information of importance sent to us exclusively, and not eisewhere published, will be liberally paid for.

WATER. SEWERAGE, ETC.

BUFFALO, N. Y.—The Committee on Sewers has considered new bids for completing the Babcock Street sewer job. Contractor Frank Winter failed in business and has not finished the sewer. His bondsmen refuse to do the work. Three bids have been received for completing the work: W. A. Green, \$45.359; D. W. McConnell, \$52,080; Thomas Dark & Son, \$50,000. City Engineer Krause claims that the bids are excessive, and asked permission to readvertise for bids in Buffalo and other cities. The matter was laid over.

The committee considered three proposals

The committee considered three proposals for ventilating the trunk sewer, submitted several months ago by Mr. Thomas Dark, Sr., by the McAndrews Sanitary Company, and by Benson & Stilwell. Mr. Dark's plan involves an expenditure of about \$15,000, that of the McAndrews Company about \$35,000, and that of Benson & Stilwell about \$10,000. The estimated cost of natural gas is \$600 per year. The committee resolved to report in favor of Mr. Dark's plan.

FOSTORIA, O.—A few days ago the vote on water-works occurred, the result being yes, 526: no, 7. The works are to be constructed by an Eastern firm, the city reserving the privilege of buying them at the end of five years. Work on the construction will be begun at the earliest possible moment and ten miles of mains will be put down.

Framingham, Mass.—The question of a proper and efficient system of sewerage continues to occupy the attention of the selectmen, who were appointed as a special committee on drainage at a meeting held last August. S. C. Herald, an engineer of this town, has submitted his report as directed by the committee, of the estimated cost in detail of such a system as is desired, and, according to it, the system complete will cost \$140.059.15. The report has been approved by the special committee, and the matter is now in the hands of the selectmen. Important developments are expected soon.

DEVIL'S LAKE, DAK.—The City Council resolved to call an election for the purpose of voting on the question of bonding the city in the sum of \$12,000 to sink an artesian well and maintain a system of water-supply, also to build a city hall.

DE LEON SPRINGS, FI.A.—Water-works will be established here as soon as E. F. Barney can fix details.

HENDERSON, N. C.—Water-works are contemplated here MOORHEAD, MINN.—A contract has been let for a 5-inch hole, 1,500 feet deep, artesian well, for \$7,500.

FAULKTON, DAK.—Contract for artesian well let to Swan & Co. Work to commence December 1.

ALLEGHENY, PA.—The contract for the erection of a water-tank has been awarded to Messrs. Sailor, Briggs & Lyons at \$2,283.50.

HENDERSONVILLE, N. C.—January 2 is the day when the water-works question will be decided by the people at the polls.

BONHAM. Tex.—At a meeting of the Council held November 23 the issuance of \$50,000 worth of bonds was ordered for waterworks. The water will be obtained by a system of artesian gang-wells, and work on the wells will begin at once.

ST. Andrews, New Brunswick.—Our correspondent says: "The officials of this city desire to communicate with water-works contractors concerning a project to establish water works here. The supply is to come from a lake about four miles distant and eighty feet above the level of the town. Address T. McGrath, 120 Broadway, New York City, Room 36, Seventh Floor."

COLUMBUS, O.—The water-works trustees have decided to throw out the bids for the construction of a 15.000,000 gallon pumping engine and have ordered the superintendent to readvertise for bids up to December 8, as the bids received November I do not fill the requirements.

SALISBURY, MD.—There has been considerable controversy over the franchise granted to J. A. Cloud & Co., of Philadelphia, by the town authorities to place water-works here. Some of the lawyers of the town dispute the commissioners' authority to grant such a franchise, as the town charter, it is claimed, does not invest them with the authority. Several local capitalists were considering the question of erecting the works themselves, with the idea that the franchise granted to Cloud & Co. would be abrogated. A letter, however, has just been received from Mr. J. A. Cloud by the town commissioners, in which he says that it is his firm's purpose to build the works and has already taken preliminary steps in that direction. He adds that he will hold the town of Salisbury responsible if works are erected by other parties before the terms of his franchise expire. The matter is now in the hands of the trustees.

MANKATO, MINN.—Our correspondent writes: "This city has about completed a reservoir of 1,000.000 gallons capacity on the hill near the city with an elevation of 230 feet above the business part of the city. The same is connected with the water-mains by 16-inch pipe. Water to be forced into reservoir from flowing well at the foot of hill. We have also commenced a system of sewerage and will expend about \$15,000 this season. Sewer ranging from brick sewer 36x54-inch to 10-inch pipe sewer, together with 6-inch house connections."

HYDE PARK, MASS.--Our correspondent informs us that nothing has been done towards establishing water-works here.

Grand Rapids, Mich.—Our correspondent writes: "It is impossible to state at this time what we will do in the way of improvement of our water works, as the whole thing depends upon the result of the vote on the proposition to raise money for this work. If it fails to carry nothing can be done. December 6 is set as the time for the election."

ROCHESTER, PA.—In answer to an inquiry concerning water-works construction here our correspondent writes: "We have obtained charter, made contract with borough councils to supply sixty fire hydrants for term of thirty years at price or sum of \$2,750 per annum, are now making contracts with manufacturers and other consumers, and expect to let contract for construction of our works early in the year 1888. Rising main will be twelve or sixteen inches. Reservoir elevation 350 feet above level of Ohio River, from which water will be pumped by two compound pumpingengines (vertical) of a capacity of about 1,500,000 gallons each per day. Will lay six or eight miles pipe, mostly from 6 to 12 inch."

MONTGOMERY, ALA.—In all probability there will be considerable sewerage work here shortly. A project to that end is now being agitated.

ORONO, ME.—A meeting was held in Orono recently and preliminary steps-were taken for the organization of a water company, under the charter granted by the last Legislature. A committee was chosen to make estimates of the cost and consider the feasibility of putting in the works next year.

KANSAS CITY, Mo.—The National Water-Works Company will construct two water-towers, one at Quindars and the other on the bluffs; to be built of double iron sheeting, and to cost \$25,000.

NORFOLK, VA.—This city is at present discussing two projects, one as to a system of filtering their present supply of water, and another of erecting a new water-works plant. Propositions have been received from several concerns, suggesting ideas and asking for authority to proceed with their schemes. Nothing definite has been done as yet, though it is probable that a new plant will be established, with a supply from driven wells. The Mayor of the city favors this last project.

WOODSTOCK, VT.—The construction of the reservoir and laying the pipes of the Woodstock Aqueduct Company has just been completed. The reservoir is about two miles west of and is 260 feet higher than the village. The pipes are all cast iron, the larger main being eight inches, and the reservoir contains 2,500,000 gallons. The company was incorporated in 1880 and the capital is \$30,000.

OMAHA, 'NEB.—The Omaha Water-Works Company has just contracted for one of the new Gaskill pumps, manufactured at Lockport, N. Y. This pump is an identical pattern of the one just placed at Buffalo, and has a capacity of 14,000,000 gallons per day, with all the modern improvements and a guaranteed duty of 100,000,000 foot pounds. It weights 600 tons, and its transportation here will require a freight train of twenty cars or more. The foundations for and the erection of the pump wi'l cost over\$100,000, and the contract provides for its placement at the new plant at Florence and in readiness for operation, by the 1st day of June. 1888. It will be the second largest pump in the United States, and is only another evidence of the magnitude and thoroughness of the plans for the new waterworks plant. When finished it will be one of the most effective and complete systems in the world.

JERSEY CITY.—John F. Ward, of this city, has contracted to lay 1,250 feet of 12-inch cast-iron water-pipe across Burrad Inlet, at Vancouver, British Columbia, for \$12,000. He has also contracted to lay over 6,000 feet of 12-inch cast-iron water-pipe across the Guyas River, at Guayaquil, Ecuador, for \$43,000.

ATHOL, MASS.—Concerning a report that water-works were to be established here, our correspondent says: "Our town has an established water-works, all complete, and has had for the past 10 or 12 years."

GALION,O.—Our correspondent writes about water-works matters here: "Our city is supplied with water by a system similar to the Holly, with stand-pipe attached; source of supply, a driven well, 20 feet diameter, with cluster of driven wells to augment it; owned by a local company; projected and nearly completed by "Starr," from near Philadelphia or New Jersey, do not recollect which; water-works effectual during this summer's severe drought."

Mt. Vernon, N. Y.—Concerning a rumor that water-works were to be erected here, our correspondent writes as follows: "The Mt. Vernon Water Company has a system of water-works in operation; I know of no other in contemplation."

PINE BLUFF, ARK.—Our correspondent writes concerning water-works matters at this place: "The contract for water-works in this city has been awarded to the St. Louis Water, Light, and Power Company, The works are now in process of erection and will probably be completed by the 1st of March next."

KALVESTA, KAN. — Our correspondent writes: "Our well is on the town site, but the distance to the farthest point where we intend to force the water is a little over one mile. We intend to elevate the tank at the well so as to give sufficient pressure to force the water to any point in town. We will use a three-way anti-freezing pump and a 12-foot Star windmill."

KNOXVILLE, IA.—Our correspondent writes: "We are putting in a stand-pipe 120 feet high by 12 feet in circumference; laying 12, 8, and 4 inch mains, and a pumping engine of 750,—000 gallons capacity."

BRISTOL, TENN. — Our correspondent writes: "Our corporation has employed an engineer and he is now engaged surveying several routes to different springs or water-courses and will soon make his report. I think some action will be taken with a view of establishing water-works for supplying Bristol, Tenn., and Goodson, Va., with water."

JERSEYVILLE, ILL.—Our correspondent writes: "We are having an artesian well bored for the purpose of supplying our city with water. The intention is to bore to the depth of at least 2,000 fect, unless a stream of water large enough is found to guarantee a good supply before reaching that depth."

PITTSFIELD, ILL. — Our correspondent writes in answer to an inquiry about waterworks matters here: "We have got the watertower built and are now waiting for the tank, which according to contract should be here and in position. It will be 105 feet high when complete. Mains have just been laid in front of all business houses. Water is supplied from a large well, and bids are being now received for digging an artesian well from 1,500 to 2,000 feet deep. Pavements of flagging of Cleveland stone are being laid in front of all business houses. All work is being done under superintendence of the Town Trustees."

JEFFERSONVILLE, KY.—It is reported that a contract has been made with Messrs. S. R. Bullock & Co., of New York City, to erect water-works here. Work will begin at once.

WALTHAM, MASS.— The Sewerage and Drainage Commission will prepare plans and estimates for a sewerage system.

St. Paul, Minn.—The Board of Public Works has rejected all bids for building sewer on Walnut Street as too high.

TIOGA, PA.—The Tioga Water Co. has been incorporated. Capital stock, \$15,000. T. A. Wickham, E. G. Schufflin, and others, incorporators.

BURNET, TEX.—Our correspondent writes: "The City Council of Burnet, on petition of the citizens, has ordered the sinking of an artesian well and appointed a committee to solicit bids and make contracts. City wants a well flowing a continuous stream at least six inches in diameter, and, if possible, to rise 25 or 30 feet above the surface, durably piped with heavy iron piping. We do not know the depth, but think that the water can be obtained at 500 feet, but the city wants the water if we have to go 1,000 feet or more."

WARREN, MASS.—Our correspondent answers an inquiry about water-works here as follows: "There are no new arrangements for water-works, except one by a number of individuals who have built an iron reservoir on a hill, the supply for which is pumped from the river by water-power from one of the factories."

ALLENTOWN, PA.—Concerning water-works matters here our correspondent writes: "There has been about 2,700 feet of 20-inch pipe laid, which was furnished by R. D. Wood & Co., of Philadelphia. The foundation for the pumps is laid, which are built by the Knowles Manufacturing Co. The foundation for stand-pipe is laid. It is to be erected by Tippett & Wood, of Phillipsburg, N. J. The pumps were to be finished by November 1 and staud-pipe by December 1, but neither have made their appearance."

CLARKSBURG, W. VA.—John W. Hill, of Cincinnati, O., is consulting engineer for water-works to be erected here.

GALVESTON. TEX.-Our correspondent 'The recent amendment to the city charter empowers the city to construct waterworks and sewerage, allowing \$450,000 to be raised by bonds for that purpose. Recent periments by boring shows that water can Recent ex. secured at from 800 to 900 feet deep. Two wells, bored by the hydraulic-jet process, chiefly through sand yields over 100,000 gallons each every twenty four hours. A number of these wells are expected to give in the aggregate all the water required. A Board of Water-Supply Commissioners has been appointed and Colonel J. D. Cook, C. E., of Toledo, O., has been secured as consulting and supervising engineer. He has just visited this city and will shortly report the most ad-visable plan to adopt. The amount allowed by charter (\$450,000) will about secure a water-supply, and the sewerage question must remain in abeyance till the reconvention of the next Legislature."

PARKSIDE, N. V .- A system of sewerage will be established here next spring.

HILLSBORO, ILL.-W. R. Coates, C. E. of Kalamazoo, has begun a survey of the city preparatory to drafting plans and specifications for a system of water-works, costing \$25,000.

ITHACA, MICH.--This place will probably establish a system of water-works before long.

The question is now being agitated.

ALTON, Mo.—A special election will be held here shortly to determine the question of water-works. A committee has been appointed to arrange for the election.

BROOKLYN, N. Y .- The question of a better water-supply for this city is again being agitated, and the Ramapo Water Company has renewed its offer made several months ago. The communication from the Ramapo Water Company was presented to the Board of Aldermen, who referred it to the Water and Drainage Committee.

BLOCK ISLAND, R. I .- A water-works system will be established here soon.

SANTA MONICA, CAL-It is reported that Senator Jones, now here, will build water-works for this resort. Water will be brought from San Vicente Springs, over three miles, to an immense reservoir. The works will cost \$40,000.

NEW ORLEANS, LA .- New machinery is to be added to the water-works here.

STURGIS, MICH.—A system of water-works is wanted here.

SEDALIA, Mo.- An ordinance has been passed providing for 13,000 feet of water-mains and twenty-five hydrants.

LAFAYETTE, IND.-W. R. Coats Kalamazoo, Mich., has finished plans for the improvement of the water-works system here.

GADSDEN, ALA.-A sewerage system is anticipated here.

CENTRALIA, ILL.—The committee appointed at the last meeting of the City Council to interest themselves in securing a suitable sys tem of water-works for this city met recently and authorized the Mayor to request T. C. Morgan, of Chicago, a civil engineer, to visit Centralia for the purpose of examining the water supply and mapping out a system of works suitable for this city.

TAUNTON, MASS.—It is reported that the State Board of Health has advised the city of Brockton to dispose of its sewage by filtration.

SACRAMENTO, CAL.-A company has been formed to take 100,000 inches of water from Dry Creek, Amador County, for irrigation in Sacramento and Fresno Counties.

WINDSOR LOCKS, CONN.—At a recent meeting of the Windsor Locks Water Company plans were discussed and estimates given for the purpose of supplying the town with water. Edward D. Coogan and Henry C. Douglass were appointed a committee to examine such plans, etc., as were made and to procure estimates for necessary work in connection with the project. The question will be determined at a meeting to be held at an early date.

PROVIDENCE, R. I.--Our correspondent PROVIDE.SCE, K. 1.—Our correspondent writes: "We are to build a new pumping station, No. 3, and lay additional force mains. There have been no steps taken as yer; shall commence in the spring. Such material as will be needed will be purchased and detained this winter.

READING, Pa .- This place is discussing the question of increasing the water-supply

TORONTO, CAN. -It is probable that there will be considerable sewer-work here before

CHICAGO, ILL.--Answering a question in regard to the Oak Park Water, Gas and Electric Co. our correspondent says: "This plant was started some four or five years ago by Mr. James W. Scoville, of Oak Point, who placed in the earth, in the shape of a pond, a reservoir covering over two acres of ground. Following this he erected a stand-pipe, 105 feet high, put in 100 horse-power engine of two boilers, and dug one artesian well some 2.000 feet deep of 5-inch capacity. In Sep-tember last Scoville was bought out by the Cicero Water, Gas and Electric Co., who paid \$65,000 for the well, reservoir, engine house, real estate, etc., connected therewith. The latter company has now 32,000 to 33,000 feet of water-pipe laid, and it is the intention of the company to put in ten miles more pipe during next season. The same company also during next season. The same company also expects to supply the villages of Oak Park, Ridgeland, Austin, and Moreland with water. One or two more artesian wells will be sunk this winter."

BRIDGES.

BORDENTOWN, N. J.—The Trenton Iron Co., of Trenton, has been awarded the contract for the construction of a bridge here.

St. Louis, Mo .- The King Iron Bridge and Manufacturing Co., of Cleveland, O., has been awarded the contract for the construction of a bridge on Grand Avenue. Cost, \$225,000.

DUBUQUE, IOWA .- Mr. Spalding, of this city, has received the contract to erect a highway bridge for the county at Zollicoffer's, He will take down two spans of the D. & E. D Company's bridge across Seventh Street slough, which weigh 60,000 pounds, and slough, which weigh 60,000 pounds, and transport the material to Zollicoffer's in wagons. The area beneath the two spans to be removed he will fill to the grade of the railroad track.

BLACK RIVER FALLS, WIS .- The county of Jackson and the town of Albion have let a contract with Ward & Keepers, of Clinton, Iowa, for the erection of an iron bridge across Perry's Creek about three miles south of this city. The work is to be completed in three months.

Oshkosh, Wis.—This city will expend \$20,000 for a new iron bridge across the Fox River.

FINDLAY, O .--The Board of Commissioners of Hancock County are considering a proposition to build a road and foot-bridge across the Blanchard, and will doubtless order the construction of the same at their December meeting. The cost of the bridge will not be less than \$60,000.

GRAND FORKS, DAK. T.—Resolutions were passed at a recent meeting of the Council to petition the next Congress for leave to construct two iron bridges across the Red River at this place, and also to bond the city in \$50,000 to build the same.

PINEVILLE, KY, -Our correspondent writes; Two iron bridges are to be built across the umberland River at this place. The bridges Cumberland River at this place. are to be built by the county. Also new brick and stone court house and jail to cost \$20,000, and a large new hotel. All to be let soon and work to be pushed as rapidly as possible this winter. We will be glad to answer all inquiries. Address the Bridge or Court-House Commissioners, or James S. Ray, President Pineville Land and Iron Co., Pineville, Ky."

SEYMOUR, IND. -Our correspondent writes concerning bridge matters here: "We have built one bridge this year and have one on hand at present, at a cost of about \$18,000; will build one next year.

TER, CAL. — Our correspondent The Board of Supervisors of this HOLLISTER, county has received bids for constructing a bridge across the San Benito River. The contract has been given the Pacific Bridge Co., of San Francisco, for \$18,500.

MECHANICVILLE, N. Y. - The \$20 000 worth of stock issued to build the new across the Hudson River at this place has all been sold, and as soon as the plans are com-pleted bids will be advertised for. President Smith and Treasurer Moore are pushing matters to start it at once.

MEMPHIS, TENN .- The negotiations between the Ford syndicate, which possesses a charter for a bridge over the Mississippi River at this point, and the railroads touching here. broken off. The latter declined to buy the Ford franchise on account of the restrictions of charter, and because they did not consider it worth the price demanded—\$500,000. The Ford people now announce that they will build the bridge with the aid of the Union Bridge Company of New York, and promise to begin work within a month.

OMAHA. NEB.—It is reported that a bridge is to be erected across the Missouri for the benefit of the Chicago, Milwaukee and St. Paul Road. General Superintendent Clark. of the above road, can give information.

TALCOTTVILLE, CONN. - A new iron bridge to be be built at once over the Hockanum River in Talcottville.

BLACK RIVER FALLS, WIS .- Town of Albion and County of Jackson have contracted with Ward & Keepers, Clinton, Iowa, for construction of iron bridge.

FORT WAYNE, IND .- The County Comissioners have advertised for new proposals for building an iron bridge over St. Mary's River.

MINNEAPOLIS, MINN.—A new bridge is to be erected over the Manitoba and St Louis tracks at Lyndale Avenue in this city, at a cost of \$40,000. Alderman Cloutier can give information.

ST. PAUL, MINN.—Bonds for \$50,000 for building the Colorado Street bridge have been authorized

The City Council has rejected all bids for hot-water heating the foundling home and annex, and ordered a readvertisement for bids.

SPARTA, N. C .- Four bridges are to be erected by the Commissioners of Allegheny County.

GAS AND ELECTRIC-LIGHTING.

MANCELONA, MICH .- The electric light is to be put in here shortly.

WASHINGTON, KAN. — The Washington Electric-Light Co. has been granted the ex-- The Washington clusive privilege of operating electric lights here for 21 years.

BRYAN, O .- Another gas well has been shot with 96 quarts of nitro-glycerine, increasing the flow of gas to 2,000,000 feet per second. The result of this operation will settle the question of laying pipe mains into the city limits, and eventually the use of gas both as fuel and light will be adopted. Meanwhile, well No. 1, sunk one year ago, continues to flow oil at intervals of three or four days."

LAWRENCE, MASS .- By authority of the Gas Commissioners the local gas company will purchase a plant for electric lighting.

GAINESVILLE, FLA.-W. J. Winegar, of Palatka, has purchased a site to build gas-works, and will begin work at once.

CRETE, NEB.—The incandes ent system electric lights recently put in operation in this city is said to have proved a costly failure

HENDERSON, N. C.-Gas-works will probably be established here. Address the Mayor.

GOLDSBORO, N. C .- An electric-light plant is to be erected here. H. A. DeKay is in charge of the scheme.

CARROLLTON, KY.—Gas-works are to be established here. H. M. Winslow can give information.

GLENS FALLS, N. Y.—The Electric Light Committee of South Glens Falls has signed the contract with the Thomson-Houston Com pany, and the lights will soon be put in.

LEICESTER, MASS .-- It is reported that a stock company has been formed here to introduce electric-lights into several of the many

MANCHESTER, VA.—The Manchester Fuel, Power and Lighting Co. will erect a plant here.

ASHEVILLE, N. C .- Additional machinery will be placed at the local electric-light works to enlarge their incandescent plant.

EAST PORTLAND, ORE.-H. Hoyme can give information concerning an electric-light plant to be established here

OXFORD, N. C.—An electric-light plant is wanted here. The Mayor can give informa-

DUNDEE, MICH .- This village has granted to the Dundee Fuel Gas Company for thirty years the exclusive privilege of laying pipes for conducting oil, gas, or mineral water, and the company agrees to have laid 5,000 feet of pipe within five years.

CARLINVILLE, ILL.—This place is to have an electric light plant, with a capacity of filty arc lights of 2,000 candle power.

GRAND LEDGE. MICH .- An electric-light plant here is assured.

LIVERMORE, CAL.—The Town Council has granted to Thomas Varney, President of the Bank of Livermore, and others, a franchise for the erection of an electric-light plant, and it is stated by the projectors that work will be begun within a few weeks.

OAKLAND, ME .- The subject of lighting the streets of this place by electricity is at present engaging the attention of the citizens.

POMONA, CAL.—This place is to be lighted with gas soon.

HASTINGS. MINN. - Thomson-Houston Electric-Light Co., of St. Paul, has franchise to put in plant here.

GRAND FORKS, DAK .- A Griggs is putting in a \$75,000 gas plant.

FORT WAYNE, IND.—Our correspondent writes: The Jenney Electric Light and Power Company has purchased what is known as the "Feeder Canal" for \$67,000, and will utilize its water power to operate the city plant.

CHICAGO, ILL.-A letter received from the Vice-President of the Cicero Water. Gas, and Electric Company, recently organized in this city, for the purpose of furnishing light, water, etc., for the villages of Oak Park, Ridgeland, Austin, and Moreland, says: "We have not, as yet, decided whether we will use electricity or gas for lighting purposes. We will determine that during the winter.'

STREET WORK AND PAVING.

ST. PAUL, MINN., Board of Public Works as awarded contract for grading Third, has awarded contract for grading Third, Fourth, and Canal Streets to J. D. Moran at \$25,000.

RAILROADS, CANALS, ETC.

GREENVILLE, TEX.-Charters have been granted two companies to build street railways here.

RALEIGII, N. C.-P. Lineham & Co., of this city, have been awarded the contract for the construction of a line of railway for the Durham and Northern Railway Company.

MORRISTOWN, TENN.-A company will be organized soon to build a street railroad. O. C. King can give information.

THE Minneapolis, Sault Ste. Marie and Atlantic Railroad will construct a line from Rhinelander to Ashton.

KANSAS CITY, Mo.—The City Council has granted a franchise to the Holmes Street Cable Car Company to construct a cable railway in this city, over ten miles in length. It will be necessary in constructing this road to build a necessary in constructing this road to build a viaduct of iron trestle nearly three-fourths of a mile long and 75 feet high. A large iron bridge will also be erected across Rock Creek. Work is expected to begin shortly.

FORT SCOTT, KAN .- The Missouri Pacific Railroad will erect an immense dining building here.

ASHLAND, KAN .- A company has been formed here to construct and operate a street railway.

MILWAUKEE. WIS. - Synopsis of bids for lighting streets in the suburbs, not lighted by gas, opened November 19 by the Board of Public Works. The Wheeler Reflector Company offered to put up lamps at \$16.26 per light on the old poles and \$17,60 on new poles. The Northwestern Globe Gas-Light Company would furnish oil lamps at \$15.30, reflectors at \$16.80 on old poles and \$20 where new poles are used. The Badger Illuminating Company offered to erect and maintain electric lights at \$190 per year where overhead wires could be used; \$215 where underground wires are necessary and the number of lamps less than 25. For from 25 to 50 lamps, underground wires, they wanted \$2.05 per lamp. Bernhard Fritche put in a bid for oil lamps in the Eleventh Ward at \$12 per light, lighting streets in the suburbs, not lighted by lamp. Bernhard Fritche put in a bid for oil lamps in the Eleventh Ward at \$12 per light, and in the Fourteenth at \$13 per lamp. Wm. Klein offered to light the Ninth Ward with oil at \$14 90 per light. Fred. Luening bid \$12.13 per lamp for oil in the Eighth Ward and John Widerski \$14 for oil in the Fourteenth Ward. The Sun Vapor Light and Stove Company offered to light all of the wards for \$17.20 per lamp, and also put in a separate bid for each ward ranging from \$20 to \$22. The bids will be sent to the council, which will award the contract. The contract is for three years from the 1st of October, is for three years from the 1st of October,

NEW YORK CITY.—The Department of Charities and Correction was to have opened bids November 29 for a steam pump, boilerhouse, etc., three pavilions, etc., steam boiler and steam apparatus, for the farm at Central Islip and for Randall's Island, but the opening has been postponed and the bids will be readvertised.

CHICAGO, ILL.—Synopsis of bids for build-CHICAGO, ILL.—Synopsis of bids for building a viaduct at the west approach to Jackson Street, to span the C., B. & Q., the P., F. W. & C., and the C. & A. Railroads: Pittsburg Bridge Co., \$114.800; Detroit Bridge and Iron Works, \$95,500; Keystone Bridge Co., Pittsburg, \$94,610; W. G. Coolidge & Co., Chicago, \$94,555; King Iron and Bridge Co., Buffalo, \$92,404; and for part of work only, Chicago Forge and Bridge Co., \$40,725; A. Gottlieb & Co., Chicago, \$89,840. The contract was awarded to last-named bidders.

TORONTO, CANADA.—Synopsis of bids for water-meters opened November 14 by James B. Boustead, Chairman Water Committee:

(Crown) National Meter Co. (Crown).	(Worthingto:)	(Crown pattern)	ton pattern), Toronto	H. R. Worthington \$1,594.00 \$1,240.00 \$560.00 \$293.00 \$637.00 \$1,980 \$166.00	BIDDENS.	
13 00 13.50	13.95	13.65	12.80	\$1,594.00	%-inch. 1∞0.	
20.00	20.00	21.60	22.40	\$1,240.00	36-inch. 3-inch. 3-inch. 4-inch. Deposit. 100. 25. 6. 6. 6. Deposit.	
30.∞	24.75	:	29.60	\$₺60.∞	1-inch. 25.	
•	24.75 40.75 80.30	<u>:</u> :	48.8₀	\$293.00	a-inch. 6.	
75.00 150.00	80.30	: : :	97 82	\$ 637.∞	3-inch. 6.	
300	295	<u>:</u>	276	\$1.980	4-inch. 6.	•
57.50 159.37	150.00		145.00	\$:66.00	Deposit.	1

In connection with the above meters the committee submit the following report of the Superintendent:

TORONTO, November 16, 1887. "To the Chairman and Members of the Com-mittee on Water Works:

GENTLEMEN-In reference to the tenders for the water-meters required by the Department, I would respectfully recommend as fol-

"For the %-inch and 3/-inch meters what is known as the 'Crown meter,' and for the I-inch, 2-inch, and 3-inch what is known as the 'Worthington meter'; these meters have both been thoroughly tested by the Depart-

ment and found very satisfactory.
"I would also recommend theacceptance of their respective makers—namely, for the Crown meter, the National Meter Company, of New York, and for the Worthington meter, H. R. Worthington, of New York, for the reason that these meters have given better satisfaction than those made by the Canadian manufacturers of the same pattern, which is accounted for by the fact that the most deliaccounted for by the fact that the most deli-cate working parts are made of a composition, the secret of which the Canadian manufac-turers are not in possession of. This applies more especially to those of the Worthington pattern. I don't think any meters of the Crown pattern have been made in the city, so that it would be in the light of an experiment with this meter, and as the working parts of the Crown meter are also made of a composition, I think it would be advisable to procure these meters from the patentees and original makers.

"All of which is respectfully submitted.

"WILLIAM HAMILTON,

"Superintendent."

Your committee, therefore, begs to recom-nend that, in accordance with the report of the Superintendent, tender No. 5 be accepted for 100 meters, of \(\frac{1}{2}\)-inch size, at \(\frac{1}{2}\)1.50, and 50 meters, \(\frac{1}{2}\)-inch size, at \(\frac{1}{2}\)2 50, both sizes of the Crown pattern. Also that tender No. 1 be accepted for 25 one-inch meters at \$860; 6 2-inch meters at \$293, and 6 3-inch meters at \$637, of the Worthington pattern.
Report adopted in Council.

St. Louis, Mo.—Synopsis of bids for 100 fire-plugs, 100-valve box-raisers, and 100 stop-valve boxes, opened November 22 by D. P. Rowland, Commissioner W. W. Supplies:

JACKSONVILLE, ILL.—The City Council has decided to advertise for proposals to furnish the city with not less than 1,000,000 gallons of water per 24 hours.

HARRISBURG, PA.-Contractor Oglesby, of this city, is erecting water-works at the Soldiers' and Church Orphans' Home at Loysville, Perry County.

GUYANDOTTE, W. VA.—This place is to be supplied with water by the Huatington Water-Works Co.

TEMPLE, TEXAS. - Major Burkett, of Houston, Texas, has made a proposition to erect water-works here.

MACON, GA.—The Jeter-Boardman Water and Gas Association has been organized to build water, electric light and gas-works at different places. W. W. Jeter is president.

SHERMAN, TEX.—Urb n Broughton, of Chicago, Ill., representing the Shone Pneumatic Co., is figuring on the cost of a sewerage system for this place. About \$60,000 has been appropriated. For details address the Mayor.

OXFORD, N. C.—A water-works plant is to be established here. Address the Mayor.

HILLSBORO, ILL.-A water-works committee has been appointed and an engineer will be employed to prepare plans and superintend the construction of the proposed works.

SALEM, DAK. - A system of water-works is to be established here.

PIPESTONE, MINN .- The National Iron and Brass Works, of Dubuque, Iowa, have been awarded the contract for the construction of a system of water-works here.

DOVER, N. H., November 30, decided in favor of building new water-works. The con-struction of the water-works will begin in the

BONHAM, TEX.-The City Council has determined upon a complete system of water-works and the officials have been inspecting the works of other cities. Action will probably be taken shortly.

PHŒNIX, ARIZ.—The City Council has granted a franchise for water-works to J. J. Gardiner.

HYDE PARK, ILL. - The Kensington Electric Light Co. has applied for a charter to establish and operate a plant here.

IONIA, MICH.—This place is advertising for bids for lighting the streets by electricity.

SAN ANGELO, TEX.—T. O. Richards, of Chicago, is to establish an electric-light plant here at once.

FAYETTEVILLE, N. C .- F. C. De Richards has closed a contract to erect water-works here.

WACO, TEX.—The King Iron Bridge and Manufacturing Co., of Cleveland, O., has been awarded the contract for the construction of a bridge over the Brazos River. Cost, \$49,500.

BENTON, KAN -W. G. Harvey, of Atchison, will build three bridges here.

CINCINNATI, O .- The County Commissionbu ld a bridge over the Miami River. Fred Paine is in charge.

PORT TOWNSEND, N. Y.—Synopsis of bids for masonry, iron, and carpenter work of second floor Custom-House, opened November 30 by the Supervising Architect of the Treasury Department:

Bidders.	Stone facing.	Brick facing.
James B. Halliday and William	\$21,50C	\$14.300
J. I., Middlebrook	20,350	20,350
John O' Johnor	27.300	26,500
Bart ett & Wilkes	30.620	24,175

* Brick and stone as per drawings.

LEAVENWORTH, KAN.—Synopsis of bids for approaches to Court-House, earth, stone and brick-work, drain-piping, Belgian block paving, macadam roadway and wood fence, opened November 30 by the Supervising Architect of the Treasury Department:

Owen Patterson, \$5,155. McCarthy & Baldwin, \$5,310. A. French, \$2,980 William T. Yoakum, \$2,690.

NEW YORK CITY.-Synopsis of bids for building a new crib-bulkhead at the foot of West 158th Street, and for dredging thereat, opened December I by the Commissioner of the Department of Docks. The engineer's estimate gives about 9,000 cubic yards dredging and about 98,600 cubic feet, more or less, of crib work. The bidders were: Joseph Walsh, New York, \$19,000; John Monks, \$21,675; J. W. Fl A. Gillies, \$14,360. W. Flaherty, \$18,500; Duncan

Building Intelligence.

We solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

A CIVIL ENGINEER PRESIDENT OF FRANCE.

ALL of our readers have noticed, and doubtless some of them with more or less of professional pride, that the recently elected President of the French Republic, M. Marie Francois Sadi-Carnot, is, like M. de Freycinet, a civil engineer. As the *World* says: "One of the foremost civil engineers of France, his training as an engineer and a political economist fits him in a quite particular manner for the high office to which he has been elected.'

It is a fact worth noting that of the so-called "learned professions," law, medicine, and divinity, to which, in these days of multiplied technical schools, that of engineering must certainly be added, the latter is chiefly, if not solely, the one which qualifies its practitioner for high executive position.

An engineer—and in its widest sense this includes the architect as well—is one trained to subjugate the forces of nature to the service of man, and this usually by planning and directing the organized effort of many men. In large enterprises, like a great railway, the conflict with nature assumes vast proportions, and thousands of men and millions of money are employed, while an interoceanic canal becomes an affair of national importance. As an illustration, M. Sadi-Carnot's professional staff, while Minister of Public Works, included 72 chief engineers, 270 ordinary engineers, and 1,500 assistant engineers. It is a little singular that, in this country especially, which is perhaps indebted more to its engineers than any other set of men for its marvelous development, the engineer has received such scanty reward and almost no political preferment.

While the satirical paraphrase of a sentence in an address of Lincoln's, that this is "a government of the lawyers, by the lawyers, and for the lawyers," is hardly true, it is nevertheless a fact, that, perhaps from the facile combination of law and politics, the legal profession occupies a disproportionately large number of the official positions in this country, and however well fitted a lawyer may be for a legislative or judicial position, it is time we thought seriously of utilizing for executive positions some of the high executive ability fostered and manifested in the profession of the engineer.

It seems proper, then, that the members of the profession, when opportunity may offer, should encourage a recognition of this policy, not as engineers merely, but as wise and patriotic citizens trained to accomplish the best results by the best methods through the best men.

UNDERGROUND FROM FOURTH AVE-NUE TO THE CITY HALL.

THE New York Times is authority for the statement that plans have been prepared, the consent of the property owners secured, and the necessary capital subscribed for a four-track underground road on the line of Elm Street from Fourth Avenue to the City Hall, the proposed widening and extension of Elm Street to be taken advantage of for the construction of the proposed subway. It further intimates that W. K. Vanderbilt, Cornelius Vanderbilt, Chauncey M. Depew, Orlando B. Potter, John Jacob Astor, William W. Astor, the Rhinelanders, the Lorillards, and many other representative people have embarked in the enterprise. If so they but follow the policy of the late Cornelius Vanderbilt and revive a project on which he had nearly embarked. It may not be generally known that in 1873 he had proceeded so far with a scheme to extend the railway tracks on Fourth Avenue under-ground from the Grand Central Depot to the City Hall that the contracts were placed and all ready for signature, when at the last moment, perhaps suspecting the troublous times that soon followed, he concluded to go no further.

Had his project been then carried out it might have postponed or prevented the construction of the elevated roads, and New York might by this time have had a complete system of underground transportation.

We are glad to welcome the new enterprise, and believe Mr. Vanderbilt's successors will vindicate the wisdom of his original plan, more daring and difficult then than now. It will in all probability give an effectual quietus to the Arcade and Underground schemes for Broadway, though they may perhaps find more feasible routes west of that thoroughfare. It will not, however, afford much relief to the travel on the west side, where, as we have long advised, a substantial viaduct through blocks should be constructed on property bought and paid for. While the Elm Street tunnel will be a great boon to dwellers in Harlem and the new district, the west side viaduct is needed for the Hudson River side of the city and to build up that beautifui residential portion at and beyond Manhattanville.

HOSPITAL ORGANIZATION AND MAN-AGEMENT.

THE report of the Dublin Hospitals Commission, recently published, with its appendices, forms a folio volume of over 350 pages, which is interesting reading, not only to those immediately concerned, but also as an historical document of permanent value.

Dublin has more hospitals in proportion to its population than any city in the United Kingdom, and the result is that most of them are insufficiently supported, and that the expenses of management are disproportionately large.

Dr. Corley's expression that "we are over-hospitalled, but not over-bedded," seems to hit the mark.

The questions dealt with by the Commission relate largely to local details, as bearing on the general subject of the Parliamentary grant of funds for the Dublin hospitals and the methods of its distribution. It advises consolidation into five or six hospitals, and that the conditions upon which the Parliamentary grant is distributed shall be such as to promote this consolida-These conditions afford some useful hints about hospital organization in large cities, and we therefore give them in full.

"First—The hospital shall contain not less than eighty beds, and after five years' participation in the grant, not less than one hundred, in daily occupation throughout the year.

"Second-The hospital shall be open for clinical instruction, and shall have not less than fifty pay-

ing students on its books each year.

Third—The hospital shall be open to persons of all creeds, without any distinction, and clergymen of, all denominations shall be admitted to see patients requiring their ministrations at any hour of the day or night.

Digitized by GOGle

"Fourth-The staff of the hospital shall be appointed without distinction of creed or the place of education, or reference to the candidate's connection with any particular university or medical corporation or hospital, and without payment of any sum of money; and the principle of promotion from the junior to the senior appointments shall be recognized as far as may be deemed compatible with the interests of the institution. No member of the staff shall hold a similar appointment in any other hospital.

"Fifth—The junior appointments, such as resident surgeons and physicians, shall be filled up by examination, for which any duly qualified candidate may present himself.

"Sixth—The hospital shall employ as nurses only such persons as have gone through a duly recognized probationary training."

We commend these rules to the consideration of those who may be on the boards of management of hospitals.

There will be a main under each sidewalk, as no serviceline will be allowed to cross the roadway. Only main lines can be carried across the roadways (at a depth of one metre), and man or hand holes at each end of a crossing will give access to the wires under the street.

All switches, cut-offs, etc., shall be outside of the street

All plans to be deposited in triplicate with the city and kept up to date.

Repairs of sidewalk and road-beds to made by the city and paid for by the company at the following rates: paved road-bed, \$0.09 per square foot; macadam bed, \$0.055 per square foot; asphalt bed, \$0.335 per square foot; wood pavement, \$0.428 per square foot; bitumen sidewalk, \$0.145 per square foot; granite sidewalk, \$0.09 per square foot; price of curbing, straight or circular, \$0.200 per piece. The company to maintain temporary repairs of road-bed over their trenches (for not over fifteen days after refilling) till accepted by the city. All repairs of sewer-work, water-pipe, etc., to be paid by the company according to the bill of work kept by the city in-

buildings, etc., to be determined by experts at their market value at time of sale.

value at time of sale.

Everything to be put back into its original shape on completion of the eighteen years, if the charter is not renewed or bought up.

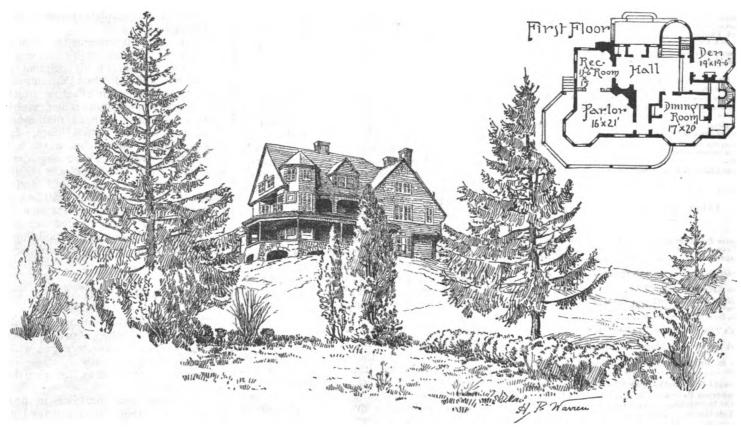

Company to give bond to the amount of at least \$5,000 at the rate of \$2,000 per kilometre of conduit.

Not over ten per cent. of foreign labor to be employed. The company to hold the city free from all claim for damages. Damages done to conduit by city contractors to be repaired by contractors, but the city not held liable for it.

OUR SPECIAL ILLUSTRATION.

CLUB HOUSE FOR THE DOWN TOWN ASSOCIATION OF NEW YORK.—C. C. HAIGHT, ARCHITECT.

This building is situated at 60 and 62 Pine Street, extending through to Cedar Street. It is used as a clubhouse for the Down Town Association of New York. Material used on the Pine Street front, the lower part is of Belleville, N. J., sandstone, upper part of buff brick, with buff terra-cotta trimmings. Cedar Street front is of similar character, with red brick and terra-cotta. The entrance-hall, office, and lavatories have marble mosaic floors. hall, office, and lavatories have marble mosaic floors. Principal rooms finished in dark oak, with large open fire-places and oak chimney-pieces. The main staircase is of

RESIDENCE OF CLARENCE WHITMAN. NEW BRIGHTON, STATEN ISLAND.-LAMB & RICH, ARCHITECTS.

THE FORM OF LICENSE FOR ELECTRIC-LIGHT COMPANIES IN PARIS.

THE city of Paris, France, received a revenue from the gas company monopoly in 1886 of some \$3.500,000, of which \$40,000 was for right of way (some 900 miles), some \$2,500,000 being the city's share of the profits, and nearly \$1,000,000 in form of a tax of eleven cents per 1,000 cubic feet of gas consumed, which takes the place of the regular tax on all coal entering the city.

In making out a form of charter or license for electric light and power companies, the city officials had to take into account the diminution in revenue the city is likely to get from the gas companies. From Le Genie Civil we learn the following are the principal features of the pro-

Wires to be laid in the sewers where there is space enough and when they will not interfere with other public services, but the city reserves the right to order them out if the space is needed for other purposes, or there are any

When not laid in sewers the wires shall be laid under the sidewalks in suitable metal or masonry conduits. spector. The license to last for eighteen years, but city reserves right to buy up the right and plant after seven years. The license only covers the right of way actually taken up by the wires, the city reserving the right to license other companies for the same district and same streets. The maximum charge made by the company for use of its light or power is fixed at \$0.012 per carcel hour, or \$0.12 per horse-power hour.

The company is bound to furnish electricity to any one on the lines of its wires who may desire it on the terms of on the lines of its wires who may desire it on the terms of ts policies. The company to pay the city an annual tax of \$20 per kilometre of conduit and five per cent. of the amount of its policies. If the electric stations are outside the city limits this amount will be six per cent., the addition representing the city tax on coal. The company to pay all costs for verifying the power of light, income, etc. The license to be annulled if work is sublet to outside section if more is not begun within six morths of data of The license to be annulled it work is subjet to outside parties; if work is not begun within six months of date of license; if the supply of electricity is partially or totally cut off; if taxes are not paid up in time.

The basis of buying out by the city after seven years will be the average net revenues for the five preceding years, which will be paid the company in annuities for the rect of the term of license in the company in annuities for the

rest of the term of license; or the corresponding capital at six per cent. paid at once. Price for plant, tools, main s,

iron, with marble treads. There is an elevator from ground-

iron, with marble treads. There is an elevator from ground-floor to upper dining room floor.

The first floor contains the entrance-hall, in which is the office, and adjoining on the east side are the reception-room, telephone-closet, and lavatory. On the north side a spacious opening leads to restaurant, 40x48, passing on the way by staircase at the right, and coat-room and elevator at the left hand.

On the second floor above the entrance-hall and reception-room is the reading-room 32x43, connected with the smoking-room, which is over restaurant, by the staircase-

Two dining-rooms occupy the larger part of the third floor, of similar dimensions to rooms on floor below, and on the floor above are found a number of private dining-rooms. The kitchen is on the top floor. The cost was about \$150,000.

The architect was Mr. Charles C. Haight, of New

OUR VIGNETTE ILLUSTRATION.

RESIDENCE OF CLARENCE WHITMAN, NEW BRIGHTON, STATEN ISLAND.

THE subject of our vignette illustration is the residence of Mr. Clarence Whitman, New Brighton, Staten Island. The building is of wood, shingled. The architects were Lamb & Rich, of New York.

HENRY IRVING'S "SAFETY THEATRE."

WE reproduce a plan and section of this interesting building from the London Architect, to which paper the blocks were loaned by the Daily Telegraph. The former says:

"It will be observed that the designers have adopted the theory of Wagner in avoiding many ranges of boxes and galleries. The building may be said to have but one story, and the lowest-priced seats will be found in the rear of the pit instead of at a lofty height, but it is said that the most distant seat will command an extensive view of the stage. How far a theatre so disposed would pay the lessee is a question not easily solved. There can be no doubt if safety depended upon facilities of exit it is to be found in the new theatre, and people would probably pay a higher price for having some hours' enjoyment without any apprehension of danger."

THE NEW YORK ARCHITECTURAL LEAGUE.

On Monday evening last the league dinner and subsequent meeting was an unusually successful and enjoyable affair, about sixty members being present. Mr. J. P. Riley gave an entertaining word picture under the title, "A Day in Florence." Mr. E. K. Rossiter read an interesting paper on "An Old Colonial House in Connecticut"-the Demming Homestead at Litchfield-the architect of which was Mr. Spratt, who had been a Hessian soldier in the Revolution. His description of the methods of construction in vogue at that day excited considerable interest. The record of what an architect's fee was at that time was the charge for a day's service of 7s. 6d. about \$1.87 %. The frame of the house was hewn timber. with oak planking three inches thick. The hardware came from England, and the author made a point of the fact that the workmen were more than usually intelligent in their craft in carrying out the architect's designs by reason of their seven years' apprenticeship in the old country.

A subscription was taken up from those present at the dinner for the medal, for which \$170 was secured at the time. The jury to select a design for a medal from the drawings that have been invited is to consist of R. M. Hunt, C. F. McKim, Russell Sturgis, as non-members of the league; W. C. Hazlett, J. Du Fais, and C. I. Berg, members.

The Hanging Committee selected for the approaching exhibition of drawings are: J. Du Fais, Bruce Price, F. A. Wright, E. P. Treadwell, and J. B. Robinson. The names of the officers to be voted on for the ensuing year were also posted. From the announcements made by the Executive Committee, there is every indication that the approaching exhibition will be the most successful one yet held.

EXAMINATION IN ARCHITECTURE—ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE following extracts from the examination papers of the Royal Institute of British Architects may be of interest to students of architecture in the United States as showing the line of study followed in England.

THE EXAMINATION.

All gentlemen engaged in the study or practice of architecture, before presenting themselves for election as associates, are required to have passed an examination according to a standard fixed by the Council of the Royal Institute of British Architects; and in places where a scheme of examination, approved by the said council, has been formulated, the examination is conducted by means of sealed papers under the charge of members of the Institute, who act as moderators, superintend the oral examinations, and report thereon. In all cases the candidates' answers, written and graphic, and the reports of the moderators, are transmitted to the council of the Institute for decision. The examination is conducted in accordance with the following principal regulations and programme:

PROGRAMME OF WORK TO BE DONE IN PRESENCE OF MODERATORS.

History of Architecture (to be illustrated by sketches).

The leading characteristics and history of the principal styles of architecture.

The special characteristics and history of any one of the following periods which the candidate may select, namely:

- (a) Greek or Roman architecture;
- (b) Architecture of Italy or France from the Tenth century to the end of the Fourteenth century;
- (c) Architecture of Italy or France from the beginning of the Fifteenth century to the present time;
- (d) Architecture of England for some one century between the years 1100 and 1700 A. D.

Moldings, features, and ornaments (to be illustrated by sketches).

As characteristic of architectural styles generally.

As characteristic of the special style which may have been se ceted by the candidate.

Sanitary science, strength of materials, shoring, etc.— Drainage, sanitary arrangements and requirements.

The application of formulas for calculating the strength

Shoring and underpinning, and dealing with ruinous and dangerous structures.

Plans, section and elevation of a building.—The detailed arrangement of a building for a given purpose, as for example, a parsonage for a town parish, a residence for a surgeon or other practitioner, a set of offices, to be filled in upon a skeleton plan (a scale of 1/8 of an inch to a foot).

A plan of one upper floor and of the roof, with details

of the principal constructional arrangements.

The section and elevation (to a scale of 1/8 of an inch to a foot), with constructional and artistic details to a larger scale.

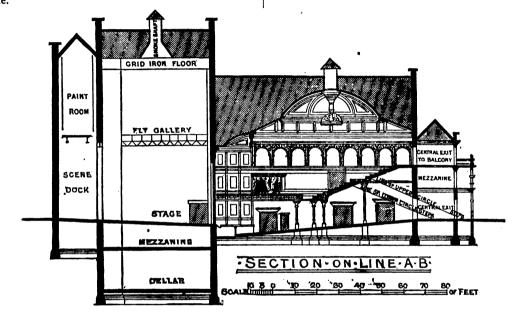

100; plans. section, and elevation, 200; materials, construction, etc., 100; specifications and methods of estimating, 75; professional practice, 25.

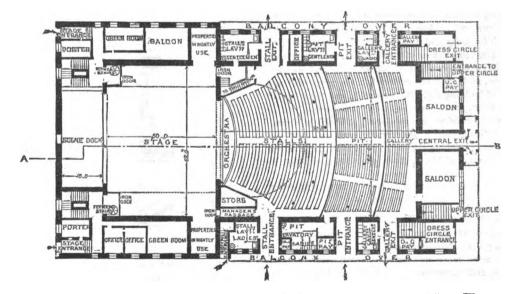

A candidate in order to pass must obtain at least half the number of marks (namely 350), though this proportion need not necessarly extend to each of the several divisions.

ADVICE TO CANDIDATES DESIROUS OF ENTERING FOR THE EXAMINATION.

As a general foundation for the knowledge necessary to pass the examination in all its branches, a careful study of Gwilt's *Incyclopædia*, which should be in the possession of every architectural student, will be found of great service; the student will there find almost all the subjects required dealt with concisely, but at sufficient length to form an admirable introduction to the specific study of each.

For the history of architecture the earlier chapters of Gwilt's, Fergusson's History, Gailhabaud's Monuments, Batissier's L'Art Monumental, Ramée's Histoire Générale,

GROUND PLAN OF HENRY IRVING'S "SAFETY THEATRE." == :

Materials, construction, etc.—The nature and properties of building materials, including their decay, preservation, quality, and strength, and their application to building

The principles of construction as applied in practice to foundations, walls, arches, vaults, roofs, floors, and partitions.

Specifications and Methods of Estimating Cost.—A specification of the work necessary in one or more trades for the building designed by the candidate.

Manner of specifying for other trades and methods of estimating the cost of any building.

Professional Practice.—The general conditions usually appended to a specification and contract.

The number of marks allowed by the examiners will be 700, thus subdivided:

History of architecture, illustrated by sketches, 100; moldings, features, and ornaments, illustrated by sketches, 100; sanitary science, strength of materials, shoring, etc.,

etc., etc., should be supplemented by the biographical works of Milizia and Quatremère de Quincy, while, for those who have the opportunity, the lives of the architects treated of by Vasari will afford much instruction. The special text-books relating to each style will also afford detailed information to which that contained in the preceding works can only be considered as introductory; the more important of these text-books are mentioned in the succeeding paragraphs, the observations in which apply equally to this head of history.

While each candidate will be required to show a thorough acquaintance, graphic and historical, with the style and period selected by him, he will also be expected to show a knowledge of the history of other styles.

For moldings, features, and ornaments, in the special style selected by the candidate, acquaintance should be obtained by drawing, measuring, and sletching an actual building, aided by careful study of the most accessible of

the standard works, a thorough acquaintance with which should be acquired.

For Greek Architecture.—The study of Stuart and Revett's Antiquities of Athens, Wilkins's Magna Græcia, the Society of Dilettanti's Antiquities of Ionia and of Attica, Mr. Penrose's Athenian Architecture, and Cockerell's Ægina, is indispensable.

For Roman Architecture.—A knowledge can be acquired from Taylor & Cresy's Antiquities of Rome, Adam's Spalatro, Wood & Dawkins's Palmyra and Balbec; from Palladio, Canina, etc. The orders are well shown in Mauch, Normand, Nicholson, Chambers, and Gwilt; and classic ornament is shown in Vulliamy, Tatham, etc.

For Mediæval Architecture.—Reference should be made to Sharpe's Parallels, Pugin's Normandy, Paley's Moldings, Brandon's Analysis, Colling's Details and (rnaments; to Rickman, Bloxam, and to Viollet-Le-Duc's Dictionnaire.

For Renaissance Architecture.—Of the history and of the architects of this period every candidate will be expected to have a knowledge, which can be acquired from Letarouilly's Rome, and from Pallaido; from Granjean and Famin's Toscane, Percier & Fontaine's Rome, and Cicognara's Venezia; and the careful perusal of Sir William Chambers's Treatise on the Decorative part of Civil Architecture should not on any account be omitted.

The candidate must distinctly understand that he will be required to show a reasonable acquaintance with styles and periods other than that selected by him.

For Plan, Elevation, Section, etc., the experience acquired in office practice may, with advantage, be supplemented by attendance at the Architectural School of the Royal Academy, the Classes of Design and Construction of the Architectural Association, and the classes of local societies.

For Materials and Construction the knowledge gained in office work and in the inspection of buildings in progress should prove useful. The three volumes of Notes on Building Construction will be found of great value-in fact, indispensable; and the Pocket-Books of Hurst & Young should be carefully studied: Tredgold & Newland on Carpentry, Rankine's Manuals of Applied Mechanics and Civil Engineering, Stoney on Strains, Mr. Tarn's Science of Building, Stock's Shoring and Underpinning, and other technical works, may be studied with advantage. Applied mathematics and geometry may form part of the examination, and readiness of calculation and acquaintance with formulas and their application will be appreciated. The construction of floors and roofs; the methods of calculating the strength of timber, cast and wrought iron beams, and of other materials; the properties and qualities of building materials generally, and the modes of applying them, must be studied under this head.

For Sanitary Science a careful study of Parkes's Manual of Hygiene is desirable; and for the practical details of drainage and plumbing the works of Mr. B. Latham, and Bailey-Denton, and Mr. Hellyer, should be consulted.

TEST OF A WROUGHT-IRON DOUBLE-TRACK FLOOR-BEAM.*

BY ALFRED P. BOLLER, MEM. AM. SOC. C. E.

"TESTING to rupture actual bridge members is always a matter of great scientific interest, and while the record is quite extensive in eye-bars, posts, or small parts, the great cost, time, and inconvenience of handling heavy girders has prevented experiment in that direction. In fact, the writer is unaware of any experiment upon compound riveted beams on a large scale, as actually used, until the experiment recorded below was made under his supervision.

The beam was an exact duplicate of those in use on a bridge, about which more or less controversy had arisen as to their practical safety, and the test was made under, as near as possible, actual conditions of attachment and loading. The annexed drawing shows the form and proportion of the beam and connection with the posts, together with the position of the track-stringers. The actual static loads to which the beam could be subjected by the heaviest engines in use on the road, with weight of floor, is 40,000 pounds at each stringer bearing, the strains computed therefrom being as follows:

Flange strains at m, 3,800 pounds per square inch.

At a, 5,700 pounds per square inch;

At b, 6,400 pounds per square inch.

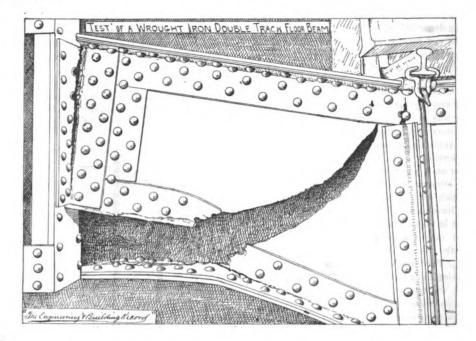

Shear strains in web, between a and b, 2,600 pounds per square inch.

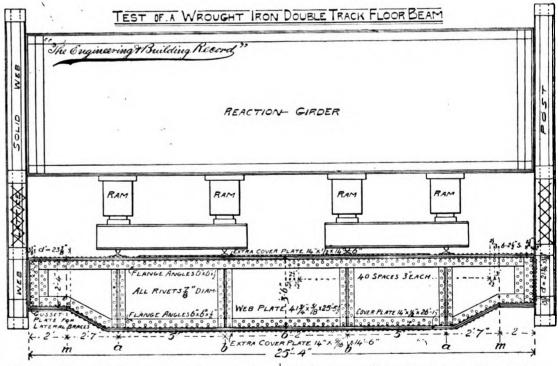

Shear strains in web, between a and end, 8,000 pounds per square inch at least section, or where web is 2 feet 4 inches deep, or 42 diameters between angle-iron.

RIVETS.

All rivets $\frac{7}{8}$ -inch diameter or $\frac{1}{2}$ when driven to fill holes; area of section 0.6 square inch; bearing-area, diameter \times $\frac{3}{8}$ plate = 0.35 square inch, and for $\frac{1}{2}$ -inch plate 0.47 square inch.

the test with the beam blocked up horizontal on the ground, so that the weight of the beam is necessarily neglected. The beam was connected with a pair of posts, precisely as in the actual structure, between which an additional girder was framed as a reaction base for the rams. The annexed diagram shows the general arrangements. The hydraulic power was derived from the testing-machine plant of the Keystone establishment, and the deflections measured from a fine wire parallel to lower flange, and about three inches therefrom. The diameter of the ram

Post attachment, considering all the 26 rivets doing duty, yields rivets strain as follows: In shear (single), 5,000 pounds per square inch, and bearing area (½-inch plate), 6,600 pounds per square inch.

Connection of 3/8 web to flange angles.—Taking the 40 rivets between ends of girder and second stringer, the horizontal strain difference is 162,000 pounds, the rivets being strained 3,400 pounds per square inch double shear, and 11,600 pounds per square inch bearing area. Taking distance from ends to first stringer, the horizontal strain difference is 105,000 pounds, yielding on 20 rivets, 4,200 pounds per square inch double shear, and 15,000 pounds per square inch bearing area.

Taking a short distance of two feet from ends, the horizontal strain is 70,000 pounds on 10 rivets, giving 5,800 pounds per square inch double shear, and 20,000 pounds per square inch bearing area.

In these girders the weakness feared was in the end flange riveting, and shear in end web, and caused the test recorded below.

The test was recently made at the works of the Keystone Bridge Co., by means of hydraulic power applied at stringer points; convenience made it necessary to make was ten inches. (Area 78.54 inches). The record was as follows:

	LOAD ON			
GAUGE	EACH RAM.	DEFLEC	TIONS.	TOTAL LOAD
READING.	Pounds.	В	6'	Pounds.
565	44,375	1/8"	1/8"	177,500
1,130	88,750	18	16	355,000
τ,412	110,900	3/8	3/8	443,600
No	permanent set in al	oove.		
1,695	133,125 unce	rtain.		532,500
Per	manent set scant 1	of an inch.		
1,980	155,500 not r	ecorded.		622,000
Per	manent set 5 of an	inch.		
2.080 Fail	ure commenced.			653,500

Failure commenced through giving way of angle-irons, beginning in a fine seam at first bend in lower flange from end support, the seam being along the root of the angle, which continual pressure tore apart across the angle as shown, when the web commenced to tear like a sheet of paper, in direction and manner as exhibited on plate herewith (from photograph). From some cause, not apparent, the deflections were not similar at the symmetrical end rams (a) the point where the web failed (left side) being sharply deflected. While the angles showed root fracture

Digitized by Google

^{*}Abstract of a paper read before the American Society of Civil Engineers, November 16, 1887.

at the opposite point, the web did not fail or show indications of so doing, the deflection being on an easy curve. With the extreme vielding of the lower flange angles, the angle brackets connecting girder with posts commenced to go, tearing likewise along the root, and stripping the heads from the extreme upper rivets as shown. The internal diaphragm connecting the channel sides of the posts was

The rivets connecting the ruptured flange with web appeared as perfect as when driven, and no indication was disclosed, as far as it was possible to tell, of the holes in the web elongating or any upsetting of bearing surface. There is no telling what the web and rivets would have borne had not the solid angle-irons given way at the first bend.

It is to be noted that flange-plate with leg of angle attached thereto was intact, showing no indication of rupture.

Discussion .- Taking that stage of the experiment when a permanent set was first noted—viz., $\frac{1}{82}$ of an inch—the recorded load was 532,500 pounds, or as near as may be 31/3 times the basis on which the calculations in the first part of this paper were made (40,000 pounds on each stringer, or 160,000 pounds total). Applying this ratio to the preceding computations, the iron would be apparently strained as follows:

When failure in angles was first noted, the recorded load was 653,500 pounds, or slightly more than four times the computed basis of load, which would increase the above strains about one-fifth, giving a calculated flange strain when angle failed of some 15,000 pounds per square inch, and bearing-area strain on end flange and web rivets about 80,000 pounds per square inch, neither of which could possibly be true, or the web would have torn out from the rivets, and the flanges be perfectly sound, well within elastic limits, although in the last case it is to be noted that the horizontal table of the flange was perfectly sound, the flange failure commencing primarily with a long split along the weld of the angle-iron root, throwing the whole flange duty upon the vertical legs of the angle-irons when a rupture strain was quickly reached. Had the angles been rolled from a solid ingot, or on the German method of developing from a flat instead of from the ordinary welded pile, the strength of this beam would have been largely increased. The prime weakness in this beam was due therefore to the mode of manufacturing the angle-irons, which were weak along the weld at the root. This was also shown in the end bracket-angles uniting the beam to the posts."

The writer deduces from this experiment that a plateweb is an exceedingly stiff member, much stiffer than is commonly supposed; that the customary method of proportioning rivets-viz., the horizontal component between any two given points divided by allowable bearing pressure per square inch equals number of rivets requiredis not true, and that the friction due to power riveting has enormous value.

This beam was reported to the company interested as practically safe by the writer, on general considerations, before the experiment was made, and the opinion reaffirmed after the experiment.

The paper was discussed by Theodore Cooper, who stated that the girder was not properly proportioned, as the ends of the beam in this design would be required to bear double the amount of strain it should bear, and the centre of member only one-half the amount.

He did not consider it defective in the strength required, but a better design could be constructed without increasing the cost. In computing the strains for bridge members the practice of French engineers was to consider the friction of rivets, but this friction was ignored by both English and American engineers. Mr. Brown followed by stating that in present practice we do not like to use a beam of this design; that there was not iron enough in the ends of web to resist the strains. It was also discussed by Messrs. Buck, Dagron, Devin, Buckholtz, Emery, Lindenthal. Pegram, and Lucius. The illustrations show a 'bird's-eye view of the beam as arranged for testing and an enlarged view of the fracture taken from a photograph.

PAVEMENTS AND STREET RAILROADS. No. XXI.

(Continued from page 7.

WOOD PAVEMENT IN THE METROPOLIS.* CORRESPONDENCE (CONCLUDED).

WITH reference to the number of experiments of the cement which he had made for the author, and which had cement which he had made for the author, and which had been published in their entirety, he should like to say that in every case he sent his report to the author on the completion of the seven days' test, and that therefore the extracts from these reports, which were given in the paper, were not to be considered as defining the nature of the cement as shown by future experiments, but simply as his opinion of the cement at that date. No doubt a finer ground cement would have been preferable, and would probably have enabled the author to obtain the strength he required with the larger proportion of aggregate—viz. e required with the larger proportion of aggregate—viz., to I instead of the 5 ½ to I which he found it necessary o use, and would therefore have resulted in economy; otherwise the cement was of good quality and well suited

to the purpose.

Mr. A. Southam observed that his experience as surveyor for the Wandsworth Board of Works at Clapham, enabled him to confirm the author's conclusions. In Octo-ber, 1880, the High Street Clapham was paved with wood by the London Tramways Company and the Wandsworth Board. In the centre of the road were two lines of tramway; these had been previously paved with several kinds of asphalt, and all had failed; the margins of the carriageof asphalt, and all had failed; the margins of the carriage-way were macadam. The tramway was paved under the direction of the engineer to the company, with plain deal blocks grouted with cement; the margins, 3,600 square yards, were laid by the Improved Wood Paving Company for the Wandsworth Board with blocks dipped in creosote on a bed of 6 inches of concrete, composed of Thames ballast and Portland cement, in the proportion of 6 to 1, at a cost of 11s. per square yard. The excavation was undertaken by the Wandsworth Board; the value of the macadam somewhat exceeded the cost of breaking up, carting, and sifting it for use elsewhere. The pavement had been maintained by the Improved Wood Company free of cost for three years, when they expressed their willingness to for three years, when they expressed their willingness to enterinto a contract to maintain it for a further period of fifteen years at 10d. per square yard per annum, and to leave it in good order at the end of that term; but although that was considered a small sum the board had thought it desirable to maintain it themselves. Both the pavement laid by the Improved Wood Paving Company and the laid by the Improved Wood Paving Company and the Tramway Company were in good order, no repairs having yet been required, and the work had been done nearly four years. In any extension of wood-paving he would use plain well-seasoned yellow deal wood blocks grouted with Portland cement, laid on concrete, formed of the old macadam, sifted and mixed with Portland cement. He considered that it was expedient to have large works executed by contract, but the maintenance should be undertaken by the parish authorities who had the control of the road.

Mr. G. F. White expressed his satisfaction with the paper, which he thought was a valuable supplement to those of Mr. Deacon and Mr. Howarth. Considerable experience had been gained in the intervening five years as to the endurance of wood as a pavement. The statistics collected by the author should help, he thought, to set at rest many questions on which opinions were divided some years back. There were two points on which he desired to offer a few remarks. The first related to the character of the foundation to be used under the wood. The second, to the mode in which the blocks should be laid with reference to one another. It seemed now to be quite agreed that the indispensable condition of securing a good and lasting paving was a firm and unyielding foundation, and it was also conceded that no material was so fit for this purpose as concrete made of Portland cement and gravel, in the proportions of I part of cement to 5 or 6 parts of gravel. The author seemed to be of opinion that a thickgravel. The author seemed to be of opinion that a thick-ness of 6 inches was sufficient for all purposes. Mr. White concurred in this view where the soil under the concrete was hard and undisturbed; but where the ground had to be picked up to provide for gas or water pipes, as was so generally the case, he thought the layer of concrete should not be less than 8 to 9 inches, especially in thoroughfares where the traffic was heavy. He had noticed in certain cases, and especially in Pall Mall, where the wood paving was probably in a worse condition than in any street in London, that the excavation for the concrete base had been very unequal in depth, the sub-stratum having in some cases been hardly removed at all, while in other parts there were holes 12 and 13 inches deep, which had been filled up with hard rubbish; and over this surface had been laid a bed of concrete, averaging hardly more than 3 inches in thickness. Such a mode of proceeding could only have one result, which had been predicted while the work was in progress—namely, the speedy breaking up of the pavement, with the namely, the speedy breaking up of the pavement, with the consequent necessity of replacing it within a year or two. As a matter of fact that was what happened. The paving showed signs of subsidence almost immediately; and though the middle of the roadway had been in part relaid, the generality of the work was in as bad condition as ever. The author had mentioned two cases in which the concrete had been laid 12 inches thick, and though in the one case (Regent Street) the advantage had been nullified by the inferior quality of the wooden road laid upon it, it was to be inferred from the description of another example in Parliament Street

*Appear by George Henry Stayton, Assoc, M. Inst. C. E. and

*A paper by George Henry Stayton, Assoc. M. Inst. C. E., and printed in the Minutes of the Proceedings.

that the life of the wood road would, in the author's estimation, be considerably increased by the extra solidity of the deep foundation. From a careful consideration of the whole question, Mr. White had come to the conclusion (1) that the concrete should in all cases have a thickness sufficient to make it act as a beam in bridging over these inequalities of excavation. (2) That the life of the wood inequalities of excavation. (2) That the life of the wood was in direct proportion to the immobility of the foundation, which must be deep enough to resist from the first the hammering action of horses' hoofs and the heavy pressure of wneels. The second consideration to which he would advert, was the way in which the blocks should be laid together in the roadway, and which resolved itself practically into a question of joints, or no joints. Now in the various pavings reported on by the author every sor of jointing seemed to have been tried, and though he had judiciously abstained from dogmatically asserting his judiciously abstained from dogmatically asserting his opinion, lest he should perchance be regarded as the paropinion. lest he should perchance be regarded as the partisan of any particular system, there seemed to be little doubt that he had a strong preference for laying the blocks together as closely as they could be put, and filling in the interstices with Portland cement grout. In this view Mr. White heartily concurred, and was glad to find it was also the opinion of Mr. Howarth. He believed that the use of grooves or wide joints, as affording foothold for horses, was of very doubtful advantage since when the paying was of very doubtful advantage, since, when the paving was perfectly dry or thoroughly wet, the foothold was complete, even with a jointless material like asphalt; and when plete, even with a jointless material like asphalt; and when the pavement was in the intermediate state of slipperiness, caused by frost or London fog, the grooved paving gave no more support to horses than did the close joint, the reason being that the mud filling of the joints, taken in connection with the rounded edges of the blocks, was rather a cause than a preventive of slipperiness, which was altogether absent in the case of the continuous paving. Another argument against setting the blocks apart was the fact that their being so set helped the abrasion and rounding of their arrises, which was not only in itself an element of deterioration, but tended after a time to create a sort of corduroy road, on which the wheels bumped from one block to another, producing thereby a jar very detrimental to comfort in driving over it. If any proof were needed of the correctness of this statement, one had only to drive in Oxford Street, over the road running from the Marble Arch eastward, to feel the difference in smoothness and comfort of the close-jointed pavement in comparison with the grooved and bumpy road which succeeded it further Mr. White had been told by omnibus drivers, who were

excellent judges, that if the wide-jointed pavements were universal in London streets, there would not be a driver without a spinal complaint at the end of a twelvemonth. As regards the direction in which the blocks should be laid in relation to the street, there would seem to be laid in relation to the street, there would seem to be no doubt that it should be transversely to its length, like ordinary stone paving. In the paving before referred to in Pall Mall, the blocks had for some inscrutable reason been laid diagonally, than which nothing could be imagined more unsafe for horses, or more predjudicial to the comfort of those who drove over them, especially when the joints were, as in the case of one exhibited, 1½ inches in this particular payment appeared from in thickness. This particular pavement appeared from the author's statement to have been constructed at a cost the author's statement to have been constructed at a cost of about 8s, per square yard, about one-half the price at which most other roads had been laid. It was in his knowledge that the expense of making it had been largely subsidized by the clubs and the War Office, who had not taken the ordinary precaution of employing an inspector to watch its construction, but had left it entirely to the parochial authorities, of whose parsimony and ignorance it remained unhappily a convincing proof. It was to be hoped such a state of things would not easily recur, though he was not without fear that the neighboring roadway of hoped such a state of things would not easily recur, though he was not without fear that the neighboring roadway of Cockspur Street and Charing Cross, quite recently laid, would manifest before long the consequences of insufficient foundation. This led him to inquire whether it was impossible to institute some more authoritative control than at present existed over the construction of the wood roads of London. The information gathered by Mr. Howarth and by Mr. Stayton was as ample and specific as would have been collected by a select committee sitting on the question, and must surely therefore be sufficient as a guide to some uniform plan for select committee sitting on the question, and must surely therefore be sufficient as a guide to some uniform plan for the execution of such works. The question then became whether such uniformity could be enforced on the different parochial bodies of the Metropolis. The roadways were for the comfort of the whole community—not of individual parishes; and he could heartily wish that such a body as the Metropolitan Board of Works, which seemed to have most things under its management, could actively inter-vene to give the ratepayers the benefit of the investigations which had been made on the subject, instead of leaving them any longer to be the victims, both in pocket and in comfort, of every experimenter who might have a nostrum to recommend or a patent to push.

Mr Stayton, in reply to the correspondence, remarked

that such observations as those made by Mr. Culver-well were extremely practical and valuable. He, how-ever, felt compelled to reassert his opinion that the pitch-pine blocks in King's Road created an unpleasant 'jarring' motion when driving over them. He had many times experienced it, and on a recent occasion the effect was very apparent. Possibly this evil could be mitigated by the application of Henson's felt bed and joint. He was glad that Mr. Culverwell had so clearly expressed his reasons for declining to support the creosote theory, feeling convinced that the extra cost of creosoting could be better expended in the selection of the timber. He concurred

in Mr. Delano's objection to the terms "asphalt" and "asphaltic" as applied to the wood pavement laid by the Asphaltic Wood Pavement Company; obviously the British asphalt used by them was a manufactured article, and the name might lead to confusion. Where the word "asphaltic" appeared in tables, it merely referred to the "Asphaltic" Company's system, in the same way that "Henson's" or the "Improved" systems had been referred to. He did not find that the wood in Chelsea "gave off poisonous emanations under a hot sun," although it had been laid 5½ years; this fact, however, could be accounted for, because its surface was thoroughly watered and machine-swept twice a week during the summer, independently of the attention described under the heading of management. Any neglect of this service, however, would soon create the unpleasant condition described. He assumed that it would be taken for granted that the thickness of concrete foundation referred to by Mr. White (six inches) would only be adopted where the soil was hard and undisturbed, and he could refer to numerous instances in the Chelsea pavements where the thickness from 8 to 10 inches; in fact, a depth of 12 inches had been laid for a long distance over the site of a suspicious gas trench in Sloane Street.

(To BE CONTINUED.)

AN ELECTRIC TIDE-GAUGE.

La Lumière Électrique describes an electric water-level indicator and recording apparatus made by C. & E. Fein, of Stuttgart, which, it is claimed, affords a simple means for making daily observations of the level of rivers, tides, etc. It consists of a float which is placed in the bottom of a closed cylinder which communicates with the body of water by means of a spiral tube so as to avoid all irregularities by the motion of the water. The float is connected with a pointer which revolves in front of graduated circle and indicates the height of the water. The axle of the pointer controls a pencil connected with the recording device. This device consists of a drum carrying ruled paper, whose vertical lines indicate intervals of fifteen minutes, while the horizontal lines equal intervals of one decimeter, indicating height of water-level A pencil controlled by an electro-magnet is moved by operation of the clock movement from left to right over the paper. At every fifteen minutes the clock movement also operates to close circuit and actuates the electro-magnet, which then causes the pencil to make a dot on the ruled paper. The paper on the drum is ruled for 27 hours and must be changed daily. The dots show the variations in the water-level in the form of a curve. The entire apparatus (except the float and its cylinder) is in an ornamental box. The dial shows the height of the water by inspection at any time. The ruled paper serves for a record

A WATER-TOWER FALLS AT THOMASVILLE, GEORGIA.

A DISPATCH to the New York Herald indicates that the epidemic of disasters to water-towers has not yet ceased, and, as we warned our readers a short time since, the immunity from personal disaster that has thus far obtained could not be expected to continue. A water-tower in process of erection at Thomasville, Ga., fell on the 6th inst., instantly killing four men, among them the contractor, J. P. Rommerdall, and seriously injuring four more.

The masonry intended to support the tank had reached a height of about seventy feet, when the removal of some bracing permitted the vibrations due to the hod-elevator to overthrow the central pier, some six feet in diameter, which in its turn destroyed the outer wall and the surrounding scaffolding.

It will be remembered that the jar of the hod-elevator was also the proximate cause of the fall of the Harlem school-house, in this city, by which seven men were killed. Perhaps the hod-elevator may be a blessing in disguise, serving to test the stalility of a structure during erection, and thus, perhaps, preventing a more serious disaster later on, for it does not seem as if any properly constructed edifice would be destroyed by such a cause.

THE St. Louis Daily Globe Democrat of the 4th inst. contains a long and very fully illustrated popular article on the manufacture of illuminating gas, which will be interesting and instructive to gas consumers, and perhaps restore some of their lost confidence in the gas companies and their mysterious and much-suspected representative, the gas-meter.

SOME DETAILS OF WATER-WORKS CONSTRUCTION.

No. V.

(Continued from Vol. XVI., page 710.)
BY WILLIAM R. BILLINGS, C. E.,
Superintendent of Water-Works, Taunton, Mass.
HYDRANTS, GATES, AND SPECIALS.

STREET intersections are obviously suitable places for hydrants and gates.

A hydrant so placed serves more territory than one placed in the centre of a street line, and at the intersection of important thoroughfares and large mains the four-way hydrants carrying four hose-nozzles are in every way suitable, if post-hydrants are chosen.

For the narrow crowded streets of a large city the flush hydrants are better than the post, but, as a rule, the small water-works which have sprung up all over the country during the last few years are fitted with hydrants of the post pattern.

If a post hydrant is not placed near a street corner, it is well to put it on a division line between two estates, for the chances that it will in the future be an obstruction are smaller in this position than they can well be in any other. The distance apart for hydrants may be 200 or 500 feet, according to circumstances, but the larger distance should not be exceeded without the best of reasons.

It has become a well-established custom to place gates on street lines, and the ease with which gates so placed can be found is a sufficient reason for not departing from the custom except in some special cases. In unpaved streets a gate-box located at a corner on a street line may be a source of trouble if the travel about the corner is considerable, for the wearing of the road will soon leave the box projecting above the surface to a dangerous extent. In cases where this condition of things is likely to obtain, the writer has thought it wise to move the gate ten feet away from the street line, and it is fair to ask if a uniform distance of ten feet would not have some advantages over a strict adherence to street lines.

The superintendent or the engineer or his assistant should follow the pipe-laying gang closely enough to locate every gate and special before it is covered by the back-filling gang. If one should perchance miss the location of something, he will be both surprised and amused to see how wild and yet how confident will be the guesses of a bystander who saw the gate covered the day before, and then tries to assist one in finding it.

In locating and making notes for future reference, a little judgment is required to enable one to choose permanent and easily found landmarks.

Fences and stone-bounds come first, as a rule, and the post-hydrants furnish excellent measuring points. Lampposts are reasonably permanent, but trees and hitchingposts illustrate the "mutability of human affairs" of Dominie Sampson. A rough sketch, with no regard to scale, will be found more intelligible after sixty days than a written description.

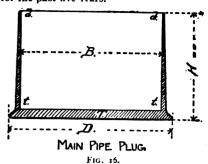

As a rule, it does not pay to build gate-boxes so that a man can get into them to oil and pack the gates. In paved streets, where digging is both expensive and inconvenient for the public, large brick manholes are of course demanded, but for town and country the cast-iron gate-boxes, well known to the trade, leave little to be desired.

The writer has heard of main-pipe specifications which called for a bed of concrete under each gate and hydrant. Under a hydrant in wet uncertain ground it may have some value, but under a gate there seems to be no call for it; indeed, it may be a source of trouble should the pipe settle a little and the gate be unable to follow. When a hydrant is placed in an ideal manner, it has a firm foundation in a large flat stone or good earth, good backing of stone or well-rammed earth, and perfect drainage. If a sewer is not available, fair drainage may be secured by surrounding the base of the hydrant with broken or round stone, provided the ground has any absorbing power, and in clay, a small well may be sunk at some distance from the hydrant, enough below it, and of sufficient diameter to contain three or four times as much water as the hydrautbarrel will hold. A small drain is then run from the hydrant to the well and the well is pumped out as often as need be.

Frost-jackets seem to be going out of fashion. Without doubt they have little value in sandy or gravelly soils. In clay the action of the frost may be expended on the jacket and so save the barrel some straining, but men of experience are not wanting who declare that frost-jackets should fall into "innocuous desuetude,"

As a rule, the plugs for main-pipe furnished by the foundries are unnecessarily heavy, unless made from special patterns.

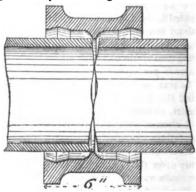

In Fig. 16 is shown the pattern adopted and used by the writer for the past five years.

The following table gives the dimensions for plugs to be used with four, six, eight, and ten inch pipe:

Size of Pipe.	D	В	н	Т	t	ď
4 6 8	5¼ 7¼ 9¼ 11¼	4 6 8 10	6 6 6	% % %	KKKK	XXXX

The sleeve shown in Fig. 17 differs from the ordinary pattern only in having an inside rim which furnishes a support against which the joints can be made. The diameter of this rim should be fixed with some care and with reference to the outside diameter of the pipe with which the sleeve is to be used; for unless the sleeve will slip over a pipe from which the spigot end has been cut, the chief advantage of this special casting will be lost.

MAIN PIPE SLEEVE FIG. 17.

Sleeves are all but indispensable in bringing two parts of a pipe-line to a junction between two rigid points, and they may be found useful in assisting one to use up pieces of pipe without bells. Some foundries make their special castings with bells all around, while others send out their single and double branches, with spigots on one end of the main run. The writer has found the "bells all round" pattern to be the most economical in the way of using up the pieces, but on every job of magnitude cases will arise in which the spigot-end special will save cutting pipe-

If practicable, main-line junctions should be made with specials a size or two larger than the pipe—that is, two 8-inch lines may cross each other at right angles, though a to-inch double branch, and the New Bedford pipe plan by Mr. Coggeshall, given in a previous chapter, furnishes another case in point.

BACK-FILLING.

The best possible work in back-filling a trench is done with water, but oftener than not, perhaps, we must be content with ramming and tamping the dry earth. If time enough is put into it, and there is only one man shoveling to each man with a tamp, good work can be done without water, but such a method is expensive and with contractors, as a rule, it is not in favor. The best results with dry earth are obtained when the dirt is spread evenly in layers, not more than six inches thick, and each layer is thoroughly tamped and trodden before another is added.

If he works as he should the man in the trench will find the pounding and treading harder than shoveling, and to even things the shoveler and tamper may change places several times during the day. If water is used it should not be in such excess as to make "pudding" in the trench, and the amount of wetting must be proportioned to the absorbing power of the filling. The water does its work by carrying down the fine particles of earth as it soaks away, and more than enough to do this thoroughly is not

If the trenching has been properly done, the top of the street—that is, the good gravel, or the macadam—has been put by itself on one side and should be raked over, been put by itself on one side and should be raked over, and the stones and fine material separated; the stones to be put in just under the surface which is to be finished with the fine material. The amount of crowning to be given the top of trench should depend upon the thoroughness with which back-filling has been done, the size of the pipe, and the character of the soil. If a trench has been well filled a rise of six inches is ample, and if this does not settle down even with the road after one or two hard rains

Pipes should be filled slowly and carefully, because under certain conditions great damage may be caused by too rapid filling. A long line should be filled one section at a time, and no gate before an empty section should be fully opened until positive evidence can be had that the section is filled. If the line to be filled carries hydrants, the air can be allowed to escape through them, but if these outlets cannot be had air cocks on the sumbut if these outlets cannnot be had air-cocks on the summits are necessary.

A special form of air-cock can be had in the market, but

for ordinary use any convenient form of corporation cock may serve the purpose by arranging a lever handle and a

was thought best to discuss them together. (Abstracts

of papers will be given hereafter).

Mr. C. J. H. Woodbury, of Boston, spoke of two improved methods of heating; first, that just mentioned, in which a blast of air is forced through coils of steam-pipe into the space to be heated. This method, he said, took less steam-pipe and could be better regulated than the radiator system. He then referred favorably to the overhead system, in which the pipes are suspended from the ceiling. This, he said had been ridiculated at first, but were residily explained. he said, had been ridiculed at first, but was rapidly gaining

ground.

Mr. Daniel Ashworth, of New York, then spoke on the subject of the power required for driving blowers, which, he said, was far higher than the lists of makers of blowers would indicate. He also stated that closing the outlet aperture of fan-blowers decreased the power required to drive the blower

Professor J. E. Denton, of Hoboken, differed from Mr. Professor J. E. Denton, of Hoboken, differed from Mr. Ashworth, and believes that the tables of power needed for fans, as published by Sturtevant, are correct. He also thinks that positive blowers are better for strong blasts than fan-blowers. The cost of the lacing of belts is a considerable item in fan-blowers.

Mr. William F. Mattes, of Scranton, said that he had tried first Sturtevant blowers, then Baker blowers, without satisfaction: finally, by getting larger Sturtevant blowers.

satisfaction; finally, by getting larger Sturtevant blowers, obtained good results. He therefore thought that many condemned them, as he had, when they did not have large enough ones.

Fan-blowers, he said, cost less, and with them there

was less waste from leakage in the pipes.

Mr. Schuhmann then pointed out a difference between positive and fan-blowers in the fact that a reduction of area of outlet increased the requisite driving power with positive blowers, while it decreased it with fan-blowers; therefore fan-blowers are more economical than positive,

therefore tan-blowers are more economical than positive, if run very often below full capacity.

E. C. Felton, Penn Steel Co., said the Penn Steel-Works started with Sturtevant blowers, but afterwards took them out and put in Baker blowers. He thinks positive the started blowers are more economical than positive. itive blowers are better for pressures of twelve ounces and

upwards.

R. H. Thurston, Cornell University, thought proper account had not been taken concerning the best shape of blade, and says that though they should be curved, the curvature is often too great, and that the proper curvature is dependent upon several conditions, chiefly upon the speed of revolution. He cited a case where a fan running in the wrong direction had failed to give any perceptible

pressure.

Mr. W. B. Le Van, of Philadelphia, Pa., then, in a few remarks referring to both papers, showed his approval of the method of heating offered by Mr. Snell, and cited the fact that it ventilated as well as heated.

Professor Denton arose to defend Rankine's formula for the curvature of the blade, and said that no experiments had been sufficiently well carried out to disprove its correctness, even if they seemed to point that way.

ments had been sumcerely wen carried out to disprove its correctness, even if they seemed to point that way.

Mr. Snell then arose in favor of positive blowers with about the same reasons as given by Mr. Schuhmann. He opposed the idea of there being any marked difference in

opposed the idea of there being any marked difference in efficiency due to shape of blades.

Professor R. H. Thurston's paper on "Internal Friction of Non-Condensing Engines" came up next. It was discussed by J. E. Denton, H. R. Towne, Samuel Webber, and William Kent, all of whom agreed very nearly with the paper, and the general conclusion was that the friction was about constant under varying loads.

Mr. Oberlin Smith, of Bridgeton, N. J., then presented his paper on "Power-Press Problems," which was discussed by Messrs. Grant, Lewis, Stiles, and Coffin.

In the afternoon different parties visited several points.

cussed by Messrs. Grant, Lewis, Stiles, and Coffin.

In the afternoon different parties visited several points of interest to the profession, the most prominent of which were the works of the following companies: William Cramp & Sons' Ship and Engine Building Co., where the following work on hand was examined:

U. S. Cruiser "Baltimore."—Length, 335 feet; breadth, 48½ feet; mean draught, 19½ feet; tons, 4,400; horizontal, triple expansion, twin-screw engines; four double-ended tubular boilers, 135 pounds steam; 9,000 indicated horse-power.

brose-power.

U. S. Gun-Boat No. I (no name.)—Length, 230 feet; breadth, 36 feet; mean draught, 14 feet; tons. 1,700; horizontal, triple-expansion, twin-screw engines; four cylindrical locomotive boilers, 160 pounds steam; 3,000 indi-

cated horse-power.

U. S. Pneumatic Dynamite-Gun Boat (no name.) Length, 246 feet; breadth, 26½ feet; mean draught, 8½ feet; tons, 700; three 15-inch guns; vertical, triple-expansion twin-screw engines; four cylindrical locomotive boilers, 160 pounds steam; 3,500 indicated horse-power; speed, 20 knots.

Machinery for Steamboat "Connecticut," Stonington Line.—Diagonal compound side-wheel engines; six cylindrical locomotive boilers, 110 pounds steam; 5,000 indicated horse-power.
Steamboat for Central Railroad Company of New Jersey,

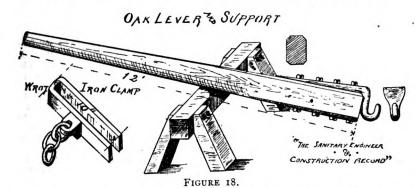

Sandy Hook Route.—Length, 250 feet; breadth, 35 feet; mean draught, 10 feet; vertical triple-expansion, twinscrew engines; four return tubular boilers, 160 pounds

steam; 2,500 indicated horse-power.

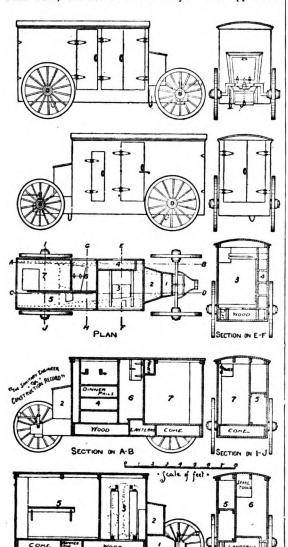

U. S. Cruiser "Newark."—Length, 310 feet; breadth, 49 feet; mean draught, 18½ feet; tons, 4,083; horizontal, triple-expansion, twin-screw engines; four double-ended return tubular boilers, 160 pounds steam; 8,500 indicated

brise-power.

U. S. Cruiser No. 4 (no name.)—Length, 335 feet; breadth, 48½ feet; mean draught, 19½ feet; tons, 4,400;

it will have to be cut down if the road surveyor does not want to wait for wear and tear to level it. Some contractors prefer to fill without much tamping, crown the trench a foot, and then either repair the road after a month or two or deposit with the superintendent of streets a sum large enough to cover the cost of repairs. If sand has been taken from the trench it will ruin any road if allowed to come near the surface by working up through a thin been taken from the trench it will ruin any road it allowed to come near the surface, by working up through a thin layer of good road material. If sheet piling has been used it may be removed after the trench is half fi!led by means of a clamp and lever shown in Fig. 18. A 4x6 stick, a piece of chain, and a pile of blocks may be made to do the same work, but not so conveniently. The apparatus

shown in Fig. 18 is copied in part from a blue print presented at one of the meetings of the New England Water-Works Association by Mr. William B. Sherman, M. E., of Providence, R. I. The horse should be well braced with iron rods, and may be protected on top by a plate of light tank-iron.

SECTION ON C-D

blow-off pipe to be operated at will. In concluding the main-pipe division of his subject the writer presents in Fig. 19, sketches of a tool wagon for use in main-pipe or sewer construction. The drawings are made from blue prints presented by Mr. R.C. P.Coggeshall, Superintendent of the New Bedford, Mass., Water-Works, at one of the meetings of the New England Water-Works Association.

TOOL-WAGON.

R. C. P. Coggeshall, Superintendent, New Bedford Water-Works.

This tool-wagon was planned by Mr. Ashley, foreman of this department, and was built by the regular employees during the winter months, at intervals whenever an hour or two could be spared. The cost as given below would in consequence probably exceed the amount at which this tool-wagon could be built by contract.

ESTIMATE OF COST. ESTIMATE OF COST. Set of wheels and pole. \$31.00 Axies \$10, bolts \$3... 13.00 Door-pulls, 50c., 4 bolts \$1.40 1.90 6 pair hinges \$1,4 pair back-flaps 40c 1.40 7 pair strap-binges \$1.33, 1 doz. hooks 60c 1.93 3 chain bolts 90c., 10 feet chain \$1. 1.90 Screws \$4.16, nails \$2.15 6.31 303 feet 1-inch matched pine, planed 15.58 153 "spruce 3.52 130 feet 2-inch spruce, planed 2.33 Blacksmithing 30.49 Labor and painting 105.00 Amount\$214.36 CONTENTS. Goose-neck, Paving-pounder and hammer, 3 stone chains, 3 wheelbarrows of wood, 2 buckets of clay,

4 sets of lead and gasket irons,
4 drailing hammers,
1 stone hammer,
2 dozen cold chisels,
6 diamond points,
6 cutting-out irons,
12 joint wedges.

- 4 lengths hose. 40 picks and shovels, 3 stone sledges, 6 striking hammers, Hydrant key,

20 dinner-pails. Tackle, Nails and Hammers. Small locker for spare tools, Plug drill box, 9 lanterns and oil-can.

6-toot measuring-stick.

Can, powder and fuse, 3 hoes, coil gasket, 6 pigs lead, furnace, 2 barrels coke, lead kettle and spoon, bell pole, saw, tamping bar, 12 buckets, 6 lantern sticks, 4 iron bars, 14 blowing-drills.

(TO BE CONTINUED.)

ANNUAL MEETING OF THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS.

THE eighth annual meeting of the American Society of Mechanical Engineers was held in Philadelphia at the Continental Hotel, from November 28 to November 30,

The opening address, by the President, Mr. George H. Babcock, of New York, was a carefully prepared and scholarly production, and it is a matter of regret that it is impracticable to reproduce it here.

It eloquently referred to engineering as a divine commission from God given in the command to our first parents to "replenish and subdue the earth," the latter part of which has been largely the work of the mechanical engineer.

Professor John E. Sweet's paper on "A New Principle in Steam-Piston Packing" was then taken up and discussed by Messrs. William Kent, De Volson Wood, George S. Strong, Frank H. Ball, Angus Sinclair, George H. Babcock, Daniel Ashworth, Thomas R. Almond.

Tuesday morning's session opened with the reports of the committees, which, all told, showed the society's affairs

the committees, which, all told, snowed the society's affairs to be in a most prosperous condition.

Following this the first papers taken up were those of Mr. John I. Snell and Mr. Henry I. Snell, and as the first was on "Experiments and Experiences with Blowers," and the second on an "Economical Method of Heating and Ventilating an Office and Warehouse Building," which was by the use of blowers driving air through steam-coils,

horizontal, triple-expansion, twin-screw engines; four double-ended return tubular boilers, 160 pounds steam; 9,500 indicated horse power; speed, 19 knots.

Total indicated horse-power on hand, 41,000

At the I. P. Morris Company the following of the plant designed by E. D. Leavitt, Jr., for the Calumet and Hecla Mining Company, and now approaching completion, was examined with much interest:

Hoisting-engines, "Houghton and Seneca."—Triple-

Hoisting-engines, "Houghton and Seneca."—Triple-expansion, direct hoisting beam-engines, cylinders, 18 inches, 27¾ inches, and 48 inches diameter, 7 6" stroke; boiler-pressure, 180 pounds; shafts, links, connecting-rods, and crossheads of crucible steel, made by Krupp.

Hoisting-drums for above engines.—Two drums, large, diameter, 25'9", small, diameter, 14'3", length, 12 feet, to be turned and grooved for 5,466 feet of 1¾-inch rope. Shafts for drums, 22½ inches in diameter, 29 feet long, weighing 32,000 pounds each.

Clutch fly-wheels.—Two wheels of 30 feet diameter. Total weight of engines, including drums, shafts, flywheels, and outboard pedestals, about 800 tons.

Air-compressors.—One pair coupled air-compressors, plungers, 42 inches diameter, 60-inch stroke, driven by spur gearing with cut teeth, wheel, 20 feet diameter, 30-inch face, mortise pinion, 10 feet diameter. Total weight, 250 tons.

250 tons.

Steam stamps.—Six stamps, cylinders, 21 inches diameter, valve gear driven by belting. (For description, see "Transactions of the American Society of Mechanical Engineers, Vol. VI., page 370.)

Locomotive boilers, Belpaire type.—Six boilers, diameter of chell considers, total length.

Locomotive boilers, Belpaire type.—Six boilers, diameter of shell, 90 inches, total length, 34'4", extreme width, 10'4½", height, 8'9", 199 3"x16' tubes. Working pressure of finished boilers, 135 pounds, and shipping weight 74, 100 pounds each. Working pressure of incomplete boilers, 180 pounds; estimated weight, 85,000 pounds each. All of "Otis" steel. In addition to above there were in course of construction:

Hoisting-engine "Gratiot."—Same as engines previously described.

Pumping-engine "Michigan."—Cylinders, 18 inches,

Pumping-engine "Michigan."—Cylinders, 18 inches, 27¾ inches, and 48 inches diameter, 76 stroke, 2 pumps, differential plungers, 34 inches and 48 inches diameter, 76 stroke, the steam end of this engine being of almost exactly similar design to the hoisting-engines.

Hydraulic gear.—For operating clutches and brakes for hoisting-engines.

Drum indicator gear sharms

Drum indicator gear, sheaves, hangers, and shafts for

Drum indicator gear, sheaves, hangers, and shafts for leading hoisting rope, steam drums, steam pipe, stop-valves, etc., etc., steam chests, etc., of steel castings made by Thurlow Standard Steel Co.

The works of William Sellers & Co., the Baldwin Locomotive Works, the docks and coal yard of P. & R.R. R., where are the coal-handling appliances described in the paper by Mr. James M. Dodge, were seen in operation.

Tuesday evening's session opened with Mr. John J. Grant's paper on "The Milling Machine as a Substitute for the Planer." It was discussed by Messrs. Henry R. Towne, Charles Potter, Jr., J. B. Webb, J. E. Sweet, W. F. Durfee, J. T. Hawkins, none of whom differed in any marked degree from position taken in Mr. Grant's paper.

Mr. Frank Van Vleck's paper on "Standard Section Lining" was then taken up and discussed in a lively manner from several different standpoints by Messrs. F. R. Hutton, John J. Grant, Henry R. Towne, F. N. Will-

manner from several different standpoints by Messis. F.
R. Hutton, John J. Grant, Henry R. Towne, F. N. Willson, F. A. Halsey, John Coffin, J. B. Ladd, J. E. Sweet,
J. E. Denton and W. H. Weightman. The object of the
paper was the appointment of a committee for adopting a standard for section lining; it was, however, voted down by the society.

The next paper was by Mr. Percy A. Sanguinetti on "Divergencies in Flange Diameters of Pumps, Valves,

It was discussed by Messrs. Samuel Webber, F. W. Taylor, H. R. Towne, W. B. Le Van, W. H. Weightman, A. H. Raynall, William Kent, W. F. Mattes, J. T. Hawkins, J. E. Sweet, and E. F. C. Davis. The result of the whole being the appointment of a committee who should endeavor to bring about a uniform standard.

Mr. William O. Webber's paper was next read by Mr. Hutton on "Centrifugal Pumps and their Efficiencies," which brought out discussion from Messrs. R. H. Thurston, De Volson Wood, Hugo Bilgram, and J. E. Denton, in which it was agreed that they came under the same principles as blowers and that the shape of the vanes desended upon the speed of revolution. pended upon the speed of revolution.

Early Wednesday morning quite a party of engineers assembled at the Broad Street Station to take a train for Tacony by invitation of Henry Disston & Sons, at whose works they were shown much that was of professional interest, their method of compressing steel ingots and their new fuel-gas plant on the "Loomis" system attracting much attention

their new fuel-gas plant on the "Loomis" system attracting much attention.

On resuming the reading of papers that by Professor Gaetano Lanza on "Friction in Toothed Gearing" was first taken up, with discussion from Messrs. H. Bilgram, Wilfred Lewis, J. E. Denton, and J. T. Hawkins.

Professor Lanza then presented a second paper, the joint work of Jerome Sondericker and himself, on the subject of "Investigations as to How to Test the Strength of Cements," which elicited discussion from Willard P. Parsons, who noted that it was upon such ground as this that the work of civil and mechanical engineers approached that the work of civil and mechanical engineers approached

Mr. Parsons did not agree with Professor Lanza as to the amount of the effect of oblique direction of strains in testing, and he thought more importance should be

attached to the proper mixing of cements, and in the steady and constant application of the strains in testing.

Professor Denton asserted himself as agreeing with the paper. Professor Lanza then arose stating that all the

requirements named by Mr. Parsons had been strictly ful-filled in experiments to which he referred.

Mr. Parsons then presented a paper of an allied nature, entitled "Influence of Sugar Upon Cements," which gave evidence of the beneficial effect of small percent-

gave evidence of the beneficial effect of small percentages of sugar in many cases, but the very destructive effect of large amounts.

Mr. J. E. Denton then wished to know if sugar had been used to any appreciable extent in practice; and also stated that as great care seemed (from Mr. Parsons' paper) necessary in the mixing of the sugar with the cement in order that any benefit might be derived, it would seem best to try to keep sugar out as far as possible.

ble.

Mr. John Coffin's paper on "Steel Car-Axles" was next presented and attracted much attention. It was discussed by William O. Webber, William Hewitt, J. E. Denton, E. C. Felton, T. R. Almond, F. W. Taylor. H. S. Haskins, and H. R. Towne.

The next paper, entitled "Results from Steel Tested Shortly After Rolling," by Mr. Edgar C. Felton, pointed to the conclusion that steel after rolling went through a certain process (which he termed "seasoning" for lack of a better word) which caused it to become stronger, and

certain process (which he termed "seasoning" for lack of a better word) which caused it to become stronger, and hence it would not be just to the maker to test it immediately after rolling. The paper was discussed by Messrs. Jacob Reese and William Hewitt.

The next paper, "The Use of Kerosene Oil in Steam-Boilers," by Mr. Lewis F. Lyne, brought discussion from Messrs. Ridgeway, F. A. Halsey, Engel, and Denton, all of whom differed, except that it would always be well to have the scale in the boiler analyzed, as it might thereby become possible to tell what might remove it.

of whom differed, except that it would always be well to have the scale in the boiler analyzed, as it might thereby become possible to tell what might remove it.

Mr. J. M. Dodge's paper, entitled "Method of Stocking and Reloading Coal," brought out some questions from Messrs. M. T. Davidson, and W. F. Mattes.

The next paper, by Mr. O. C. Woolson, on "Railroad Bed for Bridge Structures," in which a built-up elastic tie is used, seemed to meet with the general approval of the society and was but little discussed. Professor Denton said that he had noticed on the elevated roads in New York that used this tie a perceptible improvement in the smoothness of motion in traveling over the road.

Mr. C. E. Emery's paper, "An Interesting Indicator Diagram," was read by and brought a few remarks from Professor F. R. Hutton, but excited no discussion.

The last paper, "Improvement in Shaft Governors." by M. F. H. Ball, brought out remarks bearing upon various forms of governors, and reaching over the space of forty or fifty years. The following persons joined in: Messrs. J. Burkitt Webb, J. T. Hawkins, George H. Babcock, J. E. Denton, Walter C. Kerr, H. Bilgram, L. F. Lyne, M. T. Davidson, J. B. Ladd, and W. R. Warner.

There were ten topical questions on the programme of

There were ten topical questions on the programme of the meeting, though but few of them brought out any remarks. The question, "What is the Best Material for Lining Brake-Straps on Elevators, Cranes, etc.?" was answered by Mr. E. D. Leavitt, Jr., as follows: That he had gotten the best results from soft woods, such as popular alleged upon the drum (not as a lining of the brake. lar, placed upon the drum (not as a lining of the brake-straps, the straps bearing upon the wood being of metal. At the Calumet and Hecla Mines these lasted about a month. Water ran constantly on the wooden casing of

Resolutions of thanks for the unbounded hospitality and attention shown the society were adopted with cheers.

An elegant reception was tendered the society by the citizens of Philadelphia at their Academy of Fine Arts. Paintings, a fine orchestra, a bountiful supper, and beau-

Paintings, a fine orchestra, a bountiful supper, and beautiful flowers adding to the enjoyment of the occasion.

Thursday was devoted to an excursion to Bethlehem, Pa., as the guests of the Bethlehem Iron Co. A special train was provided for the society. While on the way cigars, sandwiches, bananas, and grapes were freely passed around and partaken of. All which, together with the expense of the excursion trip, and also a most excellent lunch at the office of the works, was the courtesy of the Bethlehem Iron Co.

Carriages were found awaiting the party at the depot,

Carriages were found awaiting the party at the depot, and the majority got into them and drove up to Lehigh University. The Zinc Works were next visited, then the University. The Zinc Works were next visited, then the Bethlehem Iron Co. The train came down into these works at 4:30 P. M. where all took the train and returned to Philadelphia.

Complimentary tickets having been previously supplied to the members of the society they were entertained on Thursday flight by Booth and Barrett in "Julius Cæsar" and by the opera "Erminie."

Thus closed the eighth annual meeting of the American Society of Mechanical Engineers, the largest and most

successful ever held by that body.

The following members were present:

Life Members.—Charles Wallace Hunt, New York;

Julio Frederico Sorzano, New York.

Members.—Otto Albrecht, Philadelphia, Pa.; Robert

Members.—Otto Albrecht, Philadelphia, Pa.; Robert Allison, Port Carbon, Pa.; Thomas R. Almond, Brooklyn, N. Y.; Daniel Ashworth, Pittsburg, Pa.; George H. Babcock, New York; Stephen W. Baldwin, New York; Frank H. Ball, Erie, Pa. J. Sellers Bancroft, Philadelphia, Pa.; George A. Barnard, Hartford, Conn.; William H. Barr, Brooklyn, N. Y.; Arthur Beardsley, Swarthmore, Delaware County, Pa.; Alfred Betts, Wilmington,

Del; William Betts, Wilmington, Del.; Hugo Bilgram, Philadelphia, Pa.; George M. Bond, Hartford, Conn.; James C. Brooks, Cambridge, Mass.; H. W. Buckner, New York; J. M. Loring, Washington, Del.; William C. Macki

SOME SKETCHES OF PLUMBING IN THE RESIDENCE OF WILLIAM F. WELD, ESQ., BROOKLINE, MASS.

No. 1V.

(Continued from page 10.)

FIGURE 12 is a view within the plunge-bath room. The bath proper is set in the floor and can be entered by two steps at one end. It is made of $2\frac{1}{2}$ -inch oiled soapstone slabs, tongued and grooved and held together by brass bands. It projects down into the ceiling of an unimportant room, and all its pipes are exposed and accessible from below. A standing overflow is used and it is placed in the corner of the tub, as may be seen. The finish of the tub, back and end slabs, and casing for faucets are Italian marble. The walls are white-glazed tiles and the floor buff tiles. The shower-bath is operated from the end. A window high above the floor is placed at the foot of the

buck-stays are used at the centre and iron rods at the top and bottom are carried across to hold the long sides. The laundry tank is 6x4x2 feet and similarly made; they are both lined with 18-ounce copper.

An artesian well 217 feet deep supplies water for flushing purposes. The water from this well is forced to the house by a Deane "deep-well" steam-pump at well. The drinking supply comes from a dug well, which is 45 feet deep; a double Coleman pump is used for this purpose and is situated in the cellar.

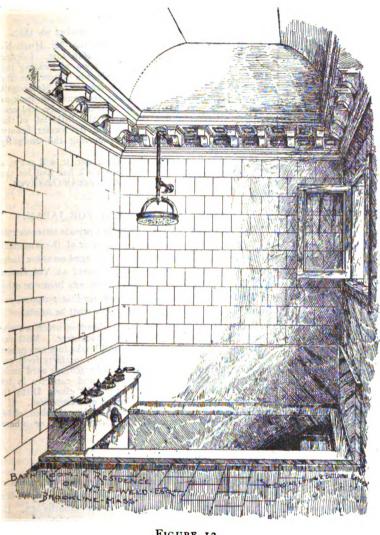

The architect of the building was Mr. Edmund M. Wheelright; the master plumbers were Messrs. Henry Hussey & Co., whose foreman in charge of this work was Mr. W. J. Kelley; the drainage of the house was planned by E. W. Bowditch, C. E., and the sub-soil drainage by Messrs. Aspinwall & Lincoln, all of Boston.

natural gas and sanitary reforms, seems to be fast approaching that condition.

[This is a step in the right direction. Pittsburg is fortunate in having a gentleman in her Common Council intelligent enough in sanitary matters to recognize the fact that a plumbing law is of little avail to protect a community unless provision is made for its enforcement. His influence to secure such action as has here been taken is, therefore, a cause for congratulation.—ED.]

A DOMESTIC BOILER EXPLOSION IN MILWAUKEE.

THE first of the usual series that we are to have this season of water-back and boiler explosions, due to the carelessness in starting a fire when the connections are frozen and the circulations interrupted, occurred last week in Milwaukee. In this case the boiler, which was five feet by twenty-two inches in diameter and of a capacity of 100 gallons, was thrown through four floors of the Kirby House in that city, and out on the roof, injuring several servants and killing one. We suppose these accidents will continue to occur just so long as careless and ignorant people start fires that will generate steam without the fact being ascertained that the pipes and water-backs are free from obstructions.

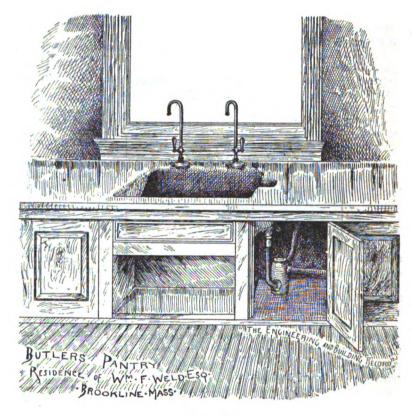

FIGURE 13.

Figure 13 shows the butler's pantry sink. It is made of wood lined with block tin one-eighth of an inch thick, as is also the whole top of the drain-board. It is 10 inches deep by 16 inches wide by 27 inches long and is "burned" together at the corners so as to show no seams, and the standing overflow is arranged and protected within a bay at the right-hand end. The trap and waste-pipe are thus arranged within the closet to the right, as is plainly seen in the illustration through the open door, and do not show beneath the sink; the space thus formed being entirely open and unobstructed. The walls are marble wainscoting; the floor is oak and the wood-work cherry.

The other sinks of the house are all oiled soapstone, except the servants' dining-hall sink, which is ceramic ware. The kitchen sink is 41 inches inside in length by 21 inches wide by 7 inches deep, with 18-inch drain-board of soapstone. The sink in the milk-room is 24x36 inches, with 15-inch drain-board. The cellar sink is 24x30 inches, with 12-inch drain-board, and the ceramic sink in the servants' hall is 26x18 inches.

There are seven water-closets in the building.

The main water-tank is 12 feet long by 4 feet wide by 4 feet high, made of tongued and grooved pine, two inches thick, held together by iron rods at the ends; wooden

A PLUMBING INSPECTOR FOR PITTSBURG.

(From an Occasional Correspondent.

AT a recent meeting of the Pittsburg City Council the question of sanitary methods and reform came up as the business of utmost importance, and, after long and interesting argument in favor of a proper and systematic form of inspection of all sanitary work and plumbing in the buildings of the city, an amendment was offered, passed, and inserted in the code of the city laws, providing for the appointment of a competent inspector at a salary of \$1,500 per year, whose duty it shall be to report violations of the sanitary laws.

Pittsburg is keenly alive to the necessities of reform in this respect, and the remarks of a prominent railway official and a member of her City Council, Mr. S. D. Warmcastle, that "there are more lives lost by imperfect plumbing than by buildings falling down," is quite to the point. Too great praise and credit cannot be given to this gentleman for his advanced and pronounced ideas and his vigorous action in placing Pittsburg on record as worthy of example by many of her larger but less active cities. We need more men like Mr. Warmcastle in this respect, and if Pittsburg's wise Council will supplement the good work by the appointment of a thoroughly competent plumber as inspector, with an advisory board with full powers of arrest and prosecution of violators of her sanitary laws, they will indeed have achieved a victory to be proud of. From the dirttest to the cleanest city in the country seems a great transition, but Pittsburg, with her

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any ofter of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

A SPRAY OR SHOWER ATTACHMENT FOR BATH-TUBS.

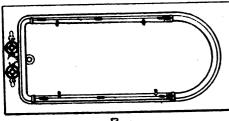

THE subject of the novelty here illustrated is an attachment for bath-tubs, designed to dispense with all exposed cocks or bibbs with their projecting spouts, and to secure a noiseless flushing rim supply in filling the tub, and after the bath has been emptied to act as a flushing device to wash from the tub all the residuum of a bath, by turning on the water for a few moments.

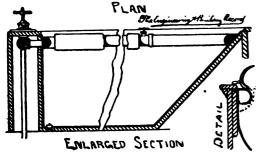

It is designed to remove the chill of porcelain and porcelain-lined iron tubs, making them of the same temperature as the water above the water-level by turning on the hot-water spray. It is claimed that the crazing of glazed

tubs is rendered less liable to occur with hot water thus admitted.

The flushing-rim from the foot to the head of tub is made of a finely perforated pipe, so arranged with a deflecting-hood or shield that when turned down it directs the water to the sides, but when a needle spray or shower is required the shield or hood is turned up, whence the

fine sprays are thrown to their opposite sides, reaching from the centre of tub to within six inches of the top, so that the person at full length is completely showered without the splattering of water over walls and floors, as from the old-fashioned overhead showers.

It is the invention of and patented by Mr. Frank A. Wells, of New York, and manufactured by the Standard Manufacturing Company, of Pittsburg.

AN ECONOMICAL (?) METHOD OF HEATING AND VENTILATING AN OFFICE AND WAREHOUSE BUILDING.

THE following extracts are from a paper presented by Henry I. Snell at the sixteenth meeting of the American Society of Mechanical Engineers, just held at Philadelphia, and termed, "An Economical Method of Heating and Ventilating an Office and Warehouse Building.

The title is very comprehensive, no doubt, but what relation it has to the matter that follows it we are at a loss

If it was entitled "A Method to Warm a Small Storage Building "we would refrain from a comment, but where the question of ventilation comes in or the measure of economy is shown is not apparent.

We have no doubt it is more economical in the matter of fuel than the attempt to warm the same space with grate-fires, but beyond this it proves nothing at all. If the single item of fuel was given and the amount of air circulated the reader might make a digest for himself and determine the economy versus direct radiation or any other style of heating.

Of course, the author cannot mean that the circulation of air from one floor to another makes ventilation. It may be nearly as good as taking fresh air from out of doors in his particular case, but he should remember that every office-room has not a building next to it or above it that it can draw on for its air-supply.

The paper fails to give the information necessary to justify the title adopted. The author says:

"I will describe briefly a method I have had in my store "I will describe briefly a method I have had in my store at Philadelphia, Pa., for the past two winters, which has been very satisfactory. It has been very economical, and dependence could be placed upon its efficiency at all times, no matter what the condition of the weather might be.

An exhaust fan driven direct by a small unright and its property of the state of the same in the same

An exhaust fan driven direct by a small upright engine is connected with a "patent air-heater" placed in the basement at the front of the store by an 18-inch galvan-

An upright boiler in the basement furnishes steam to An upright bolter in the baselinent runtiles steam from the engine is delivered through the exhaust steam from the engine is delivered through the exhaust-pipe into the base of the air-heater on one side, and the drip and condensed steam

is conveyed away through a pipe at the other.

The exhaust steam of the engine furnishes all the heat The exhaust steam of the engine furnishes all the heat usually used, but as a precaution, and for use early in the morning, in extremely cold weather, or for use in very moderate weather, in the middle of the day, when it is unnecessary to run the engine, a small live-steam pipe is connected with the base of the heater. The fan runs at a very low speed, and is perfectly noiseless. In my case, no conducting pipes for the distribution of the air are

necessary, and the variations of temperature in different parts of the store are not observable with the ordinary commercial thermometer. By examining the sketch it commercial thermometer. By examining the sketch it will be seen the store itself becomes one large conductingtube—and the air is used over and over again, enough fresh air coming in through openings around the windows and through doors constantly being open. An opening near the bottom of the heater has been provided, and can be used for supplying fresh air when greater ventilation and less heat are required.

The following data are submitted:

Length of store, 95 feet; width of store, 24 feet; height of basement, 8 feet 6 inches in the clear; height of first or main floor, 13 feet in the clear; height of second floor, 11 feet 6 inches in the clear.*

The side walls are brick, inside walls plastered, and have no openings.

The front is almost wholly of glass, and the large windows are hinged, and open or close like a door. They are not very tight. About three fourths of the wall-surface of the back end is composed of glass, the rest of brick.

The building is five stories and basement, and I only occupy and heat the first and second stories and basement, but I think I could easily heat the whole with my apparatus at a very little increase of cost in fuel

apparatus at a very little increase of cost in fuel.

apparatus at a very little increase of cost in fuel.

The engine that drives the fan is 3 inches in diameter, and has 3 inches stroke. The wheel in the fan is 36 inches diameter, and 13½ inches wide at the outlet of wheel; the area of discharge of blower 1.76 square feet and the inlet is same size. The heater is about 3 feet wide, 6 feet 6 inches high and 20 feet deep, and filled with 588 feet of 1-inch steam-pipe. I am so well satisfied with the results I get from this apparatus that I have not made any close and accurate experiments of what I not made any close and accurate experiments of what I can do with it. I know from the cost of my fuel that the expense of heating all I occupy is about the same as I formerly paid when I only heated the offices which were partitioned from floor to ceiling and heated with open grate. I might return the condensed water from the heater to the boiler and make a great saving. This is

not done at present.

Possibly before the meeting of the society we may have some cold weather, requiring the use of the apparatus, and if this paper produces any discussion by the members, some careful experiments upon its performances may be had before them; but at present I can only give the results of one imperfect and incomplete observation, made during December, when the outside temperature was 45

Temperature of the air on its return and just before entering the heater, 59°.

Temperature of air issuing from the mouth of the blower

Average of temperature of air issuing from the mouth of the blower after passing through the heater, 112°.

Average of temperature of air in the room of the main store, on first floor, 75°.

Pressure of steam in the boiler by gauge, 40 pounds. Revolutions of blower, 113 per minute.

I have made arrangements by which I can measure the evaporation of boiler, condensation by the heater, steam pressure at cylinder, and temperatures at various places pressure at cylinder, and temperatures at various places in the rooms, but to put them in operation I require another element, which I can only obtain later in the season—

viz., cold weather.

I have co apparatus which will give more heat-units than contained in the steam, but I do think I have one which will utilize those obtained to the greatest advantage, and one that will work when I want it to, and as I want it to, independent of atmospheric condition even when the winds blow where they list."

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

MANUFACTURERS OF SEWER-PIPE MACHINERY.

In response to questions from Mr. Burns, of Victoria, B. C., on page 745, issue of November 26, a correspondent sends in the following addresses: Turner, Vaughan & Taylor, Cayuga Falls, O.; J. W. Penfield & Son, Willoughby, O.; O. Barber, Akron, O.; Stevenson & Co., Wellsville, O.

THE BOUND BROOK, N. J., WATER-WORKS. LAMBERTVILLE, N. J., November 24, 1887.

SIR: I notice in your last issue you advise addressing the Commissioners regarding the water-works at Bound Brook. The Commissioners have nothing to do with the matter, save the granting of permission to build, as the matter will be carried along by the Bound Brook Water Company, a corporation which will be organized in a few days, and in which I will hold the controlling interest. We do not propose to contract for any part of the work, but the same will be in charge of a competent engineer, and the work first-class in every particular. I have

* This floor I only heat occasionally, as it is used principally for the storage of machinery. When necessary to heat it I open the damper shown directly over the mouth of the blower, and sufficient heated air will be driven through the opening to heat it comfortably in a

received a batch of letters in response to your notice, the same having been turned over to me by the Commissioners.

Will be glad to give you any information regarding the progress of the work from time to time, should you so desire.

The capital of the company is \$40,000. The company will begin work with \$15,000.

The incorporators are: Sylvanus Ayres, Jr., Torbert Coryell, Lambertville, N. J.; William H. Ayres, Benjamin K. Burke, James M. Thompson, Ransom Lamb, O. B. Reynolds, Bound Brook, N. J.

The water will be taken from Middle Brook. The main pipe will be ten-inch cast iron, and will be 21/2 miles long. The fall will be about 100 feet. The surveys have been made. The dam will be built this winter, and we hope to have the whole thing completed by the 1st of June, 1888.

S. AYRES, JR. Very truly yours,

NEW YORK MUNICIPAL BUILDINGS AND THE CITY HALL.

NEW YORK, November 30, 1887.

SIR: I was much pleased with reading Mr. Hugh N. Camp's remarks in your issue of the 26th inst. I desire to supplement them with the suggestion of locating the proposed buildings on Sou h Washington Square, the city to purchase the block from Thompson to McDougall Streets, a frontage of about 450 feet running back to Third Street. Property in this location can be had reasonably. Carrying out this idea, the little left of the City Hall Park will be saved and its former beauty restored by perhaps, in time, removing the unsightly Court-House.

If the above suggestion is carried out it will prove a monument of the best Mayor New York has had for the past fifty years.

A VETERAN OBSERVER.

DREDGING MACHINERY FOR JAPAN.

THE following is an extract from a private letter written to a gentleman in this city by a member of the American Society of Civil Engineers who is engaged on some large contracts for the Japanese Government at Yokohama. We shall be pleased to forward to him any books or other information that may be sent here for that purpose, and trust some of our readers can supply what he needs.

"There seems to be some work ahead on which we may be able to introduce American machinery. Will you kindly send me such pamphlets and books (not too expensive) relating to deep-sea dredging (up to thirty feet) and river dredging, giving description of machines used under different conditions, cost of plant, and capacity in ten hours in sand, mud. gravel, and light clay. Ditto for steam-excavators. Also number of men employed. If I am not mistaken, there are certain books published, either by the dredging companies or manufacturers, or others, giving just this information."

LONDON CORRESPONDENCE.

CAPTAIN SHAW, the Chief of the Metropolitan Fire Brigade, has made his report on the Exeter Theatre fire, whereby so many lives were lost a few months ago. He reflects very strongly upon the custom which frequently exists, and which existed in the case of the Exeter Theatre, of having shops in the lower portion of the building, where exit doors might most profitably be placed. With regard to the verdict of the Coroner's jury, reflecting upon the architect, Captain Shaw has declined to see the justice of blaming the architect, and has pointed out that the licensing authorities are those distinctly to blame, in that they had licensed the theatre with its existing defects. It is a pity that the custom of putting the blame upon the right shoulders, notwithstanding the influence of the parties, is not more frequently followed out by inspectors and people in authority.

Another instance in which it has been rightly allocated is in connection with the trial for manslaughter of the driver and fireman of the train that was instrumental in the Hexthorpe disaster. The jury acquitted the men on the ground that the railway company was to blame; that the suspension of the "block" system was unjustifiable, and that the signaling was confused and contradictory. The scapegoat principle has not been successful in this case either. No one will feel inclined to doubt that either in the case of the Exeter Theatre or in that of the railway calamity, the architect in the one case and the driver and fireman in the other, distinctly contributed in a very large way, it may be, to the results. While recognizing this fact, however, it is equally palpable that the superiors having the directing power, and failing to apply their power

rightly, were the main contributors to disasters in both

FOR external architectural effects, the late Mr. Street, in the case of Law Courts, is generally admitted to have scored a success. Judging from the continued complaints received of the heating, ventilation, and lighting of the interior, justices' rooms, etc., the success cannot be said to have been more than skin deep. The latest I hear is that in connection with the scheme of drainage, the drainage finds its way into the water-tank from which the boilers, etc., are supplied. This was probably not intentional, but it is unfortunately a fact.

THE work in connection with the long-spoken-of Manchester Ship Canal is at last started.

THE AMERICAN SOCIETY OF CIVIL ENGINEERS.

A MEETING was held at the society's rooms. Wednesday evening, December 8, President William E. Worthen in the chair. A resolution was passed fixing the dues for the proposed new grades for students and associate members, which it was deemed necessary to do at this meeting in order to comply with the constitution. The resolution specifies that in the event of the adoption of the grades of associate member and student the dues for associate members shall be the same as now fixed for associate, and the dues for the student grade shall be ten dollars for resident and six dollars for non-resident students.

The secretary then read the closing discussion on William Metcalf's paper on "Steel, Some of its Properties; its Use in Structures and in Heavy Guns," which was read by the author March 2, 1887. This was followed by a paper giving some experiments on the "Protection of Piles from Limnoria and Teredo in San Francisco Bay," by Marsden Manson, M. Am. Soc. C. E.

The following gentlemen were elected as members: Tucker Carrington Eggleston, Resident Engineer in charge of maintenance of way Richmond and Allegheny R.R., Richmond, Va.; Charles Edward Newham, First Assistant and Locating Engineer Vincennes and New Albany R.R., Vincennes, Ind.; Henry Bowman Seaman, Principal Assistant Engineer with Wilson Bros. & Co., Philadelphia, Pa. As juniors: William Pierson Field. Assistant Supervisor Division A. New York Division Pennsylvania R.R., Newark, N. J.; Robert Van Arsdale Norris, Assistant Engineer Susquehanna Coal Co., Wilkesbarre, Pa.

STEEL FOR STRUCTURES AND HEAVY GUNS. BY WILLIAM METCALF, M. AM. SOC. C. E.*

In closing the discussion on this paper, the author replies as follows to those who have taken part in it:

replies as follows to those who have taken part in it:

"In the effect of slow cooling producing large crystals and weak structure, Mr. Marshall ignores the fact that slow reheating to the right temperature will insure the formation of uniformly minute crystals and great strength, and that, having secured this condition, cooling from the interior, whether rapid or not, will secure initial tension in the direction desired. Here is the true motive power with which to handle large masses of steel, and not steam."

In regard to measuring expansion, he states that "if a steel rod ½ an inch in diameter be heated to a heat that is uncomfortable to the hand, say 120 to 150 degrees. it will

uncomfortable to the hand, say 120 to 150 degrees, it will enlarge its diameter. 004 of an inch. Apply this to a gun ring 2½ inches thick and you would have a change. 02 of an inch in thickness. A summer sun will do this and more for any yn thickness. A summer sun will do this and more for any gun ring; then what becomes of definite shrinkage and elastic limits?

"Steel cannot be welded safely by any known process, unless it be the new electrical method, confirming Mr. Howe's experiment.
"I thought always of continuity."

unless it be the new electrical method, confirming Mr. Howe's experiment.

"I thought always of casting the gun hollow by the Rodman method, but the difficulties of managing the core would be so great that I believe Mr. S. T. Wellman's plan would be wiser—i. e., to cast the block solid, bore out the centre, and then proceed with the treatment. This is no modification of the principle, but it simplifies greatly the whole operation, and removes from my mind the only doubt I ever had about the feasibility of the plan. I believe a large mass of steel can be treated by heat more surely, more cheaply and better than by any known mode of forging; and that by cooling on the Rodman principle a gun can be made to have, with absolute certainty, the tension in exactly the direction, and to the degree that is most desirable."

In reply to Mr. Becker he says: "Use dead soft steel annealed carefully; never without annealing Do not mind the blow-holes, they indicate mild steel; but be very careful to avoid sharp angles and complications of unnecessary ribs. Always study simplicity of form, and fillet thoroughly every corner."

In reply to Mr. Wilson he states: "I do not know of any way to test an eye-bar for over-annealing without

*Read before the American Society of Civil Engineers, March 2,

* Read before the American Society of Civil Engineers, March 2, 1887.

injury to the bar, unless it would be by discovering a greatly reduced elastic limit. Mr. Dorsey first, and myself later, have done a good

work in drawing the Government officers out of their shells. They have proven themselves to be hard-working, painstaking, able gentlemen, genial, courteous, and well-fitted to maintain their position. They have shown us that they have designed and made the best moderate sized steel have designed and made the best moderate sized steel guns in the world, and they have expressed their satisfaction with American steel-makers. From this time out I shall shout: 'Give our Ordnance Corps all the money they need:' and I shall stick quietly to my opinion that the best way to make a big gun is to cast it and treat it by heat slove."

He then refers to Mr. Coffin's discussion of his paper, and states: "Next I offer the theory that hardening is caused by tension; that tempering and annealing are reductions of the tension by heat. If hardening is a mere change of condition of carbon, why should a piece crack when hardened? Let anv person take a round bar of steel of any carbon above. 60 and overheat it just a little, and with perfect unitormity of temperature, and quench it, and it will split up the middle. A bar of any section will do the same, but the round section splits the easiest. Heat relieves the tension and softens the steel. A given temperature relieves a certain amount of tension and no more; therefore, as Mr. Coffin says truly, if the first annealing does not give you softness enough, no He then refers to Mr. Coffin's discussion of his paper. and no more; therefore, as Mr. Comn says truly, it the first annealing does not give you softness enough, no number of repeated heatings of the same temperature will give any greater softness. It is a happy fact. Given, say, a car-spring: it has a certain elacticity, temper, given to it by quenching. It may be frozen to 40 degrees be-low zero and heated to 120 or 130 degrees in the sun, thousands upon thousands of times, yet it retains its ten-sion and carries its load for many years. Consider, too,

it accord with either the 'cement and hardening carbon' it accord with either the 'cement and hardening carbon' theory or the tension theory. Therefore, as I said before, I suspect that the change is effected by the absorption of some gas. To anneal properly, then, heat to the lowest heat that will give the degree of softness required, and allow a short time for the particles to arrange themselves; then cool as slowly as possible, the slower the cooling the greater the softness that is retained. Heat produces the softness slow cooling ratios it.

of these, slow cooling retains it.

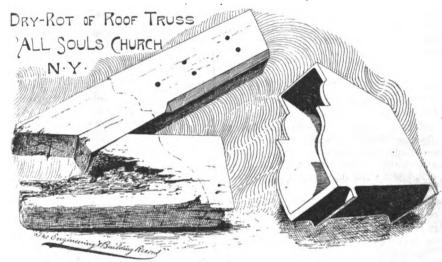

"I have stated that all steel will harden if it contains any carbon at all, and also that even cast-iron will harden and anneal. This statement includes the so-called 'selfhardening' steel. It is easy to anneal the hardest self-hardening steel so that it may be drilled, filed, and cut like any other steel, and then to harden it. The quench-

hardening steel so that it may be drilled, filed, and cut like any other steel, and then to harden it. The quenching medium for 'self-hardening' steel is air. Water or oil will crack it almost every time."

Mr. Theodore Cooper had previously stated that the valuable and instructive 'paper read is one of especial interest. All engineers realize that steel is to be the structural material of the future, and, with a material covering such a wide range of properties, it is absolutely necessary that they should know its characteristics and capabilities. Papers from men who are daily watching and studying its characteristics, noting defective results and searching for the reasons thereof, not proving their conditions by simple laboratory tests, but by the successful attempt of a manufacturing establishment of no mean character, demand careful study and consideration.

DRY ROT IN THE ROOF OF ALL SOULS' CHURCH, NEW YORK.*

THE illustrated description in our issue of October 15 of the case of dry rot in the floors of Holbrook Hall, a

the permanency and exactness of the springs of watches and clocks.

"Experience teaches that, in tool steel at least, we know "Experience teaches that, in tool steel at least, we know of no temperature above that of the atmosphere at the time from which if steel be suddenly quenched it will not show that it is hardened to an amount due to the temperature applied. We cannot recognize any fixed temperature where hardening begins. On the contrary, it is a function of the temperature and has some value for every degree of temperature; also, there is a regular increase of softness for every degree of heat that is addded, until steel becomes liquid

A fracture of steel always indicates the highest temperature to which the steel was last subjected, no matter how it may have been cooled, provided it had not been ham-mered or rolled or otherwise worked mecha..ically.

"Fractures are not alike for the various carbons, but they are so similar that they will soon convince any one that they all obey the same law. It is not to be supposed when we say steel always records its highest temperature, no matter how it may be cooled, that a bar quenched, and another cooled in air, and a third cooled in a bed of warm ashes, from the same temperature, will have the same fractures; they will be different. But a thousand bars, or a million bars, of the same composition, heated to the same degree and cooled in the same way, will have identical fractures." The writer then explains the refining theory by circles of differing diameters, and concludes by stating that "possibly the most important of all is that Fractures are not alike for the various carbons, but they stating that "possibly the most important of all is that the difference in specific gravity is in low steel much less than in high steel; as, for instance, for 40-carbon the difference is only one-fifth of the difference shown in 120 carbon steel. This is the reason that mild steel is not easily ruptured by a high heat; it is also the reason that a mild steel may be rehardened many more times than a high steel without breaking. It shows, too, if the tension theory be correct, that it is difficult to set up a dangerous strain in mild steel, so that engineers need have little fear about using it.

I have known 'dead soft' steel to be over-annealed "I have known 'dead soft' steel to be over-annealed, so that no amount of subsequent annealing and coaxing would make it anything but rotten and worthless. I believe this comes more from soaking heat than quick overheating. I thought at one time that it was caused by a permanent change in the condition of the carbon in the steel—that it became like an excedingly fine cast-iron—but this will not hold, because cast-iron will harden and temper if it does not contain too much silicon. Neither does large apartment-house in this city, has drawn the following from O. P. Hatfield, and the accompanying illustration is from a photograph kindly furnished by him.

Mr. Hatfield says:

"In reference to the decay of the timbers of the roof-trusses of the church corner Fourth Avenue and Twentieth Street, in this city, I send you the accompanying photograph, taken at the time of the restoration, from the ends of the timbers of one of the trusses, showing the decay thereof and also giving a view of the cast-iron shoe which enclosed the end of the truss. The decay is supposed to have been caused by the deprivation of air, consequent upon being confined within the circlett iron when sequent upon being confined within the air-tight iron shoe, preventing the escape of the moisture which generally is discharged at the end of the timbers. The deterioration in this case was rendered the more dangerous from being concealed from view, and was only discovered by the evidences of settlement that finally appeared.

The truss here shown was one of two that supported the central dome of the church. The trusses were all re-

moved without disturbing the roof and new ones substi-tuted. I presume the lesson to be learned from this case is to never deprive the ends of timbers of free access to the air."

THE INTERNATIONAL EXHIBITION AT BRUSSELS.

THIS universal exposition of the products and appliances of science, art, and industry will be held at Brussels during the summer of 1888.

Among the departments in which prizes will be awarded, the following will be of special interest to our readers: Instruments of Precision and Measurement; Heating and Ventilating Apparatus; Designs and Appliances Relating to Civil Engineering and Public Works, and to Architecture and Building Materials; Drawings, Paintings, and Sculptures, Monumental, Architectural, Decorative, and Industrial: Mechanical Tools and Processes: Steam-Engines and other prime motors; Railways and Rolling Stock.

*The church of the late Dr. Bellows (Unitarian).

Applications for space must be filed before January 15, 1888, and entries of proposed exhibits made before April 15, 1888.

Armstrong, Knauer & Co., of 822 Broadway, New York City, are the agents in the United States for the exposition, and should be addressed by those desiring further information.

Gas and Electricity.

Illuminating Power of Gas in New York City.

Week ending	New York	Manhattan	Metropolitan	Mutual	Municipal	Krickerbocker	Equitable
	Gas-Light	Gas-Light	Gas-Light	Gas-Light	Gas-Light	Gas-Light	Gas-Light
	Company.	Company.	Company.	Company	Company.	Company.	Company.
December 3	24.23	19.75	20 78	29.83	27.77	24.20	31.75

THE heat evolved by electric-lighting is, according to Iron of October 14, to be turned to profitable account by a Berlin Electric Company, which has announced that in future it will be prepared to furnish electricity for heating purposes.

WE recently quoted from an exchange that the Duke de Feltre was experimenting, near Havre, with an apparatus to use wind for driving dynamos. We learn from L. Vigreux, in *Le Genie Civil* of October 8, that this inconstant force has been successfully used by the Duke de Feltre, accumulating electric energy, then transporting it with the aid of accumulators to any point to be used for power or lighting purposes.

THE Chronique Industrielle of October 9 contains a description of the electric apparatus of M. Somzee, which has as its object the prevention of collisions at sea. It is based on the well-known theory of using the water, instead of wire, for the transmission of the electric current, and working automatically, it announces the presence of one vessel to another, within a certain electric zone, provided both vessels are equipped with the Somzee apparatus.

THE Revue Industrielle of November 10 gives an account of a recent experiment in signalling at night by electric lights in a balloon. The system is that of M. Bruce, and the experiments were conducted near the city of Anvers. The bulloon was of a diameter of 4m-20. The connecting signal cable contained two copper wires, connected with a battery of 25 accumulators, producing a current of 12 volts and 72 amperes, capable of furnishing six 20-candle-power lamps for 78 hours. The signalling is done from the ground-no one being in the balloon-by means of a Morse instrument. When the circuit is closed the current is sent through the lamps. By short or long intervals of opening and closing the circuit it was found that the Morse telegraphic cipher could be easily reproduced. The first trials were made with the lamps distributed in a circle in the interior of the balloon. subsequently the six were grouped together and hung under the balloon. In both cases the signals were understood at a distance of 3,000m. The balloon only rose about 100m.

La Lumière Électrique of November 12 states that photometric comparisons of incandescent lamps were recently made at Antwerp to establish the following four points: First, the mean horizontal intensity of the light; second, the relative intensity under different angles; third, the mean spherical intensity: fourth, the variations in the luminous intensity with varying electromotive force and strength of current. The means for determining these qualities necessitated elaborate apparatus. The experiments demonstrated the mean horizontal intensity to be .919 for a given lamp, while the mean intensity at 45° or transversely was .915. The relative intensities of angular rays were ascertained and graphically illustrated by curves. The mean spherical intensity was found to be .8 that of the horizontal intensity. The variations of luminosity due to varying electromotive force and current strength were different for each special kind of lamp, but a definite formula was deduced and confirmed the experimental results mathematically.

THE Red Cross Society has offered a prize of 6,000 marks (\$1,400) for the best design for a portable hospital.

THE NICARAGUA CANAL EXPEDITION.

This expedition, which sailed gallantly out of New York harbor on November 30, marks an important step in an enterprise most important to this country and to the civilized world, and it derived additional consequence from the admission just made by De Lesseps that, for the present at least, he had abandoned the idea of a sea-level canal at Panama.

This deprives the Panama route of what is generally regarded as its sole advantage and will doubtless give an impetus to the Nicaragua scheme.

The citizens of this country certainly hold at Nicaragua and Tehuantepec two of the most important gates of interoceanic communication on this hemisphere, and it will be interesting to see which gate shall be opened first.

It will be remembered that four years ago the Tehuantepec route was carefully surveyed and a very satisfactory line located; sufficient grading was also done to comply with the terms of the concession, and while the untimely death of its great projector was a serious blow to the enterprise, the concession is valuable and the route advantageous, so that the project is not likely to be easily abandoned.

PROGRESS IN CAR-HEATING FROM LOCOMOTIVE.

FIGHTY passenger coaches on twenty-two local trains of the New York Central and Hudson River Railroad have been furnished with appliances by which they can be heated directly from the locomotive. These trains are between Buffalo, Lockport and Niagara Falls, and between New York and Croton, and also on the Buffalo Belt line.

Last Wednesday a special "vestibule" train was run from New York to Albany and back to exhibit to an invited party of railroad men and members of the press the new cars for the New York and Chicago limited trains, of which fifty-five are now building by the Wagner Company for the Vanderbilt lines. These cars are warmed by the hot-water circulating system of the Safety Car Heating and Lighting Company, which seemed to work very satisfactorily, although the weather was not cold enough to afford much of a test.

The Chicago, Milwaukee and St. Paul Railroad, having experimented with car-heating from locomotive with sat-factory results, will at once adopt the system for all through trains on its various lines.

A DRAFT KILLER.

Uhlands Wochenschrift states that the Carbonate of Soda Company, of Dresden, produce an apparatus designated as a zugtödter (draft-killer) which will prevent cold drafts of air at windows. The apparatus consists of an ornamental box fitted to go between the sashes of double windows. The box has openings and valves and contains a carbonate of soda preparation which is odorless and smokeless, and which absorbs the air that leaks in between the sashes from within the room and from without. The effect is to create a constant uniform temperature between the sashes of the double windows.

The apparatus is constructed on the principles established by Dr. Krücke, of Berlin. The German Society of Physicians has highly commended the zugtödter.

We learn from the Osterr Ingenieur und Architekten-Vereins weekly edition of November II that the Russian Government is about to send a "technical engineer" to the United States who will be permanently attached to the Russian Embassy. This is to be followed by similar appointments to all their foreign legations. We agree with our contemporary that this is an important move in the right direction, and should be followed by all governments. The duties of this engineer will be to announce at the earliest moment, to the home government, all important scientific and technical discoveries and enterprises. It is gratifying that the United States should have been selected for the first appointment.

THE newest thing in bearings for axle-boxes is vegetable parchment sheets on edge. Experiments are being made with such boxes in Germany, and they are reported to work very satisfactorily, perhaps partly owing to the fact that their construction allows the bearings to be thoroughly lubricated.

JAMES CARSON BREVOORT.

JAMES CARSON BREVOORT died December 7 at his residence in Brooklyn, N. Y. Born in New York City in 1818, he graduated from the Ecole Centrale des Arts et Manufactures, in Paris, as a civil engineer, and before returning to this country made a tour of the manufactur ing districts of England and studied carefully that country's system of railroad construction. During 1838 he was engaged at the West Point foundry, and in 1841 assisted as surveyor on the North-western boundary survey. The year following he accompanied Washington Irving, United States Minister to Spain, as private secretary and attache of legation. In 1845 he married a daughter of Judge Leffert Lefferts and settled in Brooklyn, where he has since resided. In 1847 he was a member of the Charter Commission, and later served on the Brooklyn Board of Education and as a member of the Constructing Board of Water Commissioners. In 1852 he was elected a trustee of the Astor Library, and served for twenty-six years subsequently, during the last two years as superintendent of the library. He assisted in 1863 in the formation of the Long Island Historical Society, of which he was the first president, holding the office for ten years. In the same year he was made a Regent of the University of New York and received the degree of Doctor of Laws from Williams College. He was a member of many learned societies, and ot literary as well as scientific tastes. He leaves a widow and one

GENERAL WILLIAM HEMSLEY EMORY.

BRIGADIER-GENERAL WILLIAM HEMSLEY EMORY, who retired from active military service in 1876, died at his residence in Washington December 1. He was born at Poplar Grove, Md., and graduated at West Point in 1831 with such high honors as to forthwith receive promotion as Brevet Second Lieutenant of the Fourth Attillery. Two years later he resigned, and after devoting himself to civil engineering the two ensuing years was reappointed First Lieutenant of Topographical Engineers. He was diligently engaged, until the breaking out of the Mexican war, in surveys on coast fortifications and in running the boundary between the United States and the British Provinces. He was Acting Assistant Adjutant-General of Kearny's expedition to California. He was brevetted Captain for brave and gallant services at the battle of San Pasquale, and Major for meritorious conduct in the battles of San Gabriel and Plains of Mesa. He was promoted Lieutenant-Colonel for his services in running the boundary line between the United States and Mexico. His notes on the military reconnoissance of the Arkansas and Gila Rivers and New Mexico and California show that he possessed no ordinary talent as a surveyor and scholar.

In 1855 he was appointed Major of the Second Cavalry and transferred to the First Cavalry, and until the breaking out of the rebellion was employed in frontier duty.

When the rebellion came he was on the Texas line, and a Confederate delegation requested him to follow the traitorous example of General Twiggs and surrender the command. "I will surrender only when I am whipped. The Confederates will have to do that before 1 surrender. Though a Southerner, I am no traitor. If you take me it will be as a prisoner, not as an ally." Such was his reply. Then with the troops at Forts Cobb, Smith, Washita, and Arbuckle, which he concentrated, he captured the advance guard of the rebel forces, and safely retreated to Fort Leavenworth, Kan. His prisoners were the first taken in the war, and his arrival at the post undoubtedly saved it and the State of Missouri.

In 1861 he was appointed a Lieutenant-Colonel of the Sixth Cavalry. In 1862 he was made Brigadier-General of Volunteers and took part in the Virginia-Pennsylvania campaign with McClellan. He was placed in command of New Orleans at a most critical time, and twice repulsed the notorious Dick Taylor at La Fourche Crossing. In 1863 he was in command of the Nineteenth Army Corps in the Red River campaign. In 1865 he was brevetted Major-General for services at Cedar Creek. He lived in Washington after his retirement, and leaves a widow, two daughters, and one son.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITIONS.

OSHKOSH, WIS.—Plans and architects' estimates for a new public school building for the city of Oshkosh will be received for examination and consideration by the Board of Education until December 15. For information address C. W. Bowron, Chairman Building Committee.

For works for which proposals are requested see also the "Proposal Column," pages i-iii-viii-31.

Persons who make any use of the information they find in these columns we trust will not omit to mention The Engineering & Building Record as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and rel able news for our "Contract in Intelligence." Information of importance sent to us exclusively, and not eisewhere published, will be liberally paid for.

WATER. SEWERAGE, ETC.

PASADENA, CAL.—The Mountain View Water Co., of Pasadena, has been incorporated. Capital stock, \$8,750. E. H. Royce can give information.

MARION, IOWA.—The Marion Water Co. has been incorporated. Capital stock, \$175,000. B. F. Seaton can give information.

PORTSMOUTH, VA.—Water-works will be in operation here soon.

SANFORD, FLA.—The water-works are to be improved.

GREENSBORO, N. C.—The proposition of Mr. Keogh to build water-works has been accepted.

FAIRCHANCE, PA.—The Fairchance Water Co. has been incorporated. Capital stock, \$5,000. William McCane, and others, incorporators.

PINE BLUFF, ARK.—A water-power company has been incorporated with a capital stock of \$150,000.

PORT PERRY, PA.— The Turtle Creek Valley Water Company has been formed to pipe the boroughs of Braddock and Port Perry, and the townships of Wilkins, Patton, and North Versailles. A pumping-station will be erected on the Monongahela River, near here.

NORTH BERWICK, ME.—This place is taking up a system of water-works.

ELLENTOWN, PA.—A stand-pipe 76 feet high will be erected here.

LITTLE CHUTE, WIS.—It is reported that water works are to be established here.

CONCORDIA, KAN.—It is expected that a system of water-works will be planted at Concordia before June, 1888.

BONHAM, TEX.—Our correspondent writes: "On the 21st inst. the City Council resolved to issue bonds for \$60,000, for the purpose of constructing water-works, and a committee was appointed to advertise for proposals to bore artesian wells and to negotiate for the placing of the bonds."

FOSTORIA, O.—Our correspondent writes: "The ordinance granting to Ferris & Halladay franchise to construct water-works was ratified by special election held on November 25, said firm to file an acceptance within thirty days."

FORT SMITH, ARK.—Our correspondent writes: "This city contemplates putting in a complete system of sewerage all over the city. The steps so far taken are: Mr. J. W. Neir, of Kansas City, was employed to recommend a plan and get up plans and specifications; these are now completed. As I understand it, it is the separate system, except as to some parts; main sewer for instance, which is brick, 3 feet 9 inches diameter. The City Council will now appoint three commissioners who will take charge of the work. They will first ascertain the entire cost, upon which the City Council will levy a tax sufficient to cover the amount.

This levy remains a lien upon all the real property of the entire city until it is paid. The Commissioners have the authority under the law to borrow ninety per cent of the entire levy and pay as high as ten per cent. interest. The wish and intention is to have it all laid and completed before the hot weather of next summer sets in."

CLARKSBURG, W. VA.—Our correspondent writes: "The supply will be taken from the West Fork of the Monongahela River, either through infiltration wells or galleries, and pumped into two steel tanks, each of 282,000 gallons capacity, located on one of the adjacent hills. The pumping machinery will consist of two duplex pumps of 500,000 gallons capacity each. There will be about 6.5 miles of pipe, ranging from 10 to 4 inches in diameter, of which 1.2 is 10 inches, force main from pumphouse to tanks. About thirty-one stop-valves from 10 to 4 inches; fifty-one 6 and 4 inch hydrants will be required. Plans and estimates are now being prepared by Mr. John W. Hill, Consulting Engineer, Cincinnati, O."

ITHACA, MICH.—Our correspondent writes: "There has been nothing done in regard to water-works as yet. There has been a committee appointed to investigate and see if a supply of water can be had, and if they are successful in finding plenty of water the village will undoubtedly put in a system of waterworks."

READING, PA.—Our correspondent writes: "We are at present looking out for some good reliable source to enlarge water-works, but as yet nothing decisive has been done, although something must be done this winter."

SAN BERNARDINO, CAL.—Our correspondent writes: "The steps taken by this city to establish water-works are that this city has granted a franchise to the Alta Water Company to pipe water into the city. The Water Company, I understand, to be now engaged building a reservoir preparatory to connecting their pipes with it,"

WEST SUPERIOR, WIS.—Answering an inquiry concerning water-works matters here, our correspondent writes: "We have about one mile of main laid; will suspend operations until spring; will lay about four miles of main then and about five miles of supply-pipe,"

CHATHAM, QUEBEC.—In answer to an inquiry concerning water-works here, our correspondent writes as follows: "No steps have yet been taken to establish water-works; those in favor are still agitating the matter. The Council of 1888 may look more favorably on the move. The new council goes in about Jacuary 15."

FULTON, Mo.—The special election held here November 29 resulted in favor of establishing water-works, and \$8,000 will be appropriated for that purpose. The sinking of an artesian well will be the first move made by the authorities.

LANSDALE, PA.—A sewerage system will be established here in the spring.

WAUKESHA, WIS.—An artesian well is to be bored here to secure a supply of water for the water-works system.

MINNEAPOLIS, MINN.—The question of enlarging the water-works continues to be discussed by the city officials. John A. Coley, the consulting engineer of the Water Department, has presented his report on the result of his recent investigation, and it is probable that steps toward the proposed improvement will soon be taken.

Dover, N. H.—At a recent special election the citizens of Dover voted to adopt the act passed recently by the legislature authorizing the purchase of the three aqueduct companies here and constructing new waterworks. The construction of the water-works will begin in the spring.

BROOKLINE, MASS.—At a recent meeting of the Common Council it was decided to ask the legislature for permission to appropriate \$500,000 for increasing the size and capacity of the water-works.

DES MOINES, IOWA.—The City Water Company has been incorporated with a capital of \$300,000. R. E. Hurley, J. W. McCabe, and others are the incorporators.

GRAND RAPIDS, MICH.—Our correspondent writes: "Proposition to bond the city for \$250,000 for water works improvements was defeated December 6. It is not known what further steps may be taken in regard to the matter."

SOUTH GRAND RAPIDS, MICH.—Our correspondent writes: "No definite plan has been formulated and made public at least for waterworks for South Grand Rapids. I think it is only a scheme announced to 'boom' this section of the city for speculative purposes."

JEFFERSON CITY.—It is reported that waterworks are to be established here. Mr. Perkins is said to be at the head of the project.

ALLEGHENY, PA.—The water committee has been ordered to take up the matter of a better supply of water for the city and will meet every Monday evening to discuss the question until some conclusion can be arrived at

CENTRALIA, ILL.—The special committee of the City Council appointed on water-works has made its report to the City Council. The committee was continued, and instructed to ask for bids for water works on the franchise plan. The adoption of the plans and their final adoption is to be left to a vote of the people.

SANDUSKY, O.—Our correspondent writes: "The Board of Water-Works will at once advertise for a new pumping engine of at least 5,000,000 gallons capacity daily. Charles A. Judson, City Engineer, can give details."

PAWTUCKET, R. I.—The sum of \$150.000 has been appropriated for a new pumping-engine at the water-works. Edward Darling is water works superintendent.

SANDUSKY, O.—This city will vote upon a proposition to issue \$32,000 in bonds for a new pumping-engine for the water-works at an early date.

HERRINGTON, KAN.—A water-works company has been established here and a system is to be built.

WAXAHACHIE, TEX.—Water-works are to be established here.

MINNEAPOLIS, MINN.—Holly pumps have been ordered put in at the Diamond Station.

FRESNO, CAL.—Bonds in the sum of \$100,000 are to be issued for a complete sew-erage system.

KEY WEST, FLA.—The Mayor of this city can give information concerning a proposed system of sewerage.

GLENDALE, O.—A system of water-works is to be established here.

STAFFORD SPRINGS, CONN.—A system of sewerage will soon be built here.

Weatherford, Tex.—A company has been organized to establish water-works here.

MISSOURI VALLEY, IOWA.—This town is to expend \$25,000 in a system of waterworks.

WILLIAMSTOWN, N. Y.—J. M. Waterman is at the head of a scheme to establish waterworks here.

Kentland, Ind.—It is reported that a large sum of money is to be invested in waterworks to be erected here.

WINFIELD, KAN.— The City Engineer has finished plans for a sewerage system, which is to cost the city \$190,000.

ATHENS, TENN.—Water works are to be built here soon.

ST. PAUL, MINN.—At a recent meeting of the Water Board it was decided to lay mains to Merriam Park for the purpose of supplying that place with water. The improvement will cost about \$89,000 and operations are to begin soon.

QUINCY, ILL.—It is probable that there will be some sewer construction here soon.

THE St. Cloud Water-Works Company, with a capital stock of \$150,000. The time of commencement has been set for December. Ic, and will continue thirty years. The incorporators are: E. D. Brown, H. W. Phelps, and others, all of Minneapolis.

DAYTON, KY.—Important developments in water-works matters may be expected here soon. The officials have decided for water-works and favor the "Mercer System," but nothing can be done until an act has passed the legislature allowing the town to contract for water.

ARCOLA, MASS.—This place is to have water-works, consisting of a huge tank placed on the top of a tower, and the water pumped in by a windmill from a reservoir.

TOPEKA, KAN.—The City Council has passed an ordinance authorizing the issuance of \$150,000 in bonds to purchase water power for the use of the city, and providing for a special election December 29.

WILLIAMSPORT, PA.—Our correspondent writes: "A general system of sewerage for the entire city is now receiving attention, and we hope to be able to let the work in the spring for the second and third districts. Estimated cost of same, \$115,000; to be paid for by property owners per foot front."

WINCHENDON, MASS.—Our correspondent writes: "A committee has been chosen to investigate the subject of water-supply and report at the annual towa meeting in March 1888."

Orono, Me.—Our correspondent writes:
"Water-works company organized under charter granted by Legislature. Title, "Orono Water Co.": D. N. Mayo. President; B. E. Donigan. Secretary; A. J. Durgin, Treasurer; and a Board of Directors. Committee appointed to confer with other companies as to the feasibility, and report at a subsequent meeting."

HAYWARD, Wis.—People of this place proposed to erect a system of water-works at the expense of the entire township, but an injunction restraining the village from prosecuting the work has been issued.

McKeesport, Pa. — The McKeesport Water Committee has awarded to the Worthington Steam Pump Company, of New York, the contract to erect a pumping-engine at a cost of \$19,500.

WINDSOR LOCKS, CONN.—In answer to an inquiry concerning the water-works project here, our corresponpent writes as follows: "We held a meeting and estimates were made as regards the cost of construction, and the success of the undertaking was almost fully assured. H. C. Douglas and E. D. Cougan were appointed a committee to locate the point at which water would be taken, and also determine the elevation. The works will probably be done by the company, or, if satisfactory arrangements can be made, with outside parties. We find we have sufficient elevation to give us all the water the town wants (by gravitation), without pumping. The incorporators are C. E. Chaffer, E. B. Bailey, H. C. Douglas, E. D. Cougan, S. B. Douglass, J. T. Coogan, A. W. Coursen, and J. W. Johnson.

ALLEGHENY, PA.—The water-works commissioners are discussing the question of placing new pumping machinery at their works.

FORT SMITH, ARK.—It is probable that an early conclusion will be reached in the matter of a system of sewerage for this city. Mr. Nier, at hydraulic and sanitary engineer of Kansas City, has perfected a detailed plan of the projected system upon which it is expected the city officials will take conclusive action within a week. It is reported that the system proposed will cost \$130,000.

LANCASTER, PA.—Our correspondent writes: "We are now building new water-works according to plans furnished by J. J. R. Croes, C. E., of New York City, putting in Worthington pumps, and four Babcock & Wilcox 100 horse-power boilers, raising the water about 170 feet to our present reservoir, at a distance of about one mile, through 3-foot pipes."

Owosso, MICH.—Our correspondent writes concerning water-works here: "The city has voted to bond itself for the purpose of putting in water-works. The Council has appointed a committee recently to look after carrying out the intent of said vote, and this is as far as we have proceded yet. I expect measures will be ripe for operations in the spring."

JAMFSTOWN, N. Y .- At a meeting of the Jamestown Water-Supply Company the report of Engineer Charles B. Brush was adopted to govern the actions of the company in building its new Levant system. The president was authorized to let the contract for building was suthorized to let the contract for building a pumping-station, the plan of which is at present being considered by Engineer Brush. The building will contain two 100 horse-power steel boilers, and a compound condensing pump capable of pumping and distributing 2,000,000 gallons of water daily. The tank or reservoir, which will be located on the highest ground in the city is to be 30 feet in diameter and high enough to contain 100,000 gallons, The supplies necessary for additional mains, etc., will consist of 1,600 tons of iron pipe, 25 tons of lead, and one ton of Russian hemp

CLEVELAND, O.—At a recent meeting of the Water-Works Trustees, Superintendent Whitelaw was instructed to immediately prepare plans and specifications for the new lake tunnel. The tunnel will be 30 feet below the bottom of the lake, 7 feet in diameter, and will cost about \$300,000. It will take nearly two years to complete the undertaking. two years to complete the undertaking.

THE REPAVING REQUIREMENTS OF NEW YORK CITY.

On another page will be found a brief report of the preliminary meeting of the Committee appointed by the New York Chamber of Commerce to confer with the authorities of that city to ascertain in what direction they can best co-operate to secure the repavement of its business portion. The disabilities under which the authorities now labor will doubtless be plainly brought out by this public action of the Chamber of Commerce. It is a hopeful sign that this influential body proposes to interest itself in a movement to put an end to the disgraceful condition of the streets of New York, and it is highly important that there should be concerted, intelligent action on the part of all good citizens, except the directors of surface railroads and corporations who are constantly disturbing the streets without any regard to the convenience of the community and the pockets of taxpayers, and who hitherto have never failed to look out for their immediate interests, as has been frequently pointed out in these columns. Four things will have to be decided upon, and until they are done it seems useless to spend any money for new pavements. First.—The present form of street-rail should be abolished, and not another length of it should be permitted to be laid. Second.—Paving of every portion of a street should be done by the city authorities, or under their direction and control. Third.—No openings should be made in the pavements except under permits granted by the Commissioner of Public Works, which permits should state definitely the exact location and limits both of time and space within which the opening can be made. Fourth.—All restorations should be made by the Department of Public Works or under its immediate direction, the cost of which should be paid by the corporation or individual for whom the pavement was originally disturbed. This latter requirement is universal in every city in Europe that pretends to have a pavement worthy of the name. Without it responsibility cannot be placed on any one, nor is it possible to secure by present methods anything but the most worthless and inefficient work. been pointed out in the series of articles on "Pavements and Street Railroads," now appearing in The Engineering and Building RECORD, the custom abroad is to have corporations, like gas or water companies, who have occasion to frequently disturb the streets, leave a regular deposit with the department. Against this deposit charges are made for each piece of paving done at a fixed price per yard, according to the kind of pavement. Where special openings are made special deposits are required. The department in charge of streets, when it issues a permit for an opening, requires the space to be enclosed by means of iron pins and a rope, from which lanterns are suspended at night, and if it is a street which has a concrete foundation under the pavement, time is taken to allow the concrete to properly set be-fore the pavement is relaid. When the necessary authority is given to the proper officials to institute and maintain the reforms here outlined, pavements suited to a civilized community may be secured and retained. To that end it is to be hoped the influence and co-operation of the

Chamber of Commerce may be effectual.

EVERY MAN HIS OWN BRAKEMAN.

THE Revue Industrielle of November 10 describes a new air-brake for railroad trains, recently tested on the Eastern Railway. The idea is to give every passenger a chance to stop the train, and this is done by placing a handle in each compartment, which, when drawn out, puts on the brakes automatically. At the same time two little white disks appear, one on each side of the car, which enables the train-hands to know from what compartment the train was stopped.

This will be a great convenience for passengers who may have dropped something out of the window or wish to get off between stations or to stop awhile to enjoy the view, but as regards the other passengers, who may be in a hurry to get somewhere, it certainly has disadvantages for which even the appearance of "the little white disks" offers no adequate compensation, unless, indeed, they wish to be guided thereby to the compartment of the amateur brakeman and are satisfied "take it out of his hide."

Our Western "knights of the (rail) road" will hail the invention with delight. A convenient confederate in a compartment would relieve them of much trouble in stopping a train, and they in turn could relieve the passengers of many other things.

We believe the suggestion of using the American bell-cord, enabling any passenger to stop the train by signal to the engineer, gave a thrill of horror to English railway authorities, and when at last convinced of the importance of doing something of the kind, they covered the signalling apparatus with a plate of glass surmounted by a recital of divers pains and penalties to be inflicted if broken except in certain prescribed emergencies. The French, in proposing to let any passenger be his own brakeman, seem to have gone to the opposite extreme.

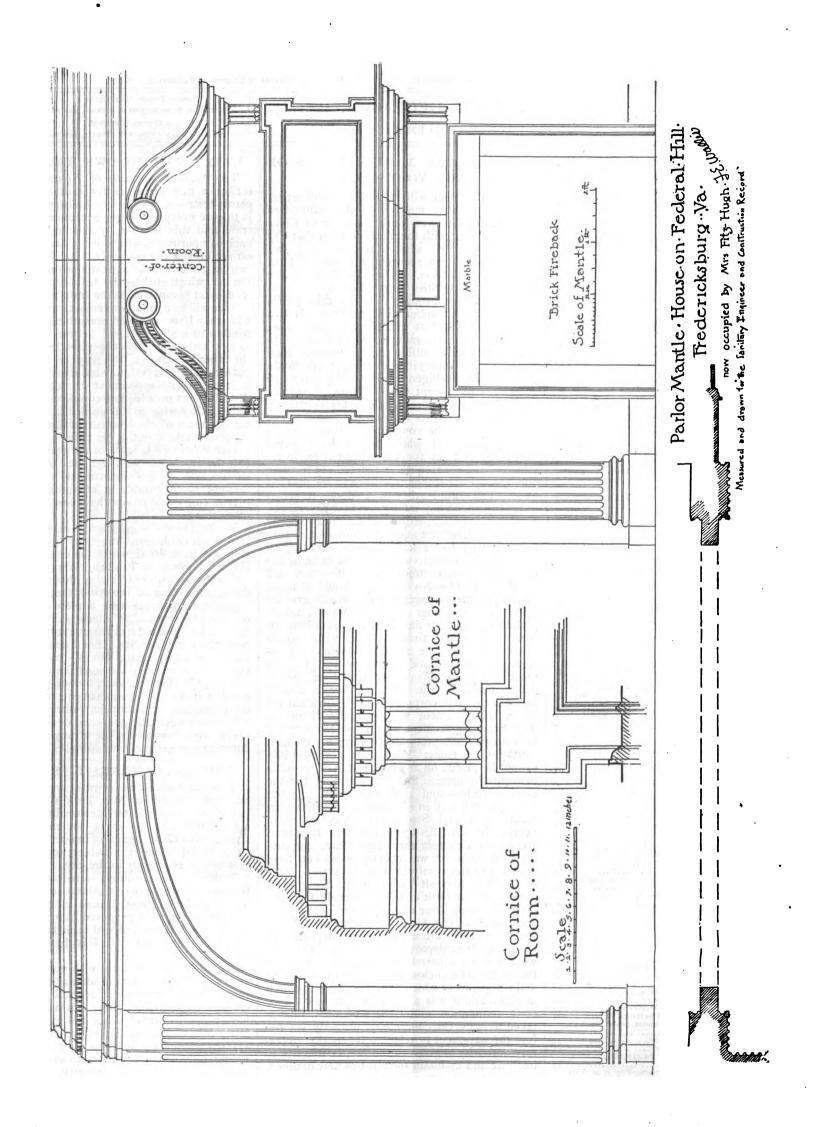

Except in case of assault by one passenger on another in a closed compartment, unhappily not too infrequent on European railways, it is difficult to see when the proposed device would be useful, and, fortunately, the arrangement of our American passenger cars obviates that danger.

THE RAPID TRANSIT PROBLEM.

THE letter which we print in another column on rapid transit in New York City, over the nom de plume of "Inter-Metropolitan," is from a gentleman who has given the matter careful study, and will be found of much interest and value to all whom the subject concerns, and that means everybody in the city.

While we have always advocated viaducts through blocks between streets as by far the better mode of rapid transit in cities, we are glad to welcome the proposed Elm Street tunnel, or any other method of real rapid transit, on the principle that "half a loaf is better than no

We are inclined to agree with our correspondent that a mixed system of alternate viaduct and tunnel might offer great advantages, both in construction and operation; but while he would have it mainly tunnel, using the viaduct only at low places like Canal Street, we would use the viaduct wherever practicable, and resort to tunneling only where necessary to avoid excessive grades or very valuable property, or to connect with some underground system. This suggests the general problem of the best method of connecting with other systems, which must be reserved for more mature consideration.

THE MEDAL COMPETITION FOR A CLOCK-TOWER DESIGN.

THE jury, consisting of Messrs. Richard M. Hunt, Charles F. McKim, Russel Sturgis, John Du Fais, Charles I. Berg, and William C. Hazlett, considered the drawings submitted in competition for the gold and silver medals of the Architectural League on the afternoon of the 12th, all being present.

Forty-four designs were submitted. It was found necessary to throw out one design for non-compliance with the conditions of the problem, leaving forty-three for consideration. The jury proceeded to their choice by a method of elimination, or the "survival of the fittest," and at the conclusion found themselves unanimous for first choice.

The names of the successful competitors will be announced at the reception on the evening of the 17th.

From a cursory examination of the designs it appears that few grasped the exact scope and limitations of the problem, which was a "Memorial Clock and Bell Tower on a Village Green," as a large majority of the designs are of such a monumental and costly character as to be entirely unsuited to the rural surroundings of the site.

All the drawings will be at the exhibition during the three weeks of its continuance.

THE ST. LOUIS WATER-WORKS.

THE St. Louis Globe Democrat has, on December 11, followed its account of the gas-works, which we mentioned in our last issue, by a quite fully illustrated article on the water-works of St. Louis, tracing their growth from the primitive water-carrier, with his two buckets slung from a yoke, to the present arrangement of pumping-engines, stand-pipes, and reservoirs.

If the article should be the means of bringing the good people of St. Louis to a realizing sense of how much it costs to get a good supply of water, and thereby make them more careful to avoid its waste, it will have rendered them a most valuable service and taught a lesson much needed by a majority of the water-users of this country

This lesson will be especially timely at St. Louis just now, as the city has much outgrown its water-supply, and, under pressure of increasing need, the Municipal Assembly last summer, on the recommendation of Mayor Francis, resolved to carry out the plans for a low-service pumpingstation and reservoirs at the Chain of Rocks, as proposed by the late James P. Kirkwood in 1865, and again by Thomas J. Whitman in 1885.

The Globe-Democrat has fallen into a slight error in calling its Grand Avenue stand-pipe the highest on the continent. . The height of the Grand Avenue stand-pipe proper is 160 feet, and its diameter 5 feet, giving a capacity of 23,500 gallons, while the stand-pipe at Sandusky, O., built about ten years ago and described in our columns on the 12th of February last, is 180 feet high and 25 feet in diameter, with a capacity of 661,700 gallons.

FIRE-PROOF CONSTRUCTION IN THE NEW STEVENS INSTITUTE BUILDING.

In the new building of the Stevens Institute for use of the High School it has been decided to adopt what is known as the "slow-burning mill system of construction," which is, in fact, even preferred by some insurance companies to iron construction. It will make the building as nearly fire-proof as it can be made with wood, there being no hollow places in partitions and floors for fire to lurk concealed. The floors will accordingly consist of heavy yellow pine girders placed at intervals of from seven to nine feet apart; on these will be laid a rough flooring of 3-inch tongued and grooved planking; a layer of water-proof sheathing paper is laid over this, and the whole is covered with one inch of lime and sand mortar; over this and on to nailing cleats will be nailed the tongued and grooved yellow-pine floor. This mode of construction, aside from its safety, has the further advantage of giving a deadened floor—a decided merit in a building for such a purpose. The ceildecided merit in a building for such a purpose. The ceilings and girders underneath are plastered close to the wood. The wooden partitions, except those in the classrooms, are to be made of 3-inch tongued and grooved plank, stripped and plastered on both sides, close to the wood. The stairways will be built on the same principle of slow-burning construction. Messrs. Wilson Bros. & Co., architects, of Philadelphia, designed the building, and are superintending its erection. Mr. John Decker, of Philadelphia, is the general contractor. The building will probably be completed before Christmas. OUR ARCHITECTURAL ILLUSTRATIONS.

THE NEW YORK CITY HALL.

A WRITER to the New York Evening Post asks:

' Are the authorities aware that there are thousands of people who regard the old City Hall as far and away, without exception, the most architecturally successful and altoout exception, the most architecturally successful and antogether beautiful structure in these whole United States?

"That they may be prevented from altering it or adding to it, except perhaps in height (and that with great discretion), is the anxious hope of many

CITIZENS."

[It is better not to tamper with it.]

NEW PAVEMENTS FOR NEW YORK.

THE committee appointed by the New York Chamber of Commerce to confer with Mayor Hewitt and General Newton as to what steps could be taken in order to best co-operate with the authorities in securing new pavements for the business portion of this city, met by appointment in the Mayor's office on December 9. The committee consisted of Messrs, Francis B. Thurber, Secretary George Wilson, Silas B. Dutcher, James H. Seymour, Thomas Rutter, and Henry C. Meyer. General Newton, Commissioner of Public Works, presented a statement prepared by one of his staff who had made a survey of the down-town streets, which indicated that 536,527 square yards of street surface required repaving at an estimated cost of about two millions of dollars. Mayor Hewitt expressed himself as in favor of authorizing a loan of about five millions to be expended by the Commissioner of Public Works, subject to the approval of the Board of Estimate and Apportionment, for repaving the streets of this city, provided authority were given the Department of Public Works to compel railroad and other corporations to obey its order with regard to the opening of streets and the obstruction of them by needless street rails, put down by railroad companies to hold a charter, but on which they never ran cars. The Mayor cited the aggravated case of the corporation who have rails in Fulton Street. The impossibility of properly doing anything until the authorities had power to control the action of corporations who get grants from the Legislature or Aldermen, and consequently ignored the authorities, was made manifest. A member of the committee urged that all pavements when opened by corporations or other parties should be restored by the department's own servants, the cost of such restoration to be paid by the parties having the streets opened, the amount of space to open at one time, duration of time of such opening, where traffic should be suspended, should also be subject to the discretion of the Commissioner of Public Works. On this point the Mayor said that the Corporation Counsel would be asked to see if further legislation was necessary to give such power to the Commissioner. Pending the securing of the needed legislation suggested, the Commissioner of Public Works proposed to submit a list of the streets that most imperatively needed pavement to the members of the committee, and expressed himself as desirous of expending the \$500,000 appropriated by the Board of Estimate and Apportionment on such streets as the committee should agree most needed it. After assuring the Mayor and the Commissioner that the Chamber of Commerce would heartily co-operate with them in a movement to secure better pavements for this city, the meeting adjourned for further conference when the data promised by General Newton should be prepared.

THE NEW YORK ARCHITECTURAL EXHI-BITION.

THE anticipated interest in the exhibition of the League this year has secured quite an extended notice in a recent issue of the New York Evening Post, the following abstract of which will no doubt interest many of our

readers:

"The projected exhibition of the Architectural League at the Fifth Avenue Galleries has now grown far beyond the original ideas of the association. Hitherto the League has made its exhibition as a sort of side show to the display of the Salmagundi Club, but as the latter resolved not to have any exhibition this year the architects determined to launch out by themselves. Upon inquiring into their resources they were found to be so ample that the League determined to engage the new galleries of Messrs. Ortgies & Co., which can furnish 5,000 square feet of wall-space, and to open their doors to the public from December 19 to January 7. The objects exhibited were

to be architectural designs, perspective drawings, sketches in pen and ink, water-colors, fusain and charcoal, elevations, working drawings, paintings in oil, and aquarelles of architectural subjects, sketches of interior decorations and furniture, designs and cartoons for stained glass and mural decorations, such as mosaics, tiles, etc., and also for decorative stuffs used for hangings; wrought iron and metal work, sculpture, carving, and plaster casts of architectural decorations used in construction. It was found that there would be a splendid display, in particular, of pen-and-ink drawings, for the present system of reproduction by printing from photographs on gelatine films has developed to an extraordinary degree this talent among architects architects.

architects.

"Contributions have been received from the following members: I. Laurence Aspinwall, C. B. Atwood, H. O. Avery, W. A. Bates, Charles I. Berg, W. B. Bigelow, A. Page Brown, A. W. Brunner, Edward H. Clark, Charles W. Clinton, John du Fais, President of the League; John W. Duncan, Charles Edwards, W. Hamilton Gibson, C. A. Gifford, A. D. F. Hamlin, W. C. Hazlett, F. L. V. Hoppin, James D. Hunter, William M. Kendall, Edward H. Kendall, David King, H. P. Kırby, Napoleon Le Brun and his two sons Michael and Pierre, W. P. Little, lames Brown Lord. Charles S. Luce. Riley, R. H. Robertson, John Beverley Robinson, E. K. Rossiter, William H. Russell, A. C. Schweinfurth, Edward P. Sperry, A. H. Thorp, Prentice Treadwell, Thomas Tryon, Frank Waller, Frank E. Wallis, Edward M. Welch, Stanford White, F. G. Willey D. W. Willard Frederick C. Withers F. A. Wiley, D. W. Willard, Frederick C. Withers, F. A.

Among the contributions will be the drawings for the Among the contributions will be the drawings for the great hotel called the Ponce de Leon, in St. Augustine, Fla., by Carriere & Hastings. Also there will be a series of large pen-and-ink drawings by Pennell of the Cathedrals of England, which will be studied with great interest. There will be also forty drawings made by draughtsmen under twenty-five years of a memorial clock and bell-tower on some village green, and the first placed will receive a on some village green, and the first placed will receive a valuable gold medal, the second a silver medal. Three hundred dollars have been set aside by the League for this purpose, and it is under contemplation to make the com-petition an annual one for the purpose of encouraging

good design and good rendering.

"Besides this exhibition there will be a loan collection of all the objects of applied art which are connected with architecture, and also of decorative objects tending to illustrate the artistic methods of using ornamental creations so as to obtain harmony of effect. The committee for this so as to obtain harmony of effect. The committee for this purpose is composed of H. O. Avery, Frederick Crowninshield, E. H. Blashfield, and John Gellatley. This committee has worked like so many beavers, and has obtained a wonderful collection of decorative stuffs, sculpture, tapestries, Venetian embossed leather, objects in ormulu, and in buhl work, Italian ivory marqueterie, enamels, carved wood, bassi-relievi, pictures, inlaid furniture, etc. Marcotte, Herter, and Cottier have seconded its efforts with the greatest zeal.

The committee has been enabled to borrow from the estate of the late Edward Mathews the twelve panels of the famous Galand, illustrating the months, which that famous connoisseur purchased from the Paris Exposition in 1867. Galand is the decorator who was employed to in 1867. Galand is the decorator who was employed to paint the panels of the large halls in the palace of the Czar at St. Petersburg, called the Winter Palace. This exhibition will also show splendid panel-work by American artists, Blashfield, F. S. Church, Shirlaw, Beckwith, Dewing, and John La Farge. The work of these gentlemen is to illustrate the manner in which painting must be modified when used for decorative purposes.

"A new form of tapestry-hanging will be introduced to

when used for decorative purposes.

"A new form of tapestry-hanging will be introduced to the American public. It is a stuff woven in such a manner that it can be painted on, and the pigments are dye colors, and as soon as applied sink in and become imperishable. Two specimens will be shown painted in the material by Galand, the subjects being 'Night and Morning,' replicas of two panels which he painted in the Winter Palace Morning,' repl Winter Palace.

"When it became evident that all the art world connected with architecture and internal decoration was enthusiastic over the exhibition, the idea was started that it would be a fitting opportunity to show some marked token of respect to Richard M. Hunt, who has been newly elected President of the American Institute of Architects, and who, during the current year, has received the cross of Chevalier of the Legion of Honor, and has been elected corresponding member of the French Insti-tute. It was therefore agreed that a reception should be held on Saturday, December the 17th, prior to the public opening on the following Monday."

THE TEXAS CAPITOL DOME SAFE.

A SPECIAL dispatch to the Chicago Tribune of December 10 states that the three expert architects-Harrod, of New Orleans, Clayton, of Galveston, and Heiner, of Houston-appointed by Governor Ross to examine the new State Capitol at Austin, Tex., now nearly completed, after a thorough examination report the great dome safe.

It will be remembered that there have recently been rumors affecting the stability of the dome, which, it is to be hoped, this report will set at rest-

BUILDING CONSTRUCTION DETAILS. No. IX.

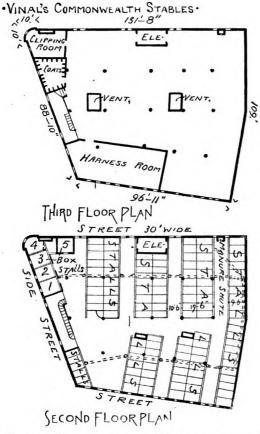

(Continued from Vol. XVI., page 678.) STABLE-FLOOR CONSTRUCTION.* Vinal's Commonwealth Stables.

THESE stables, which are just being finished for Mr. Warren D. Vinal to replace those bought by the Cab Company, are located on the opposite side of the B. & A. R. R., on two new streets just off of the new bridge being erected over the railroad on Boylston Street, Boston.

The structure is of brick, three floors and basement; covers about 11,000 square feet, and will cost about five dollars a foot. The floors are all 12 feet in the clear. All are supported on wood or iron columns, giving a clear space over the whole area.

The basement is to be used for storing carriages and has six inches of concrete; here is also located the engine and boilers for heating the building and supplying hot water, and the motive power for carriage-elevator and the clipping machines; also a manure-pit, some 10x20 feet, all bricked up and only accessible from outside.

The first or ground floor contains the offices, parlors, and waiting rooms and arrangements for storing and washing carriages.

The second floor contains stalls for about 120 horses. The third floor, originally intended for carriages, is about to be fitted up with about 90 stalls. Here is also a large harness-room, clothes-room for drivers, etc., and a clipping-room to contain four power clipping-machines. The fourth floor is for storage of carriages and sleighs.

A large elevator, some 9x18 feet, will run from basement to upper floors.

The second floor, the only one originally designed for stalls, is laid out with sloping floors. The floor is supported on three lines of 15x5-inch iron I-beams on 10-inch iron columns. On top of the I-beams tapering pieces of hard pine are placed under the stalls, having a thickness varying from nothing to $3\frac{1}{2}$ inches. The floor-joists, 3x14-inch, are set on these and covered with 1-inch matched boards. In this way the floor under the stalls is laid sloping, the lines of stalls being head to head, with a 10-foot 6-inch passageway between them, having a wooden gutter on each side. It is on top of this boarding that the Dolbear patent stable-floor is laid.

A sheet of English sheathing-felt is first laid over the whole floor, on which strips of white pine $2\frac{1}{2}$ x5 $\frac{1}{4}$ -inch are laid with $\frac{5}{16}$ -inch joints all around. The spacing is regulated by wooden wedges which are left in till the floor is double-nailed on each joist.

The 2½x5¼ pine strips are planed all over, and on the bottom both edges are rabbeted about ½-inch to give

* For previous articles on this subject see page 431, Vol. XVI.

the pitch a better hold. After being nailed firmly a hot mixture of pitch and pine tar is poured into the joints. In the passageways where the floor is level the joints are filled at a single pouring; but where the floor is inclined the pitch is poured at four different times. When all the joints are full the same hot mixture is spread in a thin coat over the whole floor.

The floor is thus rendered water-tight; the pitch sticks to the wood, and if it shrinks the pitch stretches and does not part from it as asphalt does. Oakum calked in makes a tight floor, but the urine destroys it.

This flooring costs about twenty-three cents per square foot. A spruce floor is laid above this, which can be easily renewed. In the stalls 2-inch spruce planks are laid crosswise for three feet at the head; for the rest of the way tapering planks from four to six inches wide are laid with one inch open joints. These planks are two inches at the upper end and 3½ inches thick at the foot, so that the horse stands on a level floor in his stall. Some hard-wood strips one inch square are placed in the bottom of the spaces between the plank; in this way the cleaning hooks do not strike into the pitch coating when cleaning out the drainage grooves.

In the Vinal Stables the stalls are 9 feet deep and from 4 to 5 feet wide. The sides and front are of 1¾-inch tongued and grooved hard pine, which runs up 7 feet on the front. At the sides are sloping wire screens, so the planking extends only 5 feet above the floor. Instead of

PAVEMENTS AND STREET RAILROADS.
No. XXII.

(Continued from page 22.)

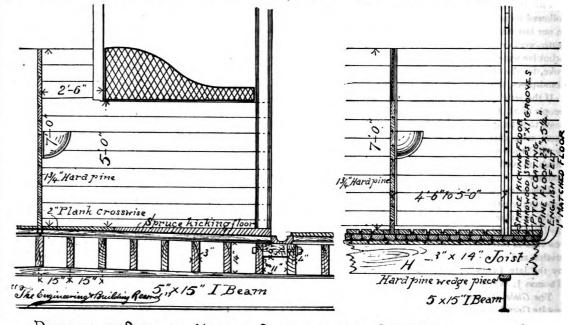

NOTES ON KING'S ROAD WOOD PAVEMENT.

[Prepared for The Engineering and Building Record by George E. Strachan, A. M. I. C. E., Surveyor of Parish of Chelsea.]

These works were executed as relief works in the early spring of 1886, and done without intervention of a contractor. The site is between Limerston Street and Stanley Bridge; the area paved being 6,666 square yards.

The road was previously covered with macadam consisting of Guernsey granite. It was excavated by means of steel wedges driven through the crust by sleuge-hammers. Then, when an opening was made, wedges were driven under the crust, and it was lifted by levers in pieces twenty feet square. These were broken to pieces by hammers, and screened through an inch sieve and then through a ½-inch sieve; 1,440 cubic yards were carted to the wharves for use on macadam roads, and the remainder (about 2,000 yards) was waste. The Lottom of the excavation was shaped so as to give the curve of road (see Vol. XVI., No. 12).

The surface thus prepared was covered with six inches of concrete, consisting of 5½ parts of Thames ballast to one part of carefully tested Portland cement. On this was placed ½ inch of fine concrete, three parts Thames sand to one of cement, laid and floated to a perfectly smooth

· DETAILS OF STALLS · VINALS COMMONWEALTH STABLES ·

solid posts secured to the floor-joists at the foot of the stall partitions, the post is formed of two 1¾-inch hard pine planks 8 inches wide set either side of partition, so that when either side is destroyed by kicking horses it can be easily replaced.

Two ventilating-shafts, 7xII feet, run to skylights in the roof from the ceiling of the second floor, with movable sashes in third floor for its ventilation through the same shafts.

A brick flue runs up from manure-pit, with iron door on the second and third floors for throwing manure into pit.

On the fourth floor a large chamber is partitioned off for storage of grain and hay, with door and tackle for hoisting the bales.

Two lines of 4-inch soil-pipes take the drippings from the middle of each gutter. These unite on the first floor, and in the basement all the soil-pipes empty into a 6-inch pipe.

pipe.

The plans were made by Alonzo S. Drisko, contractor and builder.

THE FIRST RACK RAILROAD IN FRANCE.

On the 6th of November the first rack railroad in France was opened to the public at Langres. We learn from Annales Industrielles that this city is located like an eagle's nest at an altitude of 1,550 feet, and the nearest railroad stations are several miles from the town. The municipal authorities have sought to remedy this state of affairs for a number of years, as the development of the city was seriously retarded. A number of plans were proposed, but preference was given to the rack and pinion system on a narrow gauge, to run from the Langres station at Marne to the centre of the city. The rack-rail system is the same as that at Righi, in Switzerland. The rounds of the rack are spaced .10 metre from centre to centre, and bolt through the sides, which are formed of pieces bolted to the ties. The rails are of steel, and the locomotive has a toothed wheel which engages the rounds of the rack.

surface. The method of laying was as follows: At gulleys (or catch-basins), which are 6½ inches below the curb, the centre of the road was made at such a height that ½ inch to the foot fall was given in the cross section. The channels (or gutters) had a fall of one in 150. The centre line of the crown of the road was made level, thus giving a fall in the cross section of ¼ inch to the foot at the summits of the channels. A narrow strip of concrete was placed in each channel and strips of wood laid on them and nailed to pegs at the exact grade. The crown of road had a similar strip of concrete and screeds also nailed. The templates were very accurately made to the curve of road, faced with iron, and when drawn along longitudinally by resting on the screeds they molded the fine concrete into a perfect curve.

The concrete was allowed to dry for seven days.

The blocks were yellow deal, 9x5x3 inches. Great care was exercised in rejecting bad blocks. The method used was as follows: An intelligent wood-pavior receives the blocks and rejects those which he is satisfied are bad, dividing those he passes into two lots: (a) Those that are without flaw or defect : (b) those which have only slight defect. Blocks rejected by him are not examined again. The lot (b) are examined by the clerk of works, who rejects such as he pleases, and sorts those passed into (c) those he considers fit, and (d) those which are doubtful. The lot (d) are examined by the surveyor, and the good ones passed. The paviors have instructions to throw out any defective blocks which have escaped, and after the blocks are laid, but before they are grouted, they are again looked over. Even then bad blocks get in. A fine of 10s. a 1,000 for rejected blocks is enforced. At first the con tractor has about 30 per cent. of his blocks rejected, but

he soon learns to sort over the blocks before sending them. On this work five per cent. of the blocks delivered were rejected (I in 20).

The blocks are separated by iron studs, as described in previous articles. They are laid with their lengths at right angles to the traffic, and the studs give a joint transversely of three-eighths of an inch.

The blocks are placed on the concrete, and the spaces at the joints filled in with cement grout (composed of 3 sand to 1 cement). Seven days are allowed for drying. The surface is then covered with very fine pebbles to a thickness of a quarter of an inch, and the traffic is turned on. The pebbles are crushed and the pieces are driven into the surface.

One inch in ten feet is allowed next the curbs for expansion.

The actual cost was-

	Total.		Per square yard.
	£. s.	ď.	s.

As to Life of Wood Pavements.—Eight years under traffics of 500 tons per yard in width every sixteen hours. (Blocks not creosoted.)

First three years no cost for maintenance. Next five average cost of 2d. per square yard.

The wood gets bumpy towards the seventh year.

Scavenging wood pavements costs in King's Road onesixteenth of what macadam does.

After washing and after rain wood pavements have a perceptible, but not unpleasant, odor.

Wood is practically noiseless.

Creosoting adds to the life of wood, but its cost is 1s. 6d. per square yard in addition to prices given. For streets with traffic weights under 500 tons per yard width in sixteen hours it does not pay, as creosoted and plain woods become bumpy after a certain wear, so that additional life is then an annoyance.

Hard woods are not good for wood pavements. The surface gets bumpy sooner than with soft woods.

Cement joints are water-tight and wear well.

Openings by water and gas companies are repaired by the Vestry. The excavation is rammed and watered, the concrete is carefully restored, and the contour preserved. The concrete is then allowed to dry; then the space is repaved, and not until the grout is dried is the traffic allowed over it. The actual costs incurred are refunded by the companies for whom the work is done.

THE STRENGTH OF IRON AS AFFECTED BY TENSILE STRESS WHILE HOT.

WE take the following abstract of a paper, recently read by Professor De Volson Wood before the American Association for the Advancement of Science, from the Stevens Indicator of October 15, believing that as we have recently given our readers some articles on the effect of cold upon structural iron and steel, they may be interested to learn the effect of the opposite extreme of temperature:

"In the course of my instruction I was asked how the strength of iron was affected by subjecting it to a tensile stress while hot. The question arose from the fact that a train of oil burned while standing on an iron bridge at New Brunswick, N. J. To determine the effect, I had twelve specimens of good iron prepared for the testing-machine by making the middle portion for about five inches cylindrical, and 0.770 inch in diameter. Two of these were broken cold, to determine the strength in its normal condition, the mean value of which was 50,500 pounds per square inch. Six of the others were heated in a forge to a dull red heat and at once subjected to a pull of 4,200 pounds, being one-fifth the strength indicated by the first two specimens, and the stress remained uniform for fifteen minutes, after which they were removed from the machine and allowed to cool, some in water and others in air. It is not apparent that the manner of cooling made any difference in the ultimate strength. The six pièces gave the following results:

 Maximum strength
 51,330 lbs. per sq. inch.

 Minimum
 47,720

 Mean of the six specimens
 49,765

"Four specimens were heated in a similar manner, though some of them were made somewhat hotter, and subjected to a stress of 5,700 pounds for fifteen minutes, being about one quarter the strength indicated by the two

first specimens; they were afterwards broken cold, with the following results:

 Maximum
 57,150 lbs. per sq. inch.

 Minimum
 48,290
 "

 Mean of the four
 50,026
 "

"The mean results indicate that there is a slight diminution of strength by stretching iron while hot, but if the stress does not exceed one-quarter of the ultimate strength, the loss of strength is scarcely more than one and a half per cent. The experiments indicate that unless there be a perceptible elongation while hot, the specimen is not weakened by the treatment. Thus one specimen elongated 0.23 of an inch for a length of five inches under a stress of 5.700 pounds, another 0.28 of an inch for the same length under a stress of 4,200 pounds, and still another 0.32 of an inch for the same length and stress as the former ones; and these were the only specimens that broke at less than 50,000 pounds per square inch. It is probable that these were hotter than the others when the stress was applied, as the eye was the only guide for determining the degree of heat."

REPORT OF THE WATER BOARD OF NEW-TON, MASS.

THIS report, though not bulky, contains some very valuable information.

By the suggestion of the City Engineer, Mr. Albert F. Noyes, a series of twelve tests were made to determine the bursting pressure of 6 and 8 inch cast-iron pipe. The thickness of the 6-inch varied from 0.53 to 0.56 of an inch, and the bursting strain was from 1,657 to 2,063 pounds per square inch. The 8-inch pipe were from 0.575 to 0.625 of a inch thick, and they burst at from 1,868 to 2,144 pounds. Of course, water-pipes have to bear other strains as well, but in good ground it would seem that there was no need of so great an excess of strength.

The dimensions of pipe in use are based on the "Shedd" formula.

Mr. Noyes also reports on tests of eight driven weils for increased water supply. A 30-days' pumping-test in a dry time gave a yield on the last day of 283,000 gallons, on which quantity the amount paid for the work was based for 24 hours' pumping as measured by a 4-inch "Gem" meter. The water was found in a coarse gravel and had a temperature of 50° Fah.

By pumping nine hours a day the yield apparently for 24 hours would have been from 309,000 to 335,000 gallons, reducing the water-level in the test-tubes about 16 to 19 feet. In the 30-day test the level was reduced as low as possible, or 22 to 23 feet. The water would rise in the tubes after pumping was stopped, at the rate of 12 to 14 feet in 30 minutes, and recover full depth before the next day.

The average daily consumption for the year was 675,298 gallons, ranging between 220,915 and 1,999,537 gallons, the population being in 1885, 19,759.

Meters are being introduced rapidly, 1,591 of all classes being now in use. There were 22,164 feet of new pipe laid during the year.

The cost of pumping a million gallons $216\frac{8}{100}$ feet was \$19.62, and per foot of dynamic head it was 9 cents. The cost of pumping figured on *total maintenance* was for the year \$271.75 per million gallons pumped, and \$1.25 for each foot of dynamic head it was raised.

THE MONTREAL WATER-WORKS.

THE report of these works for last year made by the Superintendent, Mr. Louis Lesage, is very full and complete. In the appendix are reports from Mr. B. D. McConnell, Assistant Superintendent, D. Kearney, Engineer of pumping-works, and Charles Lagace, foreman of distribution.

The present population of the city is 192,500.

The water is taken from the St. Lawrence River through five miles of open aqueduct, pumped into reservoirs and distributed through 23,553 feet of 30-inch pipe, 39,303 feet of 24-inch, 2,694 feet of 16-inch, 45,647 feet of 12-inch, 77,156 feet of 10-inch, 6,853 feet of 8-inch, 206,091 feet of 6-inch, 347,622 feet of 4-inch, and about 14,000 feet of smaller sizes. There are 13 30-inch valves, 32 of 24-inch, 4 of 16-inch, 63 of 12-inch, 91 of 10-inch, 28 of 8-inch, 301 of 6 inch, 625 of 4-inch, 38 of 3-inch, and 945 hydrants. Number of houses supplied, 29,981, the increase for the year being 1,326, and the increase in pipe laid 34,886 feet.

The daily average of water pumped was 12,643,000 gallons, an increase of 672,500 gallons over that of the previous year. The average to each inhabitant was 65.5 gallons, and to each consumer 65.8.

Of the 4,614,679,000 gallons pumped 3,873,647,000 was pumped by water-power (three turbine-wheels and one breast-wheel), at a cost for pumping-station expenses of \$1.61.9 per million gallons raised against a dynamic head of 194 feet, or of .83 per feet of dynamic head; 741,033,000 gallons pumped by steam (one Gilbert engine of 3,000,000 gallons capacity, and one Worthington of 8,000,000) for the low-level service, the cost per million gallons pumped against 173 feet dynamic head was \$23.38.8, or against one foot of head, .13.52, cents. For the high-level service, supplied by a Worthington engine of a half-million capacity, the cost for 230 feet dynamic head was \$53.32.2, or per foot 23.18 cents.

The cost per million gallons raised, figured on *Total Maintenance* of \$378,900 for the year, was \$82.11. Of this cost, \$207,214 was for interest on cost of works, and \$81,686 for maintenance. The expense of central office and salaries was \$11,287. The average cost for raising one million gallons against one foot of static head was .0127 of a cent by water, and .143 of a cent by steam. The average for the high level was .283 of a cent.

Of the total quantity consumed, about 9 per cent. was metered, furnishing a revenue of 16% cents per 1,000 gallons, or 1½ times that furnished on a rental basis. This difference will be increased when some arrearages are paid up. There are in all 549 meters in use, 86 having been placed and the use of 49 discontinued during the year; 20 were damaged by frost, and 7 totally destroyed.

The total income for the year was \$521,628.

Considerable repairs were made necessary by the heavy floods; and the water-wheels having been in use some thirty years must soon be renewed. The distribution in the central part of the city has been improved by new mains, giving a greatly improved pressure for fire purposes.

A system of house inspection has been instituted, and although not yet completed, 2,621 cases of defective fittings have been discovered, the average waste from each per hour being 11 gallons. Aside from this, 35 taps left open to prevent freezing wasted 16 gallons per hour, 44 taps to flush drains wasted 38 gallons per hour, and over 200 cases of illegal use of water were found.

The ground is frozen in the winter often to a depth of eight feet, and the number of times hydrants were frozen was two thousand five hundred and sixteen. It is found that hydrants nearer than six feet to a catch-basin or an open area are frozen much oftener than any others.

The thawing is done by two portable steam-boilers.

CAR-HEATING NOT FROM LOCOMOTIVE.

A "SAFETY" car-stove was tested in Chicago the other day, first by being thrown while red hot a distance of 128 feet to the ground, and then by being placed in a freight car which was smashed by an improvised collision. The first experiment was successful, the latter was not, for the car was incontinently consumed, and though the stove hardly had a fair chance, being surrounded by shavings saturated with turpentine, we feel confirmed in our longcherished conviction that the only safe place for the "safest" car stove is in the station or freight house; unless, indeed, the conductor is always as thoughtful as one on a Southern railroad where, to an old lady's complaint that the fire had gone out, the brakeman explained: Yes, ma'am. You see we're goin' to strike a stretch of poor track, and as the train's an hour late, the conductor allowed we'd better let the fires go out."

A CHART OF WIRE GAUGES.

WE have received from the Electrical World a copy, engraved and published by that journal, of the "Chart of Wire Gauges," described by S. S. Wheeler, Jun. Am. Soc. C. E., in a paper read by him before the American Society of Civil Engineers, of which an abstract was given in our issue of the 26th of November last. All the important and typical gauges, not only for wire, but for plates, screws, drills, etc., as well, are shown graphically. Each gauge is represented by a line whose vertical ordinates correspond to the gauge numbers and the horizontal ordinates to the diameters or thicknesses in thousandths of an inch. This shows at a glance the distinguishing features of each gauge and affords a very ready means of comparison, which will be appreciated by all who have occasion to specify the thickness of plates or wires by gauge numbers, which often seem inextricably confused.

TO ELEVATE THE TRACKS IN PITTSBURG.

THE special Committee on Grades and Crossings of the Engineers' Society of Western Pennsylvania held a meeting in Pittsburg on the 5th inst. to discuss and formulate a plan by which all railroads crossing important thorough fares in Pittsburg and Allegheny City can be put on elevated tracks The sentiment of the meeting was favorable to its feasibility.

WEDDED TO HIS PROFESSION.

A PARAGRAPH has been going the rounds of the press of late purporting to be a truthful account of a remarkable case of absent-mindedness which made a young man forget his wedding day. Apropos of which a prominent civil engineer told the following story to a reporter of the Chicago Tribune:

'I know of a much more remarkable case. absent-mindedness, however, but an illustration of the wonderful concentration of thought which is possible in reat emergencies. Somewhere about 1857, Ed. D. Iason, Assistant Engineer on the Wabash Road, went to Buffalo to be married. The ceremony was performed at 10 o'clock in the morning. While congratulations were being extended the newly-wedded Benedict received a telegram from his chief in Toledo informing him that an important truss-bridge over a river on the line of the road had been burned and must be rebuilt immediately. The working plans could not be found, and Mason was ordered home. As the trains ran he could not reach Toledo behome. As the trains ran he could not reach Toledo before the next morning. Taking a hasty adieu of the bride and the wedding party, and promising to return at 3 o'clock to partake of the wedding dinner, he hurried to the office of an engineer well known to him, who at once placed the facilities of his office at Mason's disposal. By 11 o'clock he was hard at work. When 3 o'clock came, feeling faint and weary, he walked down stairs mechanically, entered a neighboring restaurant that he had frequented before, refreshed himself with a sandwich and a glass of beer and returned to his work. By 5 o'clock he had duplibeer, and returned to his work. By 5 o'clock he had dupli-cated the original plans of the bridge from memory, including exact measurements and quantities, and tele-graphed them to Toledo. On this telegraphic plan the bridge builders instantly set to work and found it absolutely correct even to the minutest detail. It was a most astonishing feat. But what is still more astonishing is the fact that from the moment Mason left his bride in the morning until he had forwarded his telegraphic report he never recalled the event of his marriage. When he went never recalled the event of his marriage. When he we out for his lunch he might just as well have gone to wedding-dinner, as the distance was no greater, and excused himself without loss of time. But his mind was so intensely occupied in meeting the emergency that no thought of anything but the burned bridge could gain entrance. In later years Mason was a colonel in the army, entrance. In later years Mason was a colonel in the army, a prominent member of the American Society of Civil Engineers, and left as monuments to his skill the bridge over the Mississippi at Hannibal and that over the Missouri at St. Joseph. He died some thirteen years ago. His widow is still living, and has in my presence corroborated, in so far as she could, Colonel Mason's account of his wedding-day experience."

THE Austrian Hydrographic office publishes a new method for copying drawings. According to the Mittheilungen aus dem Gebiete des Seewesens, the paper upon which the copy is to be made is laid upon the original drawing and lightly rubbed with raw cotton soaked in pure benzine. The benzine is absorbed into the paper and renders it as transparent as the best tracing paper The finest drawings may be copied by pencil, pen, brush, or water-color, and there will be no tendency for the colors or the ink to run. The paper does not shrink or curl. The marks made by the pencil, pen or brush are much more difficult to erase. With large drawings portions may be copied at a time, and, whenever necessary. the benzine may be applied over again. When the copy is finished the paper is simply left to dry. The benzine will evaporate and leave no stain, while the paper will become as white and opaque as before and leave no odor of the benzine. Pure, clean benzine must be used.

[We have had good blue prints made from drawings on very thick paper which had been made temporarily transparent in the same way by saturating with benzine.--ED.]

THE Chronique Industriclle of November 6 contains a curious case in which the magnetic needle plays an important role. The daughter of a Mr. Preece accidentally stuck a needle into her hand which broke into three parts. Two of these parts were easily found and extracted, but the third could not be located. The Hughes' induction balance plainly indicated that the piece of needle was there, but not its position. Mr. Preece highly magnetized a fine needle and suspended it by a single fibre of silk. The deviations of the suspended needle always plainly indicated one particular spot when the sore hand approached it. After a number of trials with the same result, this point was marked, an incision made, and the third piece of the broken needle four millimetres long was found and easily extracted. THE Chronique Industrielle of November 6 contains a extracted.

SNOW AS A CONCENTRATOR OF ACID VAPORS.

UHLAND'S Industrielle Rundschau gives an abstract of a paper by R. Sendtner, published in the Meteorologischen Zeitung, explaining the injurious effect of snow on works of art. The author states that works of art deteriorate by climatic influences more rapidly in cities than in the country, and that the injurious effect has been much greater during the last forty or fifty years than formerly. The injury is mainly due to the presence of large quantities of sulphurous and sulphuric acids in the atmosphere of cities since coal has been used in dwellings and factories. These acids are absorbed by the moisture on exposed works of art, and the effect is that of a bath in dilute sulphuric acid. Mr. Sendtner shows that snow has a peculiar power for absorbing these acids. Fresh snow at Munich and at Forstenreid, five miles from Munich, was examined and found to contain seven to eight milligrams of sulphuric acid per kilogram of snow (or about six-hundreths of a grain to one pound of snow). Fourteen days after this snow had fallen it was again analyzed, and that at Munich was found to contain sixty-one milligrams of sulphuric acid per kilogram of snow, while that at Forstenreid had not absorbed any additional amount. City snow must therefore be especially injurious to statuary, works of art, etc. No remedy is suggested, except that which is self-evident, to box the statues which may be exposed.

[This danger should be borne in mind by architects and sculptors in Northern cities, and their work so designed as to afford as little lodgment for the snow as possible. Paraffine or soluble glass would perhaps give efficient protection, and shellac varnish also resists dilute acids. Fortunately the parts most exposed to the action of the acids absorbed by snow are usually least exposed to view. and hence discoloration either by corrosion or the use of a protective will be less injurious.

We should be glad to hear from those who may have had experience in this matter in some of our specially smoky cities, such as Pittsburg used to be, either as to the effects of corrosion or the efficiency of protectives. _Ep.1

La Lumière Électrique states that the French threadworks of Oudin et Cie at Dinant, which have used 36 electric arc lamps during the past year, have discarded the use of gas entirely. A comparison of the cost of gas and electricity at these works is made as follows:

COST OF GAS FOR ONE YEAR.

Three hundred and sixty burners of 123 litres at 0.18 francs per oic metre [about \$1 per 1,000 feet—ED.]; cost per hour 7.97 francs. Eight hundred and fifty-seven hours at 7.97f 6,820.30f.

Net saving by use of electricity	3.547.30%

SEWER VENTILATION DIFFICULTIES.

MR. JOSEPH GORDON, M. Inst. C. E., the Borough Engineer of Leicester and President of the Association of Municipal and Sanitary Engineers, in his annual address reviewing the progress of sanitary engineering, thus referred to the difficulties attending attempts at sewer ventilation. His report of the attempt to utilize factory chimneys to receive sewer-air is similar to that made by all who have tried it-namely, that it is of little use except in sections in the immediate vicinity of the chimneys. It must be borne in mind, however, that in the older cities of England and the continent the problem is a more difficult one because of the narrowness of the streets. In that respect the cities of the United States are more favored. and the complaints against manhole ventilation are seldom heard, which system is the one adopted and best suited to the conditions generally existing in this country. Mr. Gordon savs:

"Sewer ventilation seems unsolved, and I would earnestly entreat members, all of whom have, more or less, opportunities of experimenting and making observations of the behavior of sewer-gas under certain conditions, to direct their attention to this subject. It is admitted on all hands that the sewers must be ventilated—that is, that

there must be a means of escape for the polluted air of the sewers, for it is well known that the conditions prevailing within the sewers during the twenty-four hours of the day are very varying, and on this subject the early observations of the late Medical Officer for the city of London (Dr. Letheby), and the present Engineer for the city of London (Lieutenant-Colonel Haywood), and the still more recent investigations of Professor Pettenkofer, of Munich, Proinvestigations of Professor Pettenkofer, of Munich, Professor Soyka, of Prague, and our own members, Mr. McKie, of Carlisle, Mr. Read, of Gloucester, and others, are well worthy of attention. It does not, however, seem to be so readily or universally conceded that a plentiful supply of fresh air is of equal importance, and that the great aim and object of sewer ventilation should be the introduction of atmospheric air for the purpose of diluting and oxidizing the air of the sewers, and the creation of a current to some exit, which shall, if possible, either be above the roofs of the houses, or still better, to some point where the sewer-gas can be cremated. The most recent contribution to this subject, in direct opposition to these views, is to be found in the address of Professor Attfield to the Hertfordshire Natural History Society and Field Club, in which it is laid down that all that is necessary is vent at an elevation above the ground, and that, therefore, the surface ventilators or other openings for the introducthe surface ventilators or other openings for the introduc-tion of fresh air are not only not necessary, but are, on the

contrary, injurious, even when acting as down-cast shafts.
"These aims and objects are beset with difficulties, and
the most scientific minds of the country have failed so far to devise a method of ventilation, which shall at the same time be within the range of practical application as regards

time be within the range of practical arcost, and universally satisfactory.

"The report of last year of a Committee of the Metropolitan Board of Works is worth attention, as showing the metropolitan surveyors. Out of the forty opinion of the metropolitan surveyors. Out of the forty districts the opinions of whose surveyors were taken, thirtythe were in favor of open ventilation, two were doubtful, two against, and one had no experience in this matter. The average distances of the ventilators were from 30 to 200 yards, and the committee came to the conclusion 'that pipe ventilators of large section can be used with great advantage in addition to, and not in substitution for, surface ventilators.

"To supplement the street openings as much as possible with vertical cast-iron or other shafts up the house sides would seem to be the first thing to do, for there can be no doubt the more this is done the more perfect will be the ventilation of the sewers. It must also not be forgotten that the anxiety of late years of English sanitarians to protect each house from the possible dangers of sewer-gas from the street sewer has led to a system of so-called disconnection of the house-drains by a water-seal or syphon-trap, and that consequently the soil-pipes of the houses, which, when carried through the roofs, acted as ventilators to the public sewers, have been lost for this purpose, and thus the difficuity of sewer ventilation has been greatly To supplement the street openings as much as possible the difficulty of sewer ventilation has been greatly

In Leicester we have been fortunate enough to secure the co-operation of factory owners, who have allowed us to connect no fewer than fifty-two chimneys, while we have already carried out, at a cost of about \$1,250, 146 special shafts up the house sides, with a locked opening upon a large number of them, by means of which we can test the velocity of the current as well as the temperature of the outflowing air. The connections with the high factory chimneys are all of too small a calibre to be of great use, being generally only six inches, with a few exceptions of

being generally only six inches, with a lew exceptions of ninc inches in diameter.

"The radius of effect of specially-erected chimneys, as shown by the experiments of Sir Joseph Bazalgette, and as experienced with the special ventilating towers erected at Frankfort, is disappointing and discouraging when the cost is taken into consideration. It cannot be expected, however, that manufacturers will admit larger connections to be made with their chimneys otherwise of course much ever, that manufacturers will admit larger connections to be made with their chimneys, otherwise, of course, much more satisfactory results would be obtained. To fall back upon special shafts up the house sides means, in my opinion, that there should be probably as many in number as are represented by the soil-pipes of the houses, for in this we have a tested example at Frankfort, which, so far as I know, has up to the present moment proved eminently satisfactory. The distance apart of such shafts would largely depend on the size of them, but as a rule it will be found house owners object to large pipes, in which case the found house owners object to large pipes, in which case the number must be increased, and if we take a distance of about thirty yards, we should require about 5,000 such shafts in Leicester.
"Whether some artificial means of inducing currents in

sewers by drawing down fresh air from shafts above the eaves of the houses, and sending forth the diluted sewergas to still higher levels, or burning it in an outcast shaft, will take the place of natural ventilation, and prove to be less costly and more certain in its action, remains to be seen; but it is quite certain that notwithstanding the patents which have already been taken out and failed, and those now before the public, there is still a wide field of re-search before this question is satisfactorily solved so that no cause whatever shall remain of complaint on the part of

THE NEW MILWAUKEE DRY DOCK.

THE WEATHER HEW MILEWACKEE DAY DOCK.

THE weather for the past three months has been everything that could be desired for pushing work on the Milwaukee Shipyard Company's new dry dock, and in consequence it is well advanced toward completion. If the present mild weather continues, the contractors, Messrs. C. H. Starke & Co., hope to have the dock finished in another month.

ANCIENT AND MODERN PLUMBING-WORK IN LONDON

LONDON, November 27, 1887.

SIR: As a comparison between ancient and modern plumbing I send you rough sketches of old work taken out and new work recently done at an old building in the city of London. The old work was so defective and the smells that escaped from the soil-pipes, etc., had become so bad that it was found necessary to entirely renew the whole of work. Figure I is an elevation and Fig. 2 is a plan of one section of the system The soil-pipes were six inches internal diameter and

were made of cast sheet lead, averaging about nine or

sewage would have full play on the insides of the pipes

sewage would have full play on the insides of the pipes and traps even if the top ends were open. This has been noticed in other cases. The vertical pipes and the under half portion of the branch-pipes were not in the least affected by sewage gases, but this was no doubt because they were thickly coated with fur, which was in some cases nearly an inch thick.

Figure 3 is a view with figured dimensions, and Fig. 4 a section of the traps that were fixed beneath the water-closets. Figure 4 also shows the furred matter that had accumulated inside the traps. One trap had only 2½-inch waterway through, as shown in the section. Pan water-closets were fixed over these traps, which were flushed by means of service-boxes in the cisterns, situated immediately over the pipes, being three-quarters of an inch in diameter. It is probable that plumbers in the olden times did not know the value of ventilation-pipes, and to prevent syphonage of water out of the traps used them extra vent syphonage of water out of the traps used them extra large, fixed soil-pipes so large that they could not charge them full bore, and then, to make extra sure, fixed small-sized service-pipes. There is no doubt, from their point of view, they were entirely successful. It is difficult to surmise what the complication of branch-pipes had been

ELEVATION FIG The Engmering Building Hears Fig.2 FIG.5 ELEVATION g & Building Record" PLAN Fic. 6

ten pounds per foot super; the thickness being about .170 of an inch. The seams were wiped and bore evidence of good workmanship. Instead of the soil pipes being bent to suit their positions soldered elbow-joints were made. As the work had been fixed some 70 or 80 years it is probable that the art of bending large-sized pipes was unknown at that period. The soil-pipes were entirely unventilated, excepting that two of them had been connected with leaden rain-water pipes. From the more modern character of these rain-water leaders there is no doubt they were added in later years. This opinion is strengthened by the fact that the traps and horizontal branch-pipes were perforated that the traps and horizontal branch pipes were perforated by corrosion nearly, if not quite, as much as those that had no ventilation. There were no air-inlets at the bottom of the soil-pipes, they being trapped at the bottom, and in the absence of an air-current, the carbonic-acid gas from

Figures 5 and 6 are respectively elevation and plan of the new work substituted. The main stack of soil-pipe was 4 inches in diameter, with 3½-inch branches to the traps. Each trap had a 2-inch lead vent-pipe branched into a common vent. The common vent-pipes were branched into that at the top of the soil-pipe. The new closets were of the valve description, and were flushed by means of 1½-inch valves, and regulators attached to the apparatus, the service pipes being 1½-inch in diameter. apparatus, the service pipes being 1½-inch in diameter. A stop-cock was fixed in each branch service-pipe, so that if one of the water-closets had to be removed for repairs the other water-closets were not deprived of their water-supply. The whole of the work was executed by Messrs. Dent & Hellyer, and the frequenters of the place now speak highly of the improvements made and also the absence of all smells. Yours truly, J. W. CLARKE.

The interest in the foregoing description is the method of connecting the vent-pipe to prevent syphonage of the trap, which, it will be noticed, is a few inches beyond the water-seal. The account of the plumbing work a hundred years ago will also interest some of our readers. -ED.]

PROPOSED CHECK ON SKIN BUILDERS AND PLUMBERS.

THE New York Board of Health has long realized that certain builders and plumbers have the disposition to willfully ignore the notices of violation of the Plumbing and Tenement-House Acts. This results in many useless inspections, waste of time, and diversion of the force of inspectors (none too large) from current duties.

They have, therefore, decided to invoke the co-operation of General Newton, Commissioner of Public Works, whose department issues permits for water service, in withholding permits from these violators of the law.

We understand that General Newton has received an opinion from the Corporation Counsel that the Board of Public Works is justified in refusing a water permit until the requirements of the Board of Health regulations are complied with. It is proposed to require every application for a water-permit to be accompanied by a certificate from the Board of Health that no violations of the Plumbing or Tenement Acts are existing on record against the building.

It is to be hoped that General Newton will adopt this important and desirable measure, that can be opposed by none except the skin builders, the plumbers who co-operate with them and their partisans, whose influence is not likely to receive his consideration.

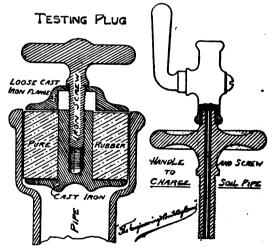

When this desirable measure of protection is secured, the Board of Health should also co-operate with the Water Department to check waste of water by having their inspectors report all instances of this character that come under their notice.

PLUGS USED IN TESTING SOIL-PIPES WANTED.

TORONTO, November 30, 1887.

SIR: Will you kindly give a description of plugs or stoppers used in the testing of soil-pipes and drains, and also state where the same can be procured? By giving this information through your valuable columns you will confer a favor on, Yours truly, SUBSCRIBER.

[Recalling the fact that we once saw a test of soil-pipes in a hotel building in Boston where Mr. John H. Stevens was the plumber, we wrote him for a sketch of the plug he then used. The accompanying illustration is from the sketch he sent us, and his letter is as follows. If any of our readers have different devices we shall be glad to illustrate and describe them:

"In regard to testing plugs, for benefit of 'Subscriber' and others we enclose drawing of our testing-plugs, which we think will explain themselves.
"We can furnish the testing-plugs of any size, if desired.

For further information address

JOHN H. STEVENS & Co., 634 Main Street, Cambridgeport, Mass."

RUBBER BALL FOR TESTING DRAIN-PIPES.

OUR Milwaukee correspondent writes that the plumbers have a great deal of trouble testing the drains. All new drains and extensions must be tested by the plumber when work is done, and the plumbing inspector will call and see the test made, if notified. No work can be covered inside of a building until it has been so tested. Sand bags, bladders, rubber foot-balls, legs of overalls, and other

Digitized by GOGIC

devices are used to plug up the sewers, but there are objections to one and all of them. Prederick Hamilton, of Milwaukee, has invented a device for this purpose and did not think it of any value, as he supposed few would be used. His idea is to have rubber balls (that may be made nearly solid) of the sizes of the sewers, 4, 5, 6, and 8 inch. Through these balls a common iron bolt can be inserted, Through these balls a common iron bolt can be inserted, If the nut on this bolt is screwed up after the ball has been placed in position it will be readily seen that the ball will be squeezed against the sides of the sewer so tightly that no water could possibly leak past it. If the plumbers of this country want such a device, it will pay Mr. Hamilton to have them manufactured.

The principle of the expanding plug here suggested seems to be the same as that shown in the sketch sent by Mr. Stephens and illustrated in this issue.

WHY STEAM-TRAPS REQUIRE A SLIGHT PRESSURE IN PIPES TO INSURE THEIR OPERATION.

SIR: In Baldwin's book, "Steam-Heating for Buildings," pages 192 and 193, he says that the return steam-trap operates with vacuum and pressure alternately. Now, the maker of the Curtis steam-trap says it requires one pound pressure in the steam-pipes to elevate the water from the receiver to the trap for every two feet of elevation. Will you please let me know if it requires enough pressure to force the water to the trap same as if the pipe were open at the same height. Respectfully yours, W.

[The trap will work at any pressure above the atmosphere and if the valves are absolutely steam-tight there may be a vacuum. This is not so in practice, however. and the makers guarantee only where there is two pounds pressure or thereabouts to every foot the trap is above the apparatus, for the reason the valves leak sufficiently to soon destroy a vacuum. Also in case of a vacuum, or partial vacuum, it would take longer for the trap to fill, as any little remaining hot water would give off steam

Whether the pipe is open at the top or not does not affect the result, and it will require no more pressure in one case than the other, as the pipe ends in the body of the trap, which is practically open.]

COOKING APPARATUS FOR PUBLIC INSTITU-TIONS.

AKRON, O., December 10, 1887.

SIR: Will you kindly place us in correspondence with ne best manufacturer of steam kitchen and cooking ppliances. We desire to get what information and prices appliances. we can regarding everything necessary for a large hotel or public institution, the most modern and improved. By doing so you will greatly oblige,

Yours truly, WEARY & KRAMER.

[Referred to our readers.]

THE PLUMBING IN THE WELD HOUSE.

WASHINGTON, D. C., December 7, 1887.

SIR: I understand that you do not endorse as correct in principle the house-drainage work which you illustrate and describe without comment, but I think many of your and describe without comment, but I trink many of your readers have the impression that the specimens selected represent not only some of the most elaborate and expensive, but also the approved methods of the time. Certainly, the casual reader of short acquaintance with the of schools, clubs, and public libraries) is not likely to get the idea that the methods shown are notably bad or get the idea that the methods shown are notably bad or wrong. Therefore, when I notice such conspicuous illustrations of "how not to do it," as figures 9 and II on page 10 of the current volume, I am constrained to call your attention to the mischief they may do. I refer to the great number of bends at the right of the basin-outlet, and to the wooden grating under the sink. It may be that the basin waste-pipe is so connected with the main lines of the system that there is no tendency to loss of seal in the trap upon the discharge of a neighboring water-closet; but the plumber's apprentice, for example, finding this illustration as he looks over the journal in the noon hour at the shop, is not apt to reason that this noon hour at the shop, is not apt to reason that this arrangement, while safe in exceptional cases, affords no protection against loss of seal in the majority of situations. It looks like a neat, compact arrangement to a machinist's eye, and it makes an impression in his brain that will some

day, I fear, develop into an imitation.
I fail to understand why, in publishing so conspicuous an example of one of the most common and serious faults in what is called the "fine plumbing" of to-day, it does not seem wise to you to point out the evil and explain the rrect method, even though you may have done it a score

of times already.

If you had added some such note as the following it would, in my mind, have increased greatly the value of the illustration and saved a deal of harm:

"[Of course our plumbing readers of long standing will perceive that this arrangement is seriously faulty, and they do not need to be told why. To our new and inexperienced readers we explain, that the main object of trap ventilation being to prevent loss of seal from a suddenly

creased or diminished pressure in the waste-pipe below he trap, the vent-pipe shown in the illustration is in the main useless, because of the obstruction to the full and rapid movement of the air offered by the five sharp turns rapid movement of the air offered by the five sharp turns in so short a distance. The air-pipe should have been attached on the bend below the trap, forming a nearly straight continuation of the vertical portion of the wastepipe (of the same size) and turning back to the wall by a long, easy curve, making only one bend (in the course shown) instead of five.]"

The wooden grating is much less dangerous, for it is to be presumed that a house having such elaborate fixings would have a neat housekeeper—and surely no neat housekeeper would long tolerate such a dirt-accumulator.

keeper would long tolerate such a dirt-accumulator.

Dana C. Barber.

[Our correspondent is too extreme in his criticism in this case. It is always desirable to have as few bends as possible in an air-pipe, yet in practice elbows or bends cannot always be avoided, for obvious reasons, though there might have been one less in this case. Of course, long bends present less resistance than short ones to the passage of air, but this matter must be treated from the practical side as well as the theoretical.

The member of our staff who made the sketches from which our illustration was made states that to obviate the resistance due to bends and long pipes, diameters have been increased until sizes have been reached which seem to answer all practical purposes, in this case as well as others. Moreover, in this job the length of the backair pipe to the point where it joins the vertical cast-iron pipe is inconsiderable.

With regard to the wooden grating under the sink, the drawing should have shown it in sections. It must be remembered it was for a special purpose. The sink, as was stated, was for a photographer's use-undoubtedly for amateur photography. It was in the dark-room, and had a leaden safe under it. On this safe was laid the wooden grating to prevent slipping, etc.; and though it might be objectionable under a kitchen or slop sink, we see nothing to criticise in this case, as the grating can be lifted out and washed-an advantage a wooden floor would

Our descriptions of current work are selected, as our correspondent has intimated, as matters of interest to architects and plumbers. In this, as in every other construction illustrated, it is not intended, nor do we believe is it understood by our readers, that we endorse every detail shown. Whenever we consider a matter dangerous we call attention to it, but the purpose of presenting the different methods in vogue in different cities is to facilitate comparisons, furnish suggestions, and elicit discussion from our technical readers. Our opinion as to what we should do in a given case we give in our answers to questions. If we acted on the advice of our correspondent to select any detail that we did not fully approve of, in every piece of work that we were permitted to illustrate, as a text to condemn the practice, opportunities for illustrating anything, from a roof to plumbing, would soon be withdrawn

Moreover, our readers perfectly well know our position on this matter of vent-pipes on traps. It often happens that to secure neatness in appearance a compromise from the theoretical ideal is adopted; while we might not do it ourselves, we do not feel justified in criticising others who elect to do so if no danger is incurred thereby.

Indeed, in nearly every piece of work we illustrate this question comes up. Within reasonable limits, therefore, we prefer to leave criticism to our readers.]

THE MOTIVE POWER OF THE WORLD.

(From the London Times.)

FOUR-FIFTHS of the engines now working in the world have been constructed during the last twenty-five years. France owns 49,590 stationary or locomotive boilers, 7,000 locomotives, and 1,850 boats' boilers; Germany has 59,000 boilers, 10,000 locomotives, and 1,700 ships' boilers; Austria, 12,000 boilers and 2,800 locomotives. The force equivalent to the working steam-engines rep-

resents—in the United States 7,500,000 horse-power, in England 7,000,000 horse-power, in Germany 4,500,000, in France 3,000,000, and in Austria 1,500,000. In these figures the motive power of the locomotives is not included, whose number in all the world amounts to 105,000, representing a total of 3,000,000 horse-power. Adding this amount to the other powers, we obtain a total of

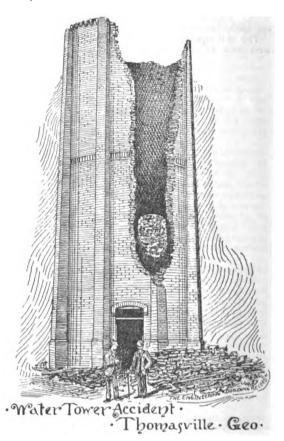

A steam horse-power.

A steam horse-power is equal to three actual horses' power; and a living horse is equal to seven men. The steam-engines of the world represent, therefore, approximately the work of 1,000,000,000 men, or more than double the working population of the earth, whose total population amounts to 1,455,923,000 inhabitants. Steam has accordingly trebled man's working power, enabling him to economize his physical strength while attending to his intellectual development.

THE RUINED WATER-TOWER AT THOMAS-VILLE, GA.

WE have received from a correspondent in Thomasville photograph of the water-tower in that town, whose destruction we described in our last issue, and reproduce from it the accompanying illustration, which tells the story very plainly.

The first accounts ascribed the fall of the central pier, which was the immediate cause of the disaster to the vibrations of the hod-elevator. Our correspondent thinks from an examination after the accident, that the fall of the central pier was due to unequal settlement. Probably both causes operated together, each intensifying the effect of the other, until the equilibrium of the pier was destroyed.

Some of the settlement observed after the accident may have been the effect rather than the cause of the overthrow, as while the pier was going over its entire weight would be borne on a small portion of the side toward which it leaned, and the increase thus caused in the intensity of the pressure would almost certainly cause more or less compression or settlement of the foundation.

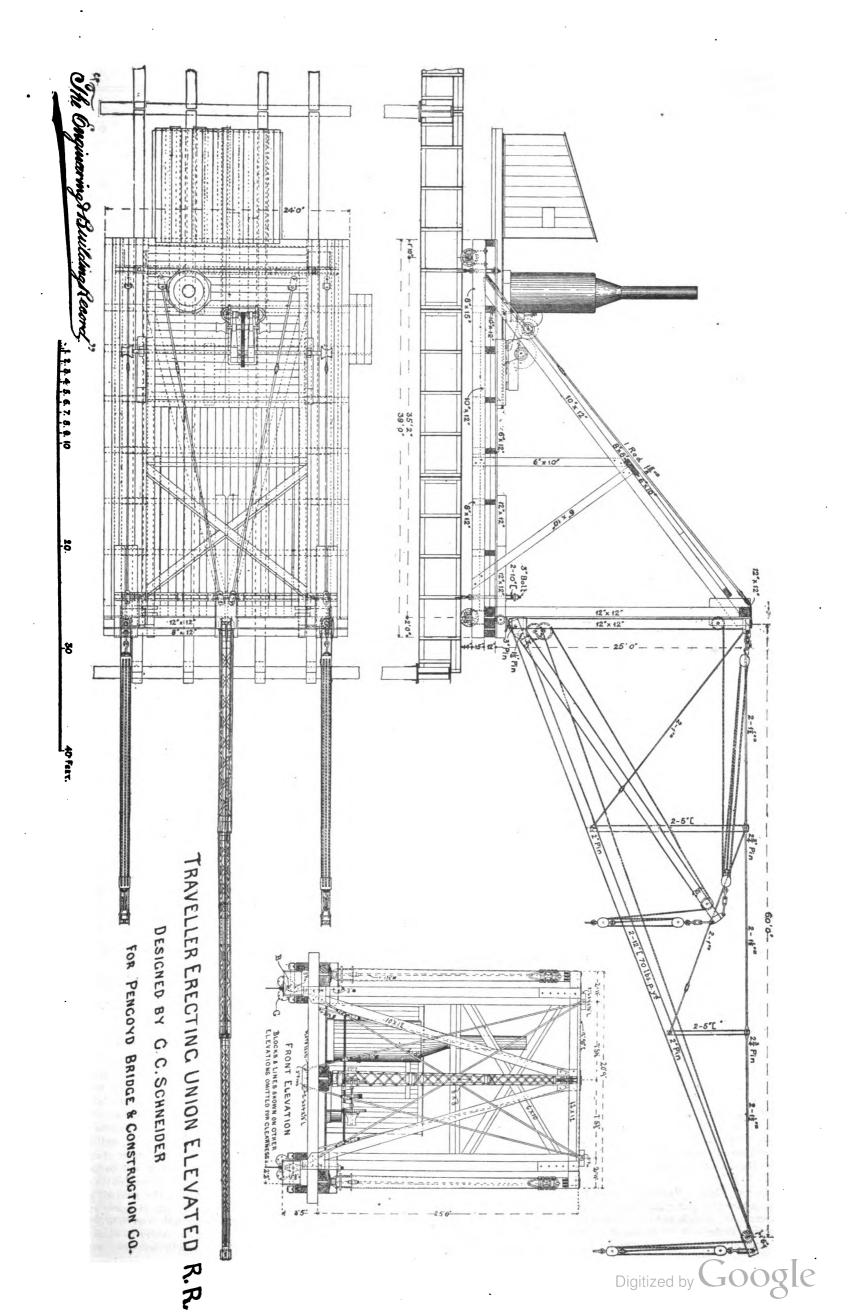

In endeavoring to account for an accident it is often difficult in examining the wreck to distinguish cause from effect, though, of course, all pains should be taken to do so. The writer well remembers an accident which occurred on a building whose erection he was superintending, which at first glance seemed unmistakably due to the giving way of an eye-bolt to which a tackle was attached, when subsequently investigation showed conclusively that the eye-bolt was the last thing that gave way and that the disaster was due to an altogether different cause.

PROJECTED RAILROAD IN BUENOS AYRES BY AN AMERICAN ENGINEER.

THE Philadelphia Times says:

"Henry Mactier, a well-known civil engineer of this city, will sail for South America on December 13, to project a railroad for a syndicate of English capitalists. His destination is Buenos Ayres, Argentine Republic.

"The proposed road, with its branches, will extend from Buenos Ayres to Pergamino and Cordoba, a distance of 450 miles across the pampas. The Government has granted a subsidy of \$700,000 and a guaranty of six per cent. annual income upon the investment. The failure of the United States to form a treaty with its sister republic has created a sentiment of discrimination in the Argentine Republic against the United States. When contracts for railroads are let the specifications call for English steel and English iron. Mr. Mactier is in communication with New York parties who are seriously contemplating taking advantage of the favorable subsidies offered by the Argentine Republic, and if further railroad construction is feasible the advantages will be reported to the New York capitalists."

BUILDERS' AND CONTRACTORS' ENGINEER-ING AND PLANT.

No. XXVII.

(Continued from page 11.)

SIX-TON UNIVERSAL TRAVELING CRANE FOR ELEVATED ROAD ERECTION.

THIS traveling derrick, designed for the Pencoyd Bridge and Construction Company by C. C. Schneider, their chief engineer, to be used in erecting the section of the Union Elevated Railroad, in Brooklyn, for which they are contractors, is so fully shown and dimensioned in the accompanying illustrations as to need little explanation and less comment. This description, promised in our issue of November 16, but held over for more complete drawings, was proposed before the accident therein described, and will be of additional interest as showing that mishap to have been due to no fault of the crane. arrangement, connections and details of this traveler have been designed with more than ordinary care, and corresponding good results have been secured in its performance. Its operation is as follows: The permanent structure being completely assembled and bolted up to the last pair of columns, the traveler is advanced until the front wheels nearly reach the last transverse girder; the grips G (see front elevation) then clutch the top chord of the longitudinal girder, and are locked fast by the bolt B; the sixty-foot iron derrick in the centre then sets the next pair of columns, placing them in their pedestal sockets and lifts the transverse girder into position on top of them; then the side derricks raise the longitudinal girders, the bolting of the section is completed, and the operation repeated on the next section, leaving the riveting gang to follow at a convenient distance.

The long centre derrick is not adjustable vertically, but the side booms can be raised or lowered by the mast-head tackles.

Each derrick is designed for a maximum load of 12,000 pounds, its greatest possible duty, and figured for low unit strains.

Fourteen-inch triple-sheave purchase-blocks, with falls 1½ inches in diameter, are used for all the hoisting tackle. Each hoisting fall is carried to the centre of the mast of its derrick, just above the boom connection, and axially down through the hollow bearing and from the fixed sheave below direct to the winch-heads. The fall of the centre derrick thus leads directly to the winch-heads on the hoisting engine, and those of the side derricks to a pair of winch-heads on the extremities of a long transverse shaft, thus avoiding snatch-blocks and short turns.

Special pains have been taken to avoid any tendency to "kick" on the part of the base-blocks on which the derricks rest by giving them ample bearing surface and strongly securing them.

The engine is a standard "four-winch reversible hoister," designed and built by Copeland & Bacon, of New York. It is identically the same as that used on the traveling derrick of the Phænix Bridge Company in the erection of the Kings County Elevated Railroad, described and illustrated in our issue of June 4, except that one of the transverse shafts has been lengthened so as to secure a straight lead for the side derricks.

The total weight of the traveler, including engine and boiler, is about 72,000 pounds.

(TO BE CONTINUED.)

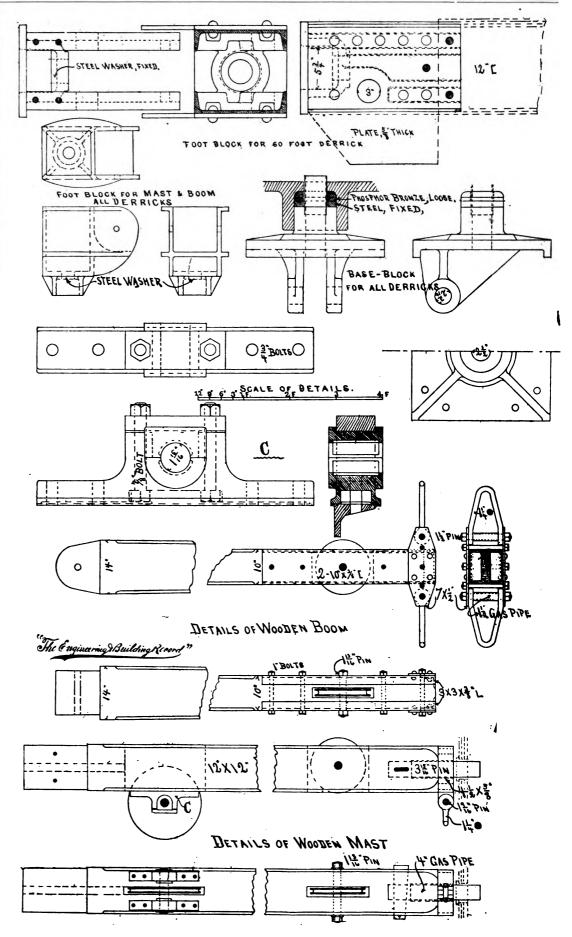

THE NEW ENGLAND WATER-WORKS ASSOCIATION.

THE December quarterly meeting of this society was held at Young's Hotel, Boston, on Wednesday, the 14th inst., with an attendance of seventy-five members and guests. At a business meeting before dinner the following gentlemen were elected to membership:

Active—Josiah S. Marcy, Treasurer, Gardiner, Me.; Weston Lewis, Treasurer, Waterville, Me.; Ezra Clark, President, Hartford, Conn.; Henry W. Ayres, Engineer W. W., Hartford, Conn.; William H. Thomas, Assistant Superintendent, Hingham, Mass.; Frank A. Andrews, Assistant Superintendent, Nashua, N. H.; J. C. How, Superintendent, Bath, Me.; A. I. Jones, Superintendent, New Brunswick, N. J.

Associate—Turner, Clark & Rawson, Boston; M. J. Drummond, New York; T. J. McKenna, New York.

Lunch was served at 1 o'clock, and was followed by an interesting paper by Professor T. M. Drown, of the Massachusetts Institute of Technology and Chemist to the

DETAILS OF ERECTION TRAVELER USED BY THE PENCOYD BRIDGE AND CONSTRUCTION CO., ON UNION ELEVATED RAILROAD, BROOKLYN.

Massachusetts State Board of Health, on "The Odor and Color of Surface Waters." The paper will be published in full in the journal of the association and we can at this time only note some of the leading points.

Dr. Drown called attention first to the fact that there is no necessary and inevitable connection between the color and odor of water, though the determination and measurement of each are important factors when taken in connection with other results of a complete examination. He described the methods followed in the determination of these points, and enumerated the terms employed to express the relative degrees and characteristics of each. The odor given by a water when cold may be the same as that given from the same water hot, or it may be en-

tirely different, and a careful distinction was made between an odor which is ready formed in the water and one which the water is capable of generating under the influence of chemical action. Some connection exists between the color of water and the quantity of albuminoid ammonia found on analysis, and an experienced analyst can predict, with some degree of confidence, the quantity of this substance which will be found in a given sample of water, by a measurement of the color according to an arbitrary scale. The removal of coloring matter by alumina has, in certain cases, reduced the amount of albuminoid ammonia from 69 to 83 per cent.

The albuminoid ammonia which remained after treatment by alumina in these cases was probably an indica-

UNION ELEVATED RAILROAD, BROOKLYN-PENCOYD BRIDGE AND CONSTRUCTION CO.'S ERECTING TRAVELER.

tion of colorless nitrogenous animal matter in the samples. Dr. Drown thought that the light suspended matter in potable water should not be removed before chemical examination, because it is not removed before reaching the consumer.

An ordinary sand filter may be rendered effective in the matter of removing color by the addition of clay or loam, and, in doing this, the amount of albuminoid ammonia will be reduced.

The fact was noted that a high color does not prove that the water is not safely potable, for the coloring matter may come from vegetable matter in no condition tending to decay. The paper closed with a word of caution against hasty conclusions from the figures of water analysis, and referred to the necessity of supplementing the examination in the laboratory with a careful study of the conditions in the field.

The paper was followed by a discussion brought on by questions addressed to Dr. Drown by different gentlemen, in which the methods of water analysis were briefly indicated, the value and meaning of the results were explained, and the impossibility of setting up any fixed standard of purity plainly stated. The practical value of the systematic analysis of waters from all parts of the State which is now being carried on under the direction of the State Board of Health was shown and endorsed in the remarks of Mr. Stearns, Engineer of the State Board, Mr. Fitz Gerald, of the Boston Water-Works, Mr. Allen, City Engineer of Worcester, and others, and the meeting adjourned to meet the second Wednesday in January, 1888.

THE ENGINEERS' CLUB OF KANSAS CITY.

A REGULAR meeting of the Club was held on December s.

There were present Messrs. William B. Knight, C. E. Taylor, J. A. L. Waddell, T. F. Wynne, B. L. Marsteller, S. A. Mitchell, H. G. Wade, C. H. Talmage, A. J. Mason, W. Kiersted, K. Allen, secretary and treasurer, and six visitors.

The secretary then read, in the absence of the author, a paper entitled "Deviation of the Ship's Compass," written for the Club by Mr. H. C. Pearsons, of Ferrysburg, Mich.

After a brief discussion, a vote of thanks was extended to Mr. Pearsons for his valuable paper, and to Mr. Kiersted for the paper presented at the previous meeting.

Mr. J. A. L. Waddell then read some abstracts from a paper on "General Specifications for Highway Bridges of Iron and Steel," describing at length the letting of county bridges, with some defects of methods in use.

Notice was given by the president that the annual meeting would be held December 19, after which the meeting adjourned.

THE ENGINEERS' CLUB OF PHILADELPHIA.

THE Engineers' Club of Philadelphia held their usual business meeting on December 3. President T. M. Cleemann occupied the chair and thirty-eight members were present. Officers for 1888 were nominated. Mr. Percy T. Osborne presented an illustrated paper on the Palmetto Railroad, the connecting link in a new through line to the South. Mr. R. B. Osborne presented an illustrated paper upon the Unaccountable Deficiency in the Track of American Railways. Mr. Osborne deprecated the continued use of the unsatisfactory spike and offered a suggestion for a spike-headed bolt—partly in accordance with established English practice and partly of his own design but unpatented—to pass entirely through the tie.

THE LONG-PROMISED UNDERGROUND RAILWAY.

SIR: The opportunity for an underground railway presented by the proposed widening of Elm Street is, indeed, inviting; principally because it seems to permit the construction of a road with all the advantages and few of the disadvantages of the Arcade plan. The consent of property owners cannot reasonably be withheld; the interference with street travel and with pipe-service during construction and many similar objections are at once set aside. Many of the best streets of London and a large portion of the underground railway of that city are indebted for existence to the ability of the parties most in interest to unite on joint plans of construction.

on joint plans of construction.

General New on, in an interview published last week, characterizes the building of New York City as seemingly "due to chance, and a very bad chance." It is to be hoped that in the inception of such an undertaking as the Elm Street improvement, over and under ground, enough time will be allowed and sufficient skill displayed to insure the city something more than a simple street opening of the old school. Here is an opportunity to build a street the equal of Broadway, with the advantage of providing for rapid transit of an improved form.

Rapid transit seems to have come to us heretofore as the result of chance, and without the benefit of very carefully considered plans. The underground plans are in this respect worse than the elevated. The Arcade railway gave us the gist of its present plan twenty years ago, and in some respects its most recent plans are more stupid than those first presented. A single-cross-section of a street suffices to hang an entire scheme upon, while the real railway difficulties, engines, cars, connections with other lines, crossings, terminals, stations, etc., are scarcely considered. Yet we are told that the construction of this railway is to be commenced immediately.

railway is to be commenced immediately.

In the Elm Street project it seems as though we were to get a section of underground much on the same principle on which Mrs. Toodles secured the door-plate, because it was cheap, and might, under certain favorable

conditions, be useful. A careful consideration of the transit problem shows that it is absurd in a city like New York, to think of having any line unless forced into a street either entirely in tunnel or entirely in viaduct; both systems must be used to get the best effect.

With engines as at present constructed it is hardly probable that three miles of continuous tunnel could be operated with rapid-transit trains with any comfort to the passengers; this has never yet been done in city railways, I believe. Under a street like Elm Street or Broadway it is impracticable to discharge smoke or receive air even at definite points. Much can be done with coke as fuel and the improved mufflers, but not all, and the steam locomotive is still our best if not our only locomotive. Again, accidents will happen; we must not expect anything else with human frailty, and the light of day and exit from the top of the tunnel at convenient and frequent intervals is a necessity.

The ideal railway is located through the blocks between the streets as far as practicable, elevated over valleys like that at Canal Street and where it may be necessary to connect with surface or elevated railways, and underground in all other places, deep enough often to go under the sewers. It is provided, wherever opportunity presents, between the houses in blocks and at other points, with breathing spaces or well-holes. The injury to property and the interference with local improvements and with public comfort are not so great in such a line, and the road has more freedom in construction and operation than on a continuous viaduct. If right of way must be purchased the valuable portion of it, so much as fronts on the cross streets, can be utilized. This kind of an underground I hope we shall one day obtain.

What is needed in New York City is not so much more north and south lines as greater comfort for passengers and better means of communication between other lines of travel. The elevated roads have four splendid routes through the city, and we are promised that double the number of passengers now carried will be carried over these routes in the near future. The limit of the structures, long ago predicted as at hand, is now reached, while the inability to use heavy engines forbids the running of long trains and the much-needed increase of speed. Heavy engines are required for short stops at stations, and for great speed between stations. We were very tired of the horse-cars and welcomed the elevateds with open arms. It is probable that we shall be just as tired of the elevateds before we get our first underground line, and shall extend just as warm a greeting to it.

This metropolis has three large rivers in its midst, none of which can be bridged as simply as the Thames or the Seine, and two of which should not be bridged more than once. Our western connections cannot depend in the future ent rely on the ferries, and tunnels must follow the opening of any underground road. In January, 1886, the Brocklyn Bridge Kailway, after being in operation two years, carried 60,000 passengers daily. It now transports 90,000 daily, and 10,000 to 12,000 per hour during the busy hours of the day. Twenty miles of new elevated railway in Brooklyn means a development of population and transportation more or less tributary to our city railways, which one bridge will be all too small to accommodate, and an East River tunnel will be sadly needed before we get it.

Digitized by Google

The business island below Canal Street is, fortunately, high above the tide, and composed of a splendid building sand, free from rocks or boulders; for tunnel purposes it rivals the boasted London clay. Real estate is so valuable in this district, and building space so limited, that within thirty years all the steam railways and all the passenger and freight depots, which will be necessary in this district, should be found below the surface of the ground. From subterranean depots lines will extend across both rivers, and in various directions uptown. It is unwise to predict how extensive the underground traffic will become when once commenced. This city will certainly te the largest in the world, and that quickly. Capital will be ready to build on well-formed plans. Let Elm Street be ready to build on well-formed plans. Let Elm Street be opened, and let the underground be built beneath it if you must. I protest only against a chance consideration of the subject of underground transit. It is not enough to build lines merely to compete with the elevateds. must build better lines, profiting by their shortcomings and by the ten years' experience which they have given us. Build a structure, then, which your grandchildren shall be proud of, and such as to adjust itself easily to the extensions and connections which will be made on all sides; such a one as our memorial increasing in a rapid progression, shall not soon over reach.

Yours respectfully,

INTER-METROPOLITAN. sides; such a one as our metropolitan transit, evershall not soon over-

DOES A SANDSTONE PEDESTAL NEED BOXING?

MISS WHITNEY, the sculptress of the Erickson statue at Milwaukee, has written to suggest that the pedestal of the statue on the lake bluff be covered during the winter to protect it from the severe frosts. The sandstone is expected to grow harder and firmer with exposure, but Miss Whitney thinks some protection should be had for the first winter. The matter has been referred to the Board of Public Works. The board thinks that a recent sudden change of temperature has been as severe a test as it will have, and as the pedestal has not been injured at all by it they are of the opinion that no covering is necessary.

We think that sandstone is much more likely to be injured if at all by changes of temperature, even if small, just about the freezing point—i. e., alternate freezing and thawing -than by much greater changes which do not pass the freezing point.

It is the harder stones such as granite that are most apt to be injured by great and sudden changes in temperature, which are most likely to occur on a clear winter morning following a very cold night, when one side of a stone cooled perhaps to many degrees below zero is suddenly exposed to the direct rays of the sun, and thus rapidly heated while the mass remains cold. The unequal expansion thus caused has been known to produce cracks, and if water once enters frost will speedly complete the destruction.

We commend to the perusal of such of our Milwaukee friends as may be interested in the preservation of their statue and its pedestal, the article found elsewhere in this issue on the deleterious effects of snow on exposed works

COLONEL ADAMS' RECEPTION TO WILLIAM E. WORTHEN.

NOTWITHSTANDING the very stormy day, the reception by Colonel Julius W. Adams and Mrs. Adams to the retiring President of the American Society of Civil Engineers, held on Thursday evening last at their residence in Brooklyn, was very well attended, and proved a highly enjoyable and very successful affair. Among those we recall as being present were: Past President Mr. and Mrs. Francis, of Lowell; General John Newton, Hon. J. S. T. Stranahan, Mr. and Mrs. B: S. Church, Mr. and Mrs. Wellington, Mr. and Miss Croes, Mr. and Mrs. J. F. Ward, Mr. Lebbius Ward, Mr. Asserson, Mr. Beckwith, Mr. Bogart, Mr. Brackenridge, Mr. and Mrs. H. W. Brinckerhoff, Mr. and Mrs. A. G. Brinckerhoff, Mr. Bryson, Joseph P. Davis, Mr. and Mrs. Charles E. Emery, J. Forster Flagg, Mr. and Mrs. Henry Gielow, General George S. Greene, Mr. George S. Greene, Jr., Mr. S. S. Haight, Mr. Charles W. Hunt, Mr. William R. Hutton, Mr. C. C. Martin and daughter, Mr. and Mrs. E. P. North, Colonel William H. Paine, Mr. S. R. Probasco, Mr. and Mrs. William Rumble, Mr. J. F. Sorzano, Mr. D. McN. Stauffer, Mr. J. H. Striedinger, Mr. Robert Van Buren, Captain E. B. Van Winkle, Mr. and Mrs. John F. Ward, Mr. Charles D. Ward, Mr. L. B. Ward, Mr. Arthur M. Wellington, Mr. and Mrs. Thomas D. Whistler, Mr. and Mrs. Henry C. Meyer.

ADDRESS OF DEALERS IN ASBESTOS AND PIPE-COVERINGS WANTED.

BUFFALO, N. Y., December 14, 1887. SIR: I am desirous of entering upon the business of covering steam pipe with asbestos and hair-felt. I am unable to get information from local dealers as to the address of firms supplying that class of goods. I have read your valuable paper since '81, and now beg, as a that you give me the desired information.

Information wanted concerning asbestos, plaster, in barrels; asbestos, fibrous, in sheet; hair-felt, different thicknesses; mineral wool, other than Cleveland make.

F. J. Tolles,

262 N. Division Street.

[Referred to our readers. You will find in our advertising columns firms who deal in these materials.]

EIGHTEENTH ANNUAL REPORT OF THE MASSACHUSETTS STATE BOARD OF HEALTH.

UNDER a State act of 1886, the State Board of Health of Massachusetts has been re-established upon substantially the same basis as that which it had eight years ago, although with increased duties and powers. The organization of the new board was effected in May, 1886, and the eighteenth annual report of the board before us really covers a period of but four months, and is interesting rather because of the indications which it gives of the purposes of the board than as a record of work accomplished. . It contains, besides the general report, a special report

of the results of an inquiry into the transmission of infectious diseases through the medium of rags made by Dr. Charles F. Withington; reports on food and drug inspection; weekly mortality reports; reports on the health of towns, and a "Manual for Boards of Health."

The report of Dr. Withington is a carefully prepared paper embodying the results of extensive research, and as Massachusetts consumes one-third of all the rags used for manufacturing purposes in this country, it is evident that his field of inquiry was large enough to give valuable results. The magnitude of the interests involved may be inferred from the fact that the census of 1880 showed that in that year the consumption of rags by the paper industry amounted to 187,917 tons, and the value of the product to \$55,109,914. About forty per cent. of the rags thus used come from foreign countries, and it is with regard to these imported rags that the controversy as to the necessity for using a patent system of disinfection has chiefly occurred.

Dr. Withington gives a detailed account of the methods of collecting and handling rags, a historical sketch of the disinfecting regulations, and statistics of the health of paper mills and their vicinity so far as probably affected by rags. The conclusion, as summed up in the report of the board, is that "in Massachusetts no infectious disease has ever been traced directly to the medium of imported rags, except small-pox, and that disease in a very few instances only. Not a single case of scarlet fever, typhoid fever, diphtheria, cholera, or anthrax has ever been shown conclusively to have been transmitted by rags imported as such from countries outside of the United States." die of the United States." Dr. Withington remarks that despite the fact that cholera is not known to have ever conveyed to this or any other country in foreign baled rags, it is a reasonable precaution to prohibit the landing in any United States port of rags gathered in epidemically infected localities. * * * Such prohibitions should be limited to the time and place of epidemic infection; but all necessary precautions should be taken to make sure that rags shipped from a healthy port were not gathered or baled in an infected place." He points out that systematic enforcement of vaccination and revaccination among papermill operatives is the only safeguard against the chief danger from rags, and that "as domestic rags comprise more than half those used, and represent a still larger proportion of the infection likely to be carried, it follows that they should participate in whatever disinfection is thought necessary. This fact points to the paper mill as the proper place for making such disinfection." The italics are ours

The reports on food and drug inspection by the officer of the board are, as usual, very valuable. This branch of sanitary work has been better managed in Massachusetts in any of our States, and the reports of work done contain substantial new information rather than quotations from foreign authorities and declamatory statements about the way people are being poisoned.

The reports on the health of towns are chiefly of local

interest, and educational in character.

The "Manual of Health Laws" is a summary of all

laws and decisions up to date, and seems to be an excellent piece of work. An important part of the report is that relating to the water-supplies of the State, which is noticed in our editorial column.

The people of Massachusetts are to be congratulated their present State Board of Health. Its plans for on their present State Board of Health. Its plans for future work are wise, and on broad lines, and every facility should be given to it for carrying them out.

THE CLOCK AND BELL TOWER COMPETITION.

THE forty-four designs for the "Memorial Clock and Bell Tower on a Village Green," entered in competition for the gold and silver medals of the Architectural League were on view to art writers on the 14th inst. at 10 West Twenty-third Street, the office of the Secretary. One design was thrown out for want of compliance with the programme.

All drawings were signed with motto or cypher, and the name and address of the authors will not be known until the evening of the reception, the 17th.

The gold medal was given to a design bearing a cypher of three towers charged upon a shield; the silver medal to the design signed "Tuxedo," and honorable mention to "Mephistopheles," "Villager," and a T charged upon a shield, the whole surrounded by a laurel wreath.

The gold-medal design is a low square tower pierced at the base by four broad arches. The walls are boldly battered and the tower is crowned by a belvidere covered with a low pyramidal roof. The large arches are in cut stone, while the walls are built of the rough field boulders.

The effect is quiet, simple, and unpretending. The whole structure is some twenty feet square at the base, and perhaps not over thirty-five to the top of the roof, and eminently fitted to the conditions of the problem.

The perspective is rendered in pen and ink in a most masterly manner; indeed, it is a pleasure to see such a strong, vigorous, and dignified drawing in these days of childish mannerisms among draughtsmen.

The only objectionable feature in this design is the enormous size of the wrought-iron clock-dial, it being perhaps twelve feet in diameter at a height of twenty from the ground.

The silver-medal design is a rather labored and delicate pen-and-ink drawing of a tower crowned by an ugly concave roof of too high pitch. It is designed to be executed in brick and stone in a style modelled after the French manoires.

Above the first story the front of the tower sets back, one corner being carried up as a turret. It would be supposed that this would contain the staircase, but upon on inspection of the plan it is found to be put to the purposes of a closet. A feature, charming in itself, is thus rendered abortive. The design, however, well merited the second place by reason of its general fitness.

Of those honorably mentioned the design of "Mephistopheles" ranks first. It is a beautifully rendered watercolor of a tall stone tower, strongly influenced in design by the clock-towers of Lombardv.

The treatment of the top-two bells in two arches, the whole under one arch and a roof and backed by a belvidere-is charming in its picturesqueness, while yet restrained and dignified. The tower is too tall, somewhat "wire-drawn" in fact, while the portico at the entrance is weak, almost childish. Had a quarter of the height been taken out of this tower it would probably have secured the second place.

These three designs are far and away the best. The two other designs mentioned are great, square stone towers, strongly influenced by the Gothic, that of "Villager" being the best.

Other designs worthy of note are those bearing the motto "Seats of my Youth, etc.", which, it is strongly suspected, is by the author of the gold-medal winner, "Quilp," in Romanesque; "Cacelia von Donatello" (sic), in the same style: "Nobody," "Romano," "Simplex," who has just missed a good thing; and "Time Flies," a beautiful pen-and-ink drawing, but a most ill-considered

As a whole, the competitors have missed the spirit of the programme, but have at the same time made careful studies, and with marked and creditable success.

It is worthy of note that the designs receiving the medals are both rendered in pen and ink, while the mentioned drawings are all in color. Whether it is owing to conditions obtaining at this special exhibition, or extending throughout draughtsmen generally, cannot be stated, but it seems true that our young men are stronger with the nen than with the brush. The result of this first the pen than with the brush. competition has been very satisfactory, and augurs well for those to come.

THE chief of the German Admiralty has issued instructions that, as whole black pepper absorbs moisture, steel pens, keys, and small iron and steel articles should be stowed with black pepper to preserve them from rust on board ship. White pepper does not possess such hygroscopic properties.

WORCESTER, MASS., PLUMBING ORDINANCE. ADOPTED NOVEMBER 25, 1887.

SECTION 1. The Board of Health may license proper persons to carry on the business of plumbing.

persons to carry on the business of plumbing.

Sec. 2. No person shall carry on the business or do any work of plumbing, unless he shall have first obtained a license and registered his name and place of business in the office of the Board of Health, and notice of any change in the place of business of a registered plumber shall be immediately given to said board. Provided, that this section shall not apply to employees while working for licensed plumbers. licensed plumbers.

licensed plumbers.

SEC. 3. Every dwelling-house where a public sewer abuts the estate shall be supplied with a water closet for every fitteen persons, conveniently located and constantly supplied with water. All water-closets constructed after the passage of this ordinance must be supplied with water from a special rank or cistern not used for any other purpose. a special tank or cistern, not used for any other purpose unless permission has been first obtained from the Board of Health to use other fixtures. It shall, in all cases, be connected directly with the general or common drain-pipe of the house. The common drain-pipe shall be separately and independently connected with the public sewer, wherever such sewer is provided, and if there is no such sewer, with a properly constructed cesspool of a capacity approved by said board.

SEC. 4. Where it is necessary to lay soil pipe under the ground, it shall be of the quality known as "Extra Heavy Pipe." The length passing through the walls of the building shall also be of extra heavy pipe. All cast-iron pipes must be sound and free from holes and other defects, of a uniform thickness and of not less than the weights specified below for the corresponding diameters, and before use unless permission has been first obtained from the Board

fied below for the corresponding diameters, and before use shall be thoroughly coated inside and out with coal-tar or an equivalent substance.

External diameter, ordinary pipe:

Drains and soil pipes through which water and sewage is used and carried shall be of sound iron when within a building, and for a distance of not less than five (5) feet outside the foundation walls thereof. They shall be securely ironed to walls or laid in trenches of uniform grade, or suspended to floor-timbers by strong iron hangers or as the said board may direct. They shall have proper fall towards the drain or sewer, and soil-pipes shall be carried out through the roof, open and undiminished in size, to a distance not less than two (2) feet above the roof or as the said board may direct. Changes in direction shall be made with curved pipes, and all connection with pipes shall be made with Y-branches. Every waste-pipe used for conducting waste-water from sinks or other fixtures shall be carried through the roof, open and undiminished in size, to a distance not less than two (2) feet above the roof or into soil-pipe above highest fixture.

SEC. 5. Rain-water leaders must never be used as soil,

SEC. 5. Rain-water leaders must never be used as soil, waste or vent pipes, and when connected with soil or drain pipe shall be suitably trapped.

SEC. 6. Sewer soil-pipes or waste-pipe ventilators shall not be constructed of brick, sheet metal or earthenware, and chimney flues shall not be used as such ventilators.

SEC. 7. Joints shall be run with molten lead, packed with oakum, and thoroughly calked and made tight. Connections of lead pipes with iron pipes shall be made with brass ferrules, properly soldered and calked to the

SEC. 8. Every sink, basin, bath tub, water-closet, slop-SEC. 8. Every sink, basin, bath tub, water-closet, slophopper, and every fixture having a waste-pipe shall be furnished with a trap. Traps shall be protected from syphonage or air-pressure (when such make of trap is used that is liable to syphonage) by special air-pipes of a size not less than the waste-pipe; but air-pipes for water-closet traps shall be of not less than 2 inch bore. Air-pipes shall be run as direct as practicable, and shall not be of less than 4-inch bore where they pass through the roof. Two or more air pipes may be connected together or with a soil-pipe; but in every case of connection with a soil-pipe such connection shall be above the upper fixture of the building.

Sec. 9. Waste pipes from refrigerators, or other receptacles in which provisions are stored, shall not be connected with a drain, soil-pipe or other waste-pipe, unless such waste-pipes are provided with traps, suitably ventilated; and in every case there shall be an open tray between the trap and refrigerator.

SEC. 10. Pipes and other fixtures shall not be covered or concealed from view until after the work has been examined by the said board, and the plumber shall notify said board when the work is sufficiently advanced for inspec-

SEC. 11. No steam-exhaust shall be connected with any soil or waste pipe or drain which communicates with a public sewer.

SEC. 12. A grease-trap shall be placed under the sink of every hotel, restaurant, eating-house, or other public cooking establishment.

SEC. 13. For every license granted under the provisions of this ordinance there shall be paid to the clerk of the Board of Health the sum of one dollar for the use of the

Sec. 14. All previous ordinances, rules and regulations inconsistent herewith are hereby repealed.

MILWAUKEE ORDINANCE PROVIDING FOR SAFETY IN THEARES, ADOPTED DECEMBER 5, 1887.

THE Mayor and Common Council of the city of Milwaukee do ordain as follows:

SECTION 1. It shall be unlawful for any person, persons, or corporations to hereafter use or permit to be used any building or structure for the purposes of theatrical or public entertuinments in the city of Milwaukee, unless the provisions hereinafter contained shall have been fully complied with, and any person who shall be convicted of violating the provisions of this ordinance shall forfeit of not more than one hundred nor less than twentyfive dollars.

SEC 2. All buildings used for theatrical or public entertainments shall have a water stand-pipe and water-plug to be placed on the stage or platform, or in its immediate vicinity, which shall be connected with the water-pipes of street-mains in the street corresponding with stand-pipe and with the hose-coupling of the fire depart-ment of the city of Milwaukee, and shall be put in under the direction and to the satisfaction of the Chief of the Fire Department and Inspector of Buildings.

Fire Department and inspector of buildings.

Sec. 3. Standard hose of the kind used by said fire department shall be attached to such stand-pipe of such size as may be directed by said Chief of the Fire Department, and shall have nozzle and stop-cock attached thereto; such hoze shall be of sufficient length to extend thereto; such noze shall be of sufficient length to extend to the furthest limits of such building or place of amuse-ment, and shall at all times be kept in good order and repair, tested once a month under the direction of the Chief of the Fire Department, and filled with water, under pressure, for immediate use, and placed upon automatic reels.

SEC. 4. All buildings used for the purposes aforesaid, with accommodations for one thousand or more persons, shall have at least one stand-pipe in the street or alley on the outside of the building, from ground to roof, with hose attachments, close to a window or door at each floor and gallery.

SEC. 5. All buildings used for the aforesaid purposes shall also be provided with a fire-alarm telegraph apparatus, connected by the necessary wires with the headquarters of the city fire-alarm, or such other place or places as the Chief of the Fire Department may direct.

SEC. 6. The manager of every theatre, or place of public entertainment, shall employ a man of competency, satisfactory to the Chief of the Fire Department, whose whole duty during performances within such place shall be to take charge of the fire apparatus of such theatre during the performance.

SEC. 7. The cylinders used in the production of calcium light at any theatrical performance within the city of Milwaukee, shall be plainly marked, respectively, oxygen and hydrogen, and the complete exterior surface of the cylinder used for hydrogen, and so marked, shall be the cylinder used for hydrogen, and so marked, shall be painted or colored white, except where lettered, and the complete exterior surface of the cylinder used for oxygen, and so marked, shall be painted or colored black except where lettered. Any manager of any theatre within the city of Milwaukee who shall use, or allow to be used, at any theatrical performance within said city any calcium light, unless the person operating such light shall have a certificate from some competent chemist whose competent certificate from some competent chemist whose competency shall be satisfactory to the Mayor of said city, certifying that such person has been examined by said chemist, and that he is competent to manufacture and use calcium lights.

Any cylinder used for the production of calcium lights shall not be charged with gas or manufactured at the place in which the performance is to be held.

SEC. 8. All ordinances and parts of ordinances in conflict with the provisions of this ordinance are hereby repealed.

TEST OF THE NEW HIGH-SERVICE PUMPING ENGINE AT MILWAUKEE.

G. H. BENZENBERG, City Engineer of Milwaukee, reports to the Board of Public Works that the 24-hour trial run for the purpose of testing the capacity and duty of the two steel tubular boilers and 6,000,000 gallon pumping-engine, furnished by Mr. E. P. Allis for the High-Service Pumping Works, has been satisfactorily completed. His report says:

The conditions of the contract require that the engine and pumps deliver 6,000,000 gallons of water against a pressure of 60 pounds, with a duty of 115,000,000 foot pounds per 100 pounds of coal consumed in the boiler furnaces, without any deductions of whatever kind, and at a steam-pressure not to exceed 80 pounds.

Accordingly an official test was made the coal being

Accordingly an official test was made, the coal being such as is used every day. Records of the counter, steam, receiver, vacuum, suction and force-main gauges, and of the temperature and quantity of the feed-

water, were taken every fifteen minutes during the run, also of the quantity of the coal used and the state of the water in the boilers.

The diameter of the plunger in each pump is 21½ inches and the length of stroke is 3 feet, making the theoretical capacity of each pump 363.05x36+231-56.58, or, for the three pumps, 169.74 gallons. The total number

Total number of pounds of coal consumed......5.075

GOVERNOR JOSEPH R. BODWELL

GOVERNOR JOSEPH ROBINSON BODWELL, of Maine, died suddenly on December 15, at his home in Hallowell, Me., of paralysis of the heart. He had been ill for two weeks but his condition was not regarded as serious.

Governor Bodwell was born on June 18, 1818, at Methuen, Mass. While working a farm he took steps that led him into a special business career in which he afterwards became famous. Twenty-five years ago, when capitalists first began to utilize the water-power of the Merrimac, at Lawrence, Mass., Mr. Bodwell was employed to haul granite blocks from Pelham, N. H., for the construction of a dam. In this capacity he became familiar with quarrying and working granite. From this beginning he was remarkably successful, rising from the position of humble employee, with goadstick and oxen. to the head of the granite business in the United States.

So small was the beginning of this granite business that he used to haul the stones out himself with one yoke of oxen. But from this modest commencement eventually sprang into existence the Bodwell Granite Company, probably the leading company of its kind in the country. Of this corporation, and also of the Hallowell Granite Company, Mr. Bodwell was the president, and it is but two years ago that he was reckoned as one of the richest men in the State of Maine.

Mr. Bodwell was elected Governor of Maine on the Republican ticket in September, 1886, and filled various other political positions of trust and honor.

Governor Bodwell was twice married, his second wife being a sister of his first wife.

JOHN C. COCHRANE, architect, of Chicago, Ill., is

PERSONAL.

MR. RUDOLPH HERING has been requested by the City Council of Montgomery, Ala., to examine and report upon the sewerage system proposed for that city by Mr. Williamson, City Engineer.

MR. EDWARD E. MAGOVERN, Jun. Am. Soc. C. E., for several years in the employ of the New York Steam Company as Assistant Engineer in charge of the Division of Steam Supply, has associated himself with Mr. H. W. York, formerly of the United States Revenue Marine Service, and more recently connected with the New York Steam Company, as consulting engineers and experts in steam and mechanical matters, at 22 Cortlandt Street, New York City.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

. OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITIONS.

GALVESTON, TEX.—The time for receiving plans, etc., for the Sealy Hospital has been extended until January 15, 1888.

ELKTON, KY.—Plans and specifications are wanted here for a school building. Address John O. Street.

JOLIET, ILL.—At a recent meeting of the Common Council the City Clerk was authorized to advertise for plans and specifications for the City Hall and Public Library building to be erected next spring.

ALBANY, N. Y.—Superintendent of Public Instruction Draper has received forty plans and specifications for school-houses, ranging in price from \$600 to \$10,000, in response to the request for modern plans, with a view of adoping those most suitable. No decision will be made as to the successful plans until next month.

TRADE CATALOGUES.

WE have received from The Gurney Hot-Water Heating Co., of 237 Franklin Street, Boston, two well-executed lithographic sheets illustrating the working of The Gurney Hot-Water Heater.

For works for which proposals are requested see also the "Proposal Column," pages i-iv-viii-47.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE ENGINEERING & BUILDING RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will jut us in the way of obtaining early and relable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not eisewhere published, will be liberally paid for.

WATER. SEWERAGE, ETC.

ST. AUGUSTINE, FLA.—It is probable that the Common Council will soon decide upon a definite plan of establishing a sewerage system in this place. Investigations are now being made and a conclusion is expected soon. Mr. G. W. Atwood is at the head of the project.

MACON. GA.—An election is to be held here January 7 to decide the question of issuing \$150,000 in bonds for sewerage, parking and street paving.

LAWRENCE, KAN.—A special committee consisting of Messrs. Hemphill, Stone and Monroe, of the Common Council, have been instructed to confer with some competent engineer as to the estimated cost of construction of a city sewerage.

MOORESTOWN, N. J.—The Moorestown Water Company has not yet succeeded in procuring a water supply for the town. The intention at first was to rely upon a series of wells for the supply, but the scheme was deemed impracticable.

NEW BRIGHTON, Mo —The village authorities of this place offer the East St. Louis Water Company \$500 per year for running water mains through the principal streets and furnishing water-plugs. The water company will probably accept the proposition.

OXFORD, N. C.—Our correspondent writes: "Our town is contemplating water-works by the spring. Mayor T. D. Crawford can give full information."

Springfield, O.—In answer to a request for information in regard to respective extensions in pipe-line here, our correspondent says: "We have contracted for about a mile of 6-inch pipe, which we will lay down in the spring; also, in the near future, expect to make extensions of about three miles in addition to the first named, but we are not yet ready to contract for same."

MONTGOMERY, ALA.—The question of establishing at once an efficient system of sewerage is being agitated and important developments may soon be expected.

Dalton, Ga.—W. II. Murdock writes us from this place as follows: "Some months since an election was held and the majority voted in favor of issuing \$40,000 of 5 per cent. bonds to build water-works. The bonds have not been placed, and nothing done. I am doing all in my power to have artesian wells sunk in sufficient number and capacity to supply the town."

KANSAS CITY, Mo.—Address City Engineer for details of proposed alterations in the Eighth Street Tunnel,

WIARTON, ONT.—Our correspondent writes: "The tender of Mr. John D. Ronalds, of Brussels, Ont., has been accepted, furnishing boiler, 3,400 feet of main iron pipes, 8 hydrants, hose and hose reel. Work to commence as soon as the frost is out of the ground, and to be compl ted and in good running order by the 15th of lune, 1888."

MILWAUKEE, WIS.—The Board of Public Works will expend for sewers \$273,050.

KENTLAND, IND. — Our correspondent writes: "The town of Kentland, Ind., on the 18th of November voted in favor of the erection of water-works and the issuing of the necessary bonds therefor. The Town Board has not taken any further steps in the matter, but will do so soon."

FORT BENTON, MONT.—Concerning water-works matters here our correspondent writes as follows: "Water-works are being put in. Pipes all laid, and engine-house under construction."

DOVER, N. H.—Our correspondent writes: "The citizens of Dover, on November 22, voted in favor of public water-works. It is now in the hands of the city government. Some action will be taken by them, probably this week, to forward the matter."

this week, to scrward the matter."

At a special meeting of the City Council held since, the issuing of \$275,000 of water bonds to provide for the construction of water-works was recommended and the bonds will probably be issued at once.

HILLSBORO, ILL. — Our correspondent writes: "Contract for water-works to be let January 12, 1888. Plans and specifications at clerk's office. W. R. Coats, Engineer. For information address George C. Bryce, City Clerk."

KEY WEST, FLA.—In answer to a question concerning a reported sewerage project for this city our correspondent writes as follows: "We have sent for George E. Waring. Jr., and when he comes he will submit plans, etc."

GRAFTON, W.VA.—Henry S. Wilson. Esq., writes from this place saying: "The town of Grafton has authorized me to make estimates and survey for water-works with the view of putting the same to a vote of the people at next election in March."

DEVIL'S LAKE, DAK.—Our correspondent writes: "The city will, within a short time, have an artesian well bored and would be pleased to hear from any firm in the well-boring business. We want to employ parties that can go 2,000 feet if necessary. The city will pay spot cash for all work contracted."

JERSEY CITY, N. J.—At a recent meeting of the Board of Public Works a sub-committee of the Committee of One Hundred of the Citizens' Association submitted a report on the water question. The report opposed the changing of the present water-supply, which it claimed was almost as good as Croton water. It advised the board not to enter into a contract with any private corporation. The report was filed.

DAYTON, KY.— This place is to have a system of water-works. A representative of the Mercer Water Co., of New York City, is to make an estimate of the number of miles of water-pipes to be used, and the cost of putting up the plant, and the probable amount of revenue to be derived; then a proposition will be made to Council accordingly. City Clerk Haywood can give information.

MOUNT STERLING, KY.—The water-works question is being agitated here.

BROOKSVILLE, FLA.—An artesian well is to be sunk here.

The second secon

SHELDON, ILL.—O. Ott can give details of a proposed system of water-works for this town. It is said that the works are to be erected by the Illinois Central Railroad Co.

WEST BRANCH, MICH.—Water-works will probably be established in this place.

FAIRHAVEN, MASS.—Joseph K. Nye can give information concerning a \$50,000 waterworks project for this place.

LEBANON, PA.—Additional mains are to be laid here, and the water-works system is also to be extended.

Missouri Valley, Iowa.—Our correspondent writes from here as follows: "There has been nothing done since my last letter except to appoint committees to investigate systems, etc."

ALTON, Mo.—Concerning a report that water-works were to be established here our correspondent writes as follows: "No water-works contemplated in this town."

Springfield, O.—Bids will soon be wanted here for 5,310 feet of water-pipe.

FERNANDINA, FLA.—This city has decided, by popular vote, to bond itself for waterworks, and important developments may be expected soon.

EUFAULA, ALA.—In reference to water-works matters here our correspondent writes: "The water-works are now being constructed, the stand-pipe being complete, and the mains are now being placed, and we expect them to be in successful operation by or before February, 1888. The contract was awarded to William D. Chapin and associates of Montgomery, Ala."

SANDWICH, MASS.—Concerning a reported water-works project here our correspondent writes as follows: "We apply to the Legislature this winter for a charter."

ACUSHNET, MASS.—This place is to be supplied with water from the New Bedford, Mass., water-works system. The work will not be begun until spring, though most of the pipe is to be purchased at once. About \$20,000 will be expended.

BRIDGES.

DUBLIN, GA.—On December 21 l aurens County will decide by vote whether or not to issue bonds in the sum of \$15,000 to place bridge over the Oconee River.

BROCKPORT, N. Y.—A small bridge is to be erected here.

HICKMAN, KY.—It is reported that a levee is to be built from this place to Tiptonville, a distance of about fourteen miles, at a cost of \$110,000.

WHEELING, W. VA.—Concerning a report that several bridges were to be erected here, our correspondent writes: "No positive action has been taken. Mr. Linch, acting for a Mr. Clarke, made a proposition which our board refused to accept. I'roposition was to give Clarke five years to build, and board would only give three, and subscribe \$300,000 to the capital stock of same."

BUFFALO, N.Y.—Our correspondent writes: "A bridge is to be built over Scajaquado Creek. Plans are ordered. Nothing further will be done until next year."

BRIDGEPORT, CONN.—The contract for the erection of the new lower bridge has been awarded to Dean & Westbrook, of New York, who represent the bridge building company, with works at Phœnixville, Pa. The contract price is \$67.500. The work of building the bridge will be commenced early next spring.

JACKSON, N. H.—The County Commissioners will build a bridge here.

GRAND FORKS, DAK.—A \$50,000 bridge will be erected here.

CAMDEN, S. C.—A bridge over the Catawba River is to be erected by the County Commissioners.

TAINTER, WIS .- A bridge is to be built

SELKIRK, MAN.—A bridge is to be erected here, over the Red River.

SANDLAKE, N. Y.—The town will build several bridges.

COLDEN, N. Y.—An iron bridge is to be constructed in this city.

GAS AND ELECTRIC-LIGHTING.

New Brunswick, N. J.—There is talk of starting an electric lighting plant here.

Union City, Tenn.—The question of electric lights is being agitated.

THE Roodhouse Electric and Power Company, Roodhouse, Ill., has been incorporated. Capital stock, \$5 000. Ellis Briggs and others, incorporators.

HOLLAND, MICH.—It is reported that this place will establish an electric-light plant.

EXETER, N. H.—Electric-lights are to take the place of gas here.

CHEYENNE, W. T.—This city is to have a Fahwehjelm incandescent gas-light plant, similar to the one in use in Chicago, 1!1.

NEW LEXINGTON, O.—A new electric-light company will establish a plant here.

MONTGOMERY. ALA.—The City Council has closed a contract with the Brush Electric-Light Company, of this city, to light the publics streets for a term of five years with 100 2,000 candle-power lights, at an annual cost of \$15,512.50.

HARTFORD. CONN.—The question of lighting the streets of this city with electricity is receiving the attention of the officials.

WILLIAMSPORT, PA.—Our correspondent says: "The contract for lighting the city with electric lights has been let to the Edison Arc-Light Co., of this city. Work will be commenced immediately after a decision is given by the City Solicitor in reference to the legality of act of Councils in letting the same by resolution, instead of by ordinance—the Lower Branch having let the same by ordinance to the Fort Wayne Jenny Electric-Light Company, and the Select Branch adding thereto a resolution giving it to the home Company."

NEVADA CITY, NEV.—A project is on foot to erect an electric-light tower 100 feet high at the Court-House in this place, from which four lamps of 2,000 candle-power each will be suspended.

STILLWATER, MINN.—A natural-gas shaft is to be sunk here.

SIOUX CITY, 10WA.—The Sioux City Light, Heat and Power Co. has been incorporated. Capital, \$100,000. Emerson McMillin, L. L. Kellogg, and others, incorporators.

LOUISVILLE, KY.—The Louisville Electric-Light Co. will make improvements to its plant.

RAILROADS, CANALS, ETC.

BIRMINGHAM, ALA.—A railroad tunnel under street crossing is to be built here. Address W. H. Hughes.

OAKLAND, CAL.—Walter Blair, Samuel Howe, and others are at the head of the Broadway, Berkeley and Piedmont Railway Co., to operate a street railway here. Eight miles of road will be built and over \$500,000 will be expended.

EL PASO, TEX.—A. M. Loomis can give details of proposed street railroad for this city.

ONEONTA, N. Y.—Address Alfred Morris for details of proposed street railway; \$20,000 is invested and to be used.

FLUSHING, N. Y.—Surveyors have begun operations on the street-car railroad which is to be established here. At the conclusion of their work it is probable that contracts will be let for the construction of the road. About ten miles of tracks are to be laid. For particulars address Supervisor Joseph Dykes, President Flushing and College Point Railway.

LITTLE ROCK, ARK.—Our correspondent writes: "A charter has been granted to the City Electric Railway Company to build and operate lines over several miles of streets in this city and suburbs. They propose to operate ordinary street railway cars and also a dummy line for the transfer of freight as well as passengers. Work will probably be commenced in January, 1888, and at least one mile built the coming spring. F. J. H. Rickon is engineer for the company."

BIDS OPENED.

ST. LOUIS, Mo.—Synopsis of bids for 300 tons cast-iron coated water-pipe, opened in this city December 5 by the Board of Public Improvements:

	8c tons re-inch water-pipe 19o tons re-inch water-pipe 25 tons 6-inch water-pipe		Quantities.		
	\$30.85 30.85 30.85	Price.			
\$9,255.00	\$2,622.25 5,861.50 771.25	Amount.	R. D. Wood & Co.		
	40		\$29.95 29.95 29.95		
\$8,985.00	\$2,<45.75 5,690.50 748.75	Amount.	Shickle, Harrison & Howard Iron Co.		
	\$36.70 36.70	Price.			
\$11,010.00	\$1,119.50 6,973.00 917.50	Amount.	Cincinnati and Newport Iron and Pipe Co.		

The contrict was awarded to the Shickle-Harrison & Howard Iron Co.

MILWAUKEE, WIS.—The Board of Public Works opened bids December 8 for constructing the flushing-tunnel. It will be 2,400 teet long and 12 feet in diameter. The contract will amount to about \$113,000:

Bidders.	Price per cubic yard for rock excavation.	Price per lineal foot for tunnel and gate shafts.
Ross & Onderdonk, New York W. T. Casgrain John O'Neill	\$8.00 7.00	\$68.00 59.50 57.00
John Angus, Ch.cago	16.75 3.00 12.00	55.00 48.50 47.25

The contract was let, on December 9, to William Forrestal, of Milwaukee. The tunnel will take 3,000,000 bricks and 12,000 barrels

PITTSBURG, PA.—No bids were received by Controller E S. Morrow for a mud-drum and stand-pipe, advertised to be opened Decem-

New Lexington, O.—The contract for the steam-heating apparatus, plumbing, and gas-fitting, with the iron-work, drainage, stone, wood and brick work, etc., etc., con-nected therewith, of the new court-house here, has been awarded by the Commissioners to Kelly & Co., of Columbus, O., at the sum of \$8,140.

ELIZABETH, N. J.—The Committee of the ELIZABETH, N. J.—I he Committee of the Common Council has awarded the contract for lighting the streets of this place to the New York and New Jersey Globe Gas-Light Co. for a term of one year at a cost of \$17 per lamp, the city reserving the right to cut off 100 lamps and substitute electricity at any time.

DULUTH. MINN. -- Council has granted franchise to the Electric-Light Company for ten years to furnish 100 20-candle-power lights at \$17.50 per light per year. The plant will be put in at once.

PHILADELPHIA, PA.—At the Gas Bureau bids for supplies for the ensuing year, exclusive of coal, which were opened last week, were opened on December 13. Bids had been were opened on December 13. Bids had been requested for about 7,000 gas-meters, varying in quantities from three lights to 300 lights each, and letters were received from the following firms: American Meter Co., the Goodwin Gas-Stove and Meter Co, and Helme & McIlhenny, who stated that they collectively would furnish meters at the following forms. collectively would furnish meters at the fol-

lowing prices:
Three-light meters, \$5.50 each; 5-light, \$7 each; 10-light, \$9; 20-light, \$12; 30-light, \$16; 45-light, \$23; 60-light, \$33; 100-light, \$55; 150-light, \$85; 200-light, \$120; and 300-light, \$205 each.

light, \$205 each.

This is a very great increase over the bids of last year, when the prices were: \$4.10, \$5.20, \$6.50, \$9, \$12.25, \$18, \$24.50, \$39, \$63, \$83, and \$150 respectively.

Director Wagner refused to award the contract, because of the apparent combination, and he declared he would readvertise for bids.

BOSTON, MASS. - Synopsis of bids for 420, BOSTON, MASS.—Synopsis of bids for 420,-000 feet, b. m., of kyanized spruce plank for Harvard Bridge, opened 1 ecember 10 by the Bridge Commissioners: W. S. Barker \$24,39 per 1,000 feet; A. M. Stitson & Co., \$26 50 per 1,000 feet. The contract was awarded to the lowest bidder.

MILWAUKEE, Wis.—Synopsis of bids for furnishing the House of Correction with 1,045,000 feet of hard-wood lumber. Cameron Bros.' bid of \$15,569.50 being the lowest will probably be accepted by the County Board. The other bidders were: C. H. Grenlich Bros. and J. H. McCarthy.

ISHPEMING, MICH.—The contract for build-ISHPEMING, MICH.—The contract for building the ore docks at Marquette and St. Ignace has been let to Thomas H. Hamilton of Toledo. Three docks at Marquette have a capacity of 18,000 tons, which will be increased to 33,000 tons. Additional docks at St. Ignace will hold 10,000 tons. The price is not made public, but it is said to be the largest single contract of the kind ever let. New docks will be built by the opening of navigation next spring.

HAMMOND, IND.—Synopsis of bids for construction of a system of water-works, opened December 12 by the City Trustees:

E. B. Wingate, Chrcago, III	Bidders.
\$4.125.00	Pump-house, chimney, and reservoir.
\$3,271.00 4,450.00 4,500.00	Pumps and boilers.
	Stand-pipe.
\$4,301.80 \$11,697.80 5,778.00 12,960.00 5,200.00 9,700.00	Total.

Contract awarded E. B. Wingate.

WINONA, MINN .- Council has awarded firealarm system contract to Gamewell Electric Light Co., for \$4 300, work to be done under the supervision of the City Engineer.

COLUMBUS, O.—The bids opened recently for the new water works engine ranged from \$56,000 to \$90,000.

ROSEDALE, KAN .- The Kansas City Bridge and Iron Company has been awarded the contract to construct a bridge here, to cost **\$33,440**.

POWHATAN, ARK. — Our correspondent writes: "The following named architects presented plans, etc., in competiton for the new Court-House to be erected here: C. G. Rosenplanter, Memphis, Tenn.; Orlopp & Kusener, Little Rock, Ark.; B. J. Bartlett, Little Rock, Ark.; A. Weiczorek, Little Rock, Ark.; D. A. McKinnda, Paducah, Ky. Those prepared by the last-named gentleman were accepted and adopted."

It is reported that Secretary Endicott has settled the controversy which has arisen in regard to the work of excavating the Harlem regard to the work of excavating the rather ship Canal, by awarding the contract for that work to John Satterlee, of Englewood, N. J., at his bid of 93 cents per cubic yard for material above water. and \$1.13 per cubic yard for material under water. The appropriation for this work amounts to \$400,000.

Item A includes spans I, 2, 3, 4, 5, 6, 7, 8, 9, 10, 13. 14, 15, 16, 17, 18, 19, 20 and 21, and the cantilever portions of spans II, 12 and 22.

Item B includes span 23 and all but the

and all but the cantilever portions of spans 11, 12 and 22.

Although the King Iron Bridge Company was the lowest bidders, the Commissioners, consisting of Mayor O'Brien, of Boston, Mayor Russell and Mr. Leander Greeley, of Cambridge, decided that in view of the expense of inspecting the work of the King Iron Bridge Company, at Cleveland, O., and in consideration of the foat that Boston and Combridge Company, at Cleveland, O., and in consideration of the fact that Boston and Cambridge mechanics would be benefited if the Boston Bridge Company was awarded the contract; the Commissioners agreed to award the contract to the Boston Bridge Company. The Commission on the Harvard Bridge was a special one, appointed by the Massachusetts Legislature, for the purpose of building a bridge between Cambridge and Boston, and it had a right to make any decision that a mabridge between Cambridge and Boston, and it had a right to make any decision that a majority of the Commissioners might agree to; if, however, the bridge had been exclusively within the control of the city of Boston, under existing ordinances, the city would have been obliged to award the contract to the lowest bidder, providing he had furnished a satisfactory bond. It is expected, but not guaranteed, that at least one-half the masonry piers of the bridge will be completed by September 1, 1888, and the balance by November 1, 1888. The iron contractor agrees to complete his work by December 1, 1888, but that time may be extended.

THE ENGINEERING & BUILDING RECORD

AND

THE SANITARY ENGINEER.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1887, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

Volume 17. Number 4.

Published every Saturday.

NEW YORK, DECEMBER 24, 1887.

LONDON, JANUARY 7, 1888.

SINGLE COPIES, TEN CENTS.

Subscription, \$4.00 per year in advance, post paid.

SINGLE COPIES, SIXPENCE.

Subscription, 20s. per annum in advance, post paid.

IN GREAT
BRITAIN.

THE ENGINEERING & BUILDING RECORD, conducted by Henry C. Meyer, is published every Saturday at 82 & 84 Fulton Street, New York. (P. O. Box 3037). Its opinions upon all technical subjects are either prepared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE.

Postage Paid.

OFFICE IN GREAT BRITAIN, 92 & 93 FLEET St., LONDON.

TERMS, 20s. PER YEAR, IN ADVANCE. Postage Paid.
SINGLE COPIES, SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of The Engineering & Building Record (New York), and crossed —— & Co.

Continental subscriptions are also received by F. A BROCKHAUS, Esq., Querstrasse 29, Leipzic, Germany, and Asher & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5. The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by check or money order payable to The Engineering & Building Record.

When a change of address is desired, both the old and new addresses should be given.

THE RAPID-TRANSIT PROBLEM IN NEW YORK.

In the brief comment in last week's issue on the communication from "Inter-Metropolitan" regarding the rapid-transit problem in this city, we stated that we welcomed the proposed Elm Street tunnel on the principle that "half a loaf is better than no bread." This has brought out a letter from an engineer who is familiar with the underground roads of London and the elevated viaduct roads of Berlin. In it he commends what he calls Mayor Hewitt's plan of a viaduct road on the east and west sides of the city. He says:

"The Mayor is right after all in what appears to be his factious opposition to the Elm Street improvement, for an underground road is not what is wanted in New York. If you go underground, you lose natural light and air, and no artificial means will ever make up the loss. One has only to use the London underground and the Berlin viaduct in the same week, so as to make fresh comparison, in order to appreciate this fully and remember it long. The ultimate solution of the rapid-transit problem must lie in two roads, one on the east side and one on the west, of solid masonry, at a height not less than 18 nor more than 50 feet above street grades, of strength to carry four tracks and 35 ton locomotives. Anything else will be a half-way measure, like the present affairs on stilts, which, in barely ten years, have outgrown their usefulness."

For the information of our correspondent, and those of our readers who may not be aware of the fact, we would say that this journal has advocated substantially this system for several years back, and our unwillingness to oppose an underground rapid-transit scheme was due solely to our appreciation of the imperative needs of further facilities for getting up and down town; and, as we stated, we had rather have "half a loat than no bread." In our issue of January 28, 1886, we stated in an editorial on this subject:

" It is certain that the requirements of rapid transit are not fulfilled by railroads on the surface of the ground, on which heavy motors, noisy in their operation, run at high speed, as they do in the suburbs of Boston, New York, and Philadelphia. They are not fulfilled by passenger cars, heated by coal stoves, and swept by a draught of cold air from a tilting transom over the end door, as is the barbarous custom on the Pennsylvania and Hudson River Railroads. They are not fulfilled by iron trestles built over public streets and too flimsily constructed to carry motors of sufficient power to draw the necessary loads and yet carrying machines which are so noisy in their operation as to be a frightful nuisance. Still less can the necessary conditions of comfort and health be fulfilled by any subterranean structure, such as is suggested for Broadway. We believe that the day is rapidly approaching when large cities will be traversed by viaducts constructed on property exclusively dedicated to that purpose, and on which trains of cars will be propelled at high speed through the open air by nearly noiseless motors, two tracks being devoted to long distance and two to short distance travel."

Capitalists who have hitherto furnished rapidtransit facilities for New York have wanted the inducement of being able to water the stock and make money in other ways than by carrying passengers. This has, no doubt, had the effect of making it a difficult matter to secure capital to build a road for the prospective earnings of capital honestly expended. We are inclined to believe that before money will become so cheap

in this country as to secure its employment in this legitimate way, this city's growth and prosperity will be retarded, unless the city itself undertakes the construction of these highways. We therefore look with favor on the suggestion attributed to Mayor Hewitt that the city now build at least one of these highways and lease it on fair terms to some corporation who will operate it for the convenience of the public and a reasonable return. The great cost of such an undertaking and its unquestioned value to the city, to say nothing of the compensation to be reasonably expected for the lease, would seem to make it quite as proper an object on which to expend the public funds as the widening or opening of a street or the construction of a bridge. Some provision, however, should be made that would insure the payment of the greater portion of the annual cost by the property owners of the upper part of the city, who will undoubtedly derive the greatest advantage.

MUNICIPAL BUILDING METHODS.

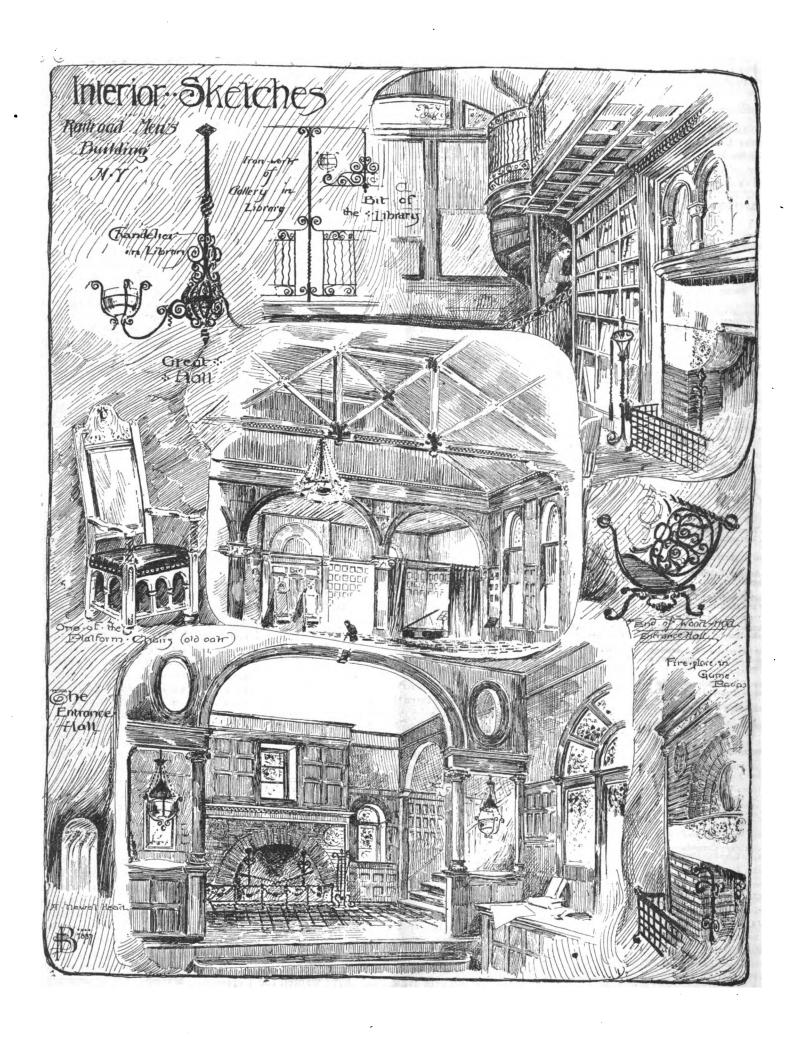

A RECENT editorial in the Syracuse Standard, discussing the architectural competition invited for the proposed additions to the New York City Hall, treats the whole matter so forcibly and well that we cannot refrain from giving our readers the benefit of some of it, as the principles enunciated apply to a much wider range of cases than the specific one that called it forth.

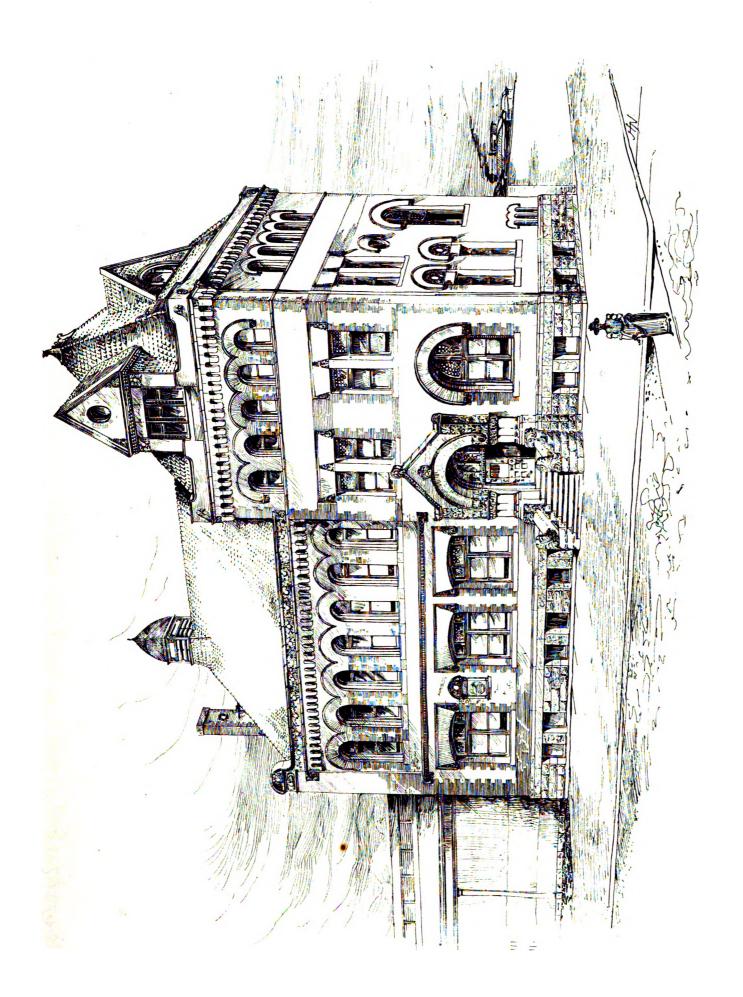

After a friendly notice of the views recently expressed in this journal on the same topic, the Standard goes on to say:

"It is the old story of beginning economy in building by employing a poor architect, for no good architect will have anything to do with a competition in which the best design is almost certain to be thrown out by the incompetent committees which usually manage big municipal or State jobs of building, and when, even if accepted, the recompense is inadequate to the expense. The truth is, that a first-rate architect can build a handsomer and more convenient structure for six million dollars than a fourth-class architect is able to build at all; but a public building committee, nine times out of ten, prefers to save a few thousand dollars on an architect, and expend from one hundred thousand dollars to millions of money in partially adapting an inherently bad building to purposes for which the architect apparently never intended it."

This, unhappily, has been too often illustrated in New York City to require any further comment from us, and New York's shortcomings in this respect are brought out in even stronger light by our contemporary by contrast with the more sensible methods pursued by her sister city up the river:

"Albany, when she built a City Hall, went to work precisely as a gentleman of wealth and taste proceeds when he purposes the erection of a house. He gives to the best architect he can find an idea of the purposes and general character of his future residence, together with an estimate of its cost, and leaves the details to the architect. That is a sufficiently simple plan, and by it the best results are accomplished. In the construction of municipal and State buildings it is as well to give all architects an opportunity to compete for the commission of furnishing plans, but prizes of sufficient size to compensate the best architects for their trouble should always be offered, and the building committees, contrary to custom, should be composed of gentlemen who know the difference between the Stonehenge and the Renaissance style of architecture. The ignorance of building committees is proverbially colossal, and would be ridiculous were it not sinful."

THE ENGINEERING & BUILDING RECORD ILLUSTRATED SERIES.

RAILROAD MEN'S BUILDING, NEW YORK.

It is earnestly to be hoped that the committee having this matter in charge will realize the greatness of their opportunity and be inspired thereby to take adequate means to fully and satisfactorily accomplish their task, for, to quote again from our Syracuse contemporary,

"New York will soon be the greatest city in the world, and it must always remain the metropolis of the Western hemisphere. Its new City Hall will last for several hundred years, unless it tumbles in, or future generations become ashamed of it and tear it down. There is enough architectural talent in New York City to construct a splendid building that shall be a worthy monument to this rich and progressive generation. Instead, the city is quite as likely to have an unsightly pile of stone and iron as badly adapted to the uses of a municipal building as the genius of ignorance and bad taste can make it. If Mayor Hewitt were always as wise as he sometimes is, he would not sanction the present system of competition among fourth-class architects for the construction of the worst possible building at the greatest possible expense."

THE THIRD ANNUAL EXHIBITION OF THE NEW YORK ARCHITECTURAL LEAGUE.

THIS exhibition was opened on Saturday evening, December 17, with a reception to Mr. Richard M. Hunt, the newly elected President of the American Institute of Architects.

The rooms, at the Fifth Avenue Art Galleries, 366 Fifth Avenue, were crowded all the evening by members and their friends, making of the reception a most brilliant success. The private view was quite a secondary matter, seeming merely an opportunity embraced by the League to express its respect for and do honor to the guest of the occasion.

The rooms, three in number, are used for this exhibition for the first time and are exceedingly well adapted to their purpose.

The first and second rooms, after entering, are devoted to the display of purely architectural work, while the third contains the work in the allied arts—viz., decorative sculpture, decorative painting and design, tapestries, leather and metal work, inlay, and all that goes to the fitting and furnishing of the interior.

In the first room, at the right on entering, are the forty-three designs submitted in competition for the gold and silver medals, which have already been noticed in these columns. The jury of award announced the names of the winners at the reception. The gold medal to James A. McLeod, of Minneapolis, Minn.; the silver medal to W. B. Mundie, of Chicago, Ill., and honorable mention to Julius Harder, 237 Broadway, New York City, William C. Noland, 212 South Third Street, Philadelphia, and Timothy F. Walsh, Cambridge, Mass.

It will be noticed that but one of the selected designs is from New York, while both the medals have gone to the West.

Almost all of the south wall of this first room is given up to the beautiful drawings of the great Hotel Ponce de Leon, at St. Augustine, Fla., by Carrere & Hastings, architects. The drawings, in both pen and ink and water color, are by Blum, Rosenberg, and Bucher. In this room also may be noted No. 300, a very clever etching of Trinity Church, this city, from Trinity Place, by Henry S. Ihnen; No. 267, model in plaster of the salon in house for G. J. McGourkey, in this city, by John H. Duncan, architect: the absence of color on the plaster is to be regretted. No. 284, Sanitary Geography, by Edward Potter, a very queer drawing, with several yards of text attached. the whole meaning something which "no fellow has been able to find out;" No. 277, two photographs of the interior of William F. Weld's beautiful house at Brookline, Mass., by E. M. Wheelright. It is a pity that they were not colored drawings.

Going into the second room, which contains the greater number of the architectural drawings, one is immediately struck by the comparative absence of representations of work of any magnitude. With the exception of No. 204, an unsatisfactory drawing of the not very satisfactory tower for the new Madison Square Garden, by McKim, Mead & White, No. 197, the New York Life Insurance Company's building in Kansas City, by the same architects, the same company's building in Montreal, by Babb, Cook & Willard, and a few large country houses, the rest of the drawings are of small and comparatively unimportant work. This, without doubt, will strike the

unprofessional observer; but it is to be accounted for by the actual unimportance of the work of the past year.

At the entrance to this second room, on a stand by the door, is a very interesting and curious drawing, No. 314 A. This is the original suggestion of George Washington to his architect for the design of Mount Vernon; drawn by George Washington and loaned by Mr. S. L. M. Barlow. On the back of the sketch is this note: "If this plan should be adopted the doorway here marked need not (as the hall is already built) be cut now—it may be cut hereafter."

About the entrance to this room is the series of beautiful drawings, Nos. 1-33, of the English cathedrals. These are by Joseph Pennell, and loaned by the Century Company, and are in pen and ink and *gouache*, and most excellent examples of this mode of rendering architectural subjects.

Nos. 33 and 37 are lovely color drawings of Moorish Interiors, by Louis Tiffany. No. 43 a clever church at Saratoga, by A. Page Brown. No. 47 a beautiful penand-ink drawing. by Henry New, of W. D. Sloan's house at Lenox, loaned by The Engineering and Building Record. No. 59 is a most surprising drawing of "A Garden House," by E. L. Wakeman, which was evidently hung to fill a space. It had better been hung with its face to the wall.

No. 88 is a beautiful drawing in color of a Venetian palace, by S. W. Meade. The delicacy and charm of this is admirable.

. John H. Duncan has, in No. 99, a clever drawing, in color, by C. S. Luce, of his house for G. J. McGourkey.

No. 121 is a large pen-and-ink drawing, by W. C. Hazlett, of the Orange Heights Hotel, by Arthur D. Pickering. The design is very fine—a great simple stone building, flanked by two massive towers, the whole rising from a sheer rocky wall, the entrances being supposably from the other side.

The post of honor in this room has been given to some drawings made by Richard M. Hunt when he was a student at the Ecole des Beaux Arts and drawing in the atelier of M. Lefeul. Chief among these is a series done for the French architect when he was completing the Pavilion de la Bibliothéque of the Louvre, begun by Visconti. The others are drawings in a competition Ecole projet.

Just to the right of these are some very interesting drawings by John Ruskin and J. M. W. Turner, loaned by Charles Eliot Norton. One of the Ruskins, No. 170, a part of St. Mark's, Venice, is in the master's best style.

No. 184 is a drawing in pen and ink, by Charles McKim, of McKim, Mead & White's design for the Cambridge Library. It is a very beautiful and delicate drawing of a charmingly quiet and dignified design.

No. 217 is a lovely drawing, by Prentice Treadwell, of Bruce Price's design for the great hall in the house of F. W. Sharon, in California. Mr. Treadwell also has several other drawings of interior subjects, all of which are in excellent color.

C. Howard Walker shows two very nice color drawings of his church at Springfield, Mass.

Bruce Price has a fine pen-and-ink drawing of a house at Tuxedo in No. 86, and another in "Stone Acre," Newport.

Mr. Luce has some of his charming water-colors in No. 135, a cottage at Jamestown, and also in some drawings he has made for George Martin Huss.

Drawings by W. M. Kendall, Wilson Eyre, Jr., Rossiter & Wright, A. W. Brunner, C. I. Berg, W. C. Hazlett, Cass Gilbert, J. A. Schweinfurth, Rotch & Tilden, are also worthy of note.

It is surprising, and somewhat disappointing, that the profession outside of New York is so slightly represented. With the exception of half a dozen from Chicago and St. Paul, the same number from Boston, a few from Philadelphia and a handful scattering, the exhibition is entirely from this city. It is a pity it is so, since the League, though local in its voting membership, is open to all persons interested in architecture or the allied arts, and would gladly receive, and in fact seeks, for contributions to its annual exhibition.

The loan collection, which has been under the immediate care of Messrs. John Gellatly, H. O. Avery, and Frederick Crowninshield, is in the third room, and a very beautiful and instructive collection it is. The position of honor is given to Mr. St. Gaudens' plaster bas-relief of the late H. W. Bellows, D. D. This sculptor also exhibits the

Schiff children, while Mr. Hartly has his bas-relief of Lincoln.

The Associated Artists show several tapestries from designs by Dora Wheeler. "Penelope" is exceedingly nice. Some of the others are not. Mr. John La Farge shows a series of sketches for windows and studies for figures in windows, together with some Japanese views, all in most lovely color. Mr. T. W. Dewing has his exquisite figure of "The Symbolic Angel." Mr. F. S. Church is represented by several of his poetical works loaned by John Gellatly. One of these has a most interesting carved Italian frame.

W. H. Low's fine series of drawings illustrating Keat's "Odes and Sonnets" are most exquisite in their delicate drawing.

There are also some fine stamped and embossed leathers and leather-work loaned by Yandell & Co., which, together with inlaid work, painted panels—those by Jac. Gallaud, fils. are very nice—embroidered stuffs, from the Associated Artists and the Society of Decorative Art, wrought iron and brass, etc., etc., making a very gorgeous show.

As a whole, the exhibition is the best we have yet had in this country. What the architectural part of it lacks in interest it more than makes up in size.

There is, perhaps, a little want of plan in hanging, but that is more than counterbalanced by the effect that has been obtained.

THE NEW YORK ASSOCIATION FOR IMPROV-ING THE CONDITION OF THE POOR, AND THE HOSPITAL SATURDAY AND SUNDAY ASSOCIATION.

THE fourty-fourth annual report of the New York Association for Improving the Condition of the Poor opportunely makes its appearance at this time when charitably disposed persons are considering the mediums through which their gifts may do the most good to the deserving poor. The economy and intelligence with which this society's affairs are managed entitle it to a liberal support.

It is gratifying to note their commendation of the efforts of the Health Department under the presidency of Mr. Bayles to improve the character of the tenement-houses. We advise all persons interested to send for a copy of this report to John Bowne, 79 Fourth Avenue, New York City.

The Hospital Saturday and Sunday Association also reminds the public that the time is approaching for taking up their annual collections in behalf of the hospitals of New York City. Last year's collections in churches of all denominations amounted to \$33,784.66, and from trades, professions, and other sources \$20,267. During the past year the hospitals assisted by this association cared for 13,920 bed patients of whom 10,157 were free patients, besides operating upon or giving medical aid to 119,124 free dispensary patients. Persons who recognize the value of the work of our hospitals will do well to place their donation in the hands of this association.

OUR ARCHITECTURAL ILLUSTRATIONS.

RAILROAD MEN'S BUILDING, NEW YORK.—R. H. ROBERT-SON AND A. J. MANNING, ARCHITECTS.

THE Railroad Men's Reading-Room, shown this week in our special and detail illustrations, in this city, was built by Mr. Cornelius Vanderbilt for the use of the operatives of the New York Central Railroad.

The building consists of two distinct portions, a corner pavilion on Forty-fifth Street and Madison Avenue, and a wing facing upon Madison Avenue. The first division includes a gymnasium in the basement; on the first floor, the entrance-hall, offices, and staircase: on the second, class-rooms; and above this the janitor's apartments. The basement plan of the wing shows the various baths, the water-closets, and the boiler-room. Over these are the social-room, reading-room, and the library, and beneath the roof of the wing is the great hall.

The roofs are covered with dark-toned red tile. The walls are built of yellowish mottled brick. The principal

The roofs are covered with dark-toned red tile. The walls are built of yellowish mottled brick. The principal angles, the circular heads and jambs of doors and windows and the sill-courses are laid in red brick. Terracotta is extensively used for cornices, raking courses, panels, crestings, finials, and at arch imposts. The interior is finished in hard wood.

The special domestic engineering features of this building are discussed elsewhere.

The architects were Messrs. R. H. Robertson and A. J. Manning, of this city.

INTERIOR OF RAILROAD MEN'S BUILDING.

BUILDERS' AND CONTRACTORS' ENGINEER-ING AND PLANT.

No XXVIII

(Continued from page 42.)

HEAD-HOUSE ON THE NEW CROTON AQUEDUCT AT SHAFT 22.

In a previous article we have given a description of plant and its location relative to the shafts, and will now illustrate and describe a head-house, built over a shaft, in which the appliances are located for transmitting down the shaft the power which has been generated in the plant, so as to facilitate the discharge of material excavated in the headings, and to receive all building material required for constructing the tunnel which is delivered for that purpose.

The frame of this head-house is secured by the ordinary mortise and tenon joint, in connection with iron bolts (that are three-quarters of an inch in diameter) at points indicated in the illustrations.

This head-house is constructed in the form of a parallelogram, the dimensions of the exterior being 19 feet 6 inches by 10 feet, and the ground plan of the sills is shown in Fig. 1. At a a short posts are indicated, to which one end of the cross-beams h h are bolted, forming part of the support for three platforms, i, i and j, to be hereafter described, which can be seen in Figs. 2 and 3.

In Figs. 1 and 2 b b represent the guide-posts and guides; the latter, being shown in black, are bolted to the guide-posts, both extending from bottom of tunnel to the plates of head-house. The guide-posts on one side are 6x12 inches, but on opposite side, where they are secured to a 12x12-inch timber forming part of the frame, the guide-posts are 3x10 inches. The guide is 2½x3 inches and fits in a groove provided in the sides of cage-frame, thus compelling the cage to move at all times in a vertical position. On these cages the employees as well as all material from excavation in the tunnel or for construction are transferred either down or up the shaft as circumstances may require.

In Fig. 1 c c represent the galvanized sheet-iron pipes, 12 inches in diameter, used as a conduit from blower to supply fresh air to the tunnel or to draw foul air from it. At d the location of compressed-air pipe, 5 inches in diameter, is given, and at e the discharge-pipe from pumps located by the sump at foot of shaft. The black circle between d and e indicates the steam-pipe that delivers the steam to operate the pumps, and f shows the electric-light wires.

Figure 3 represents a side elevation and Fig. 2 a sectional view of head-house. The plates k are similar in

FIGURE 2.

plan and detail of construction as the sills, the only difference being that the posts a a only extend to tipple platform and therefore have no connection with the plates.

The plan of the tipple platform i was illustrated and described on page 291 of Vol. 16, and, therefore, it is unnecessary to repeat description here. Tipple platforms similar in plan were built at each end of the head-house and are both utilized when a full force is working in the headings.

The braces l/l are composed of 6x8-inch timber and extend from sill to plate, let into the posts m m six inches, and made flush with them. These braces are securely bolted to posts n, m m, and g g by iron bolts three-quarters of an inch in diameter. The opposite side of frame corresponds in details of construction. Small angle braces 6x6 inches, indicated at o in Fig. 2, are placed at each end to protect the two end bents from lateral motion.

The posts g g, Fig. 3, are braced as shown in Fig. 2. The braces are bolted where they cross each other and bolted also at top and bottom to the posts against which they rest. These braces, extending as they do from top to bottom of the head-house frame, firmly secures this frame from any possible cross strains that it may be called upon to resist.

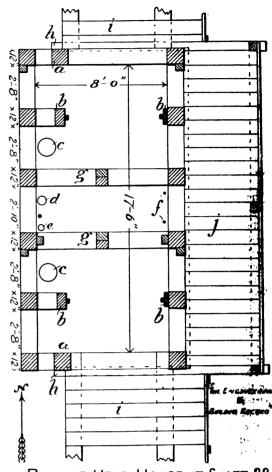

The longitudinal strains are also equally well provided for by the braces l, also extending from sills to plates, and bolted at centres to the posts m, and the ends to posts n and g g.

The Otis hoisting-engine used at this shaft to operate the cages is located at the northerly end, and about twenty-eight feet distant, the wire ropes r and s extending to it. A plan of the relative position of the hoist to shaft was given on page 676, Vol. 16, to which the reader is referred. To further secure the frame of head-house from longitudinal strains in operating the cages, as the maximum strains will be in the direction of the hoistengines, additional braces, indicated at p, have been placed at the northerly end, firmly secured to top of frame and anchored in the ground about twenty-two feet from sill of head-house. There are two of these braces, one at each corner at end of frame, eight feet apart, but distance between them diminishes to five feet at end of tipple platform. The windlass w, used in operating the tipple, is attached to these braces, as the height is convenient for that purpose, but the windlass on the platform at southerly end of head-house is supported on vertical standards.

The sheaves t, u, and v rest on 12-inch timbers, shown at y in Fig. 3 and in section at Fig. 2. These timbers are securely bolted to frame by 1 $\frac{1}{2}$ -inch rods, indicated by dotted lines x at seven different points in Fig. 3.

A careful inspection of Figs. 2 and 3 will show the

detail of the roof sufficiently clearly, therefore making a detailed description unnecessary. The roof projects beyond the frame three feet at each end, thereby increasing the protection to the mechanical appliances in the head-house from northerly and southerly storms. The sides of the frame are covered with boards laid in a horizontal position.

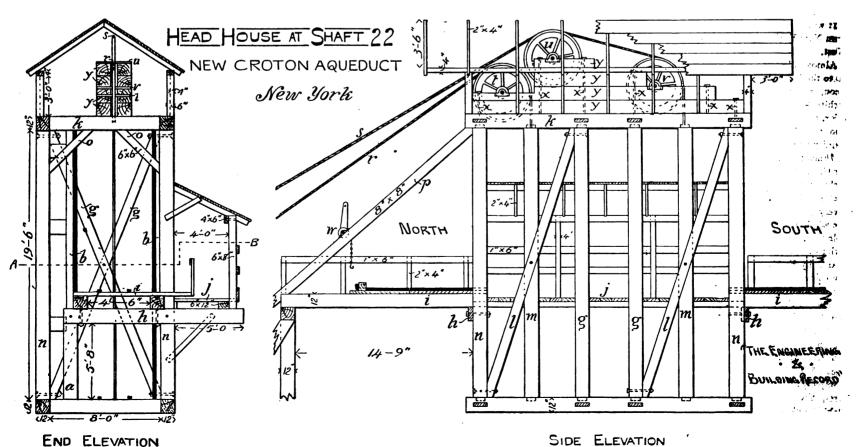

PLAN OF HEAD-HOUSE AT SHAFT 22

• TAKEN ON LINE A-B •

Fig. 1.

The corner standards resting on the plates supporting the roof are 4x6 inches, but the intermediate standards are 2x4 inches, all being capped by a scantling 4x6 inches on which the rafters rest, but the latter are 2x4 inches.

The platform extending the entire length of headhouse indicated at j in the longitudinal view, Fig. 3, in

SIDE ELEVATION FIGURE 3.

plan Fig. 1, and in section Fig. 2, is intended for the use of the man who operates the cages, as the Otis hoist is controlled by a hand rope the same as an ordinary elevator. This platform is accessible by a flight of steps, which can be located at any convenient point.

(To BE CONTINUED.)

PAVEMENTS AND STREET RAILROADS. No. XXII.

(Continued from page 37.)

SPECIFICATION FOR WOOD PAVEMENT, PARISH OF ST. GEORGE. *

The specification given below is one of the best recently written for wood pavements in London. Among the things to be noted are: the requirement of a space next each curb to allow for expansion; The requirement that the contractor give his own levels, etc., and making him responsible for their accuracy; the six months' maintenance without charge; the repair by the contractor of all openings in the street, at a fixed price per yard; the sweeping and cleaning of footways during progress of the work; and, lastly, that the contractor shall be present "whenever required, for the purpose of measuring and ascertaining the quantity of work performed," or else that he shall accept the measurement then made by the surveyor.

PARISH OF ST. GEORGE, HANOVER SQUARE, LONDON.

- Specification for Paving with Wood the Carriageways of Buckingham Palace Road (from the Grosvenor Hotel to Ebury Bridge), Conduit Street, Half-Moon Street, Pimlico Road, Queen Street, and Wilton Road, —George Livingston, Surveyor.
- 1. Description of pavement and mode of laying.—The pavement is to be composed of creosoted blocks, cut from the best yellow deal of first quality, 9 inches, 8 inches, and 7 inches long by 6 inches deep and 3 inches wide; no block to be more than 9 inches nor less than 7 inches in length. Each block to be cut perfectly true in size and shape. The joints to be filled in with mastic asphalt of approved quality to a height of at least $\frac{1}{2}$ 4 of an inch, measured from the bottom of the block, the rest to be filled in with Portland cement grouting, and no joint to be more than $\frac{1}{2}$ 6 of an inch in width. The blocks laid transversely are to be only laid to within 3 inches of the curb on each side of the street (to allow for expansion), the space so left to be filled in with Portland cement and sand, as shall be directed, but subsequently made good with blocks if necessary. No paving to be commenced on any portion of the foundation until six clear days after the concrete has been laid.
- 2. Creosoted blocks.—The whole of the blocks used in the work to be creosoted to a mixture of pure creosote, G. oil, and pure distilled tar, in proper proportions as shall be approved, but no blocks shall undergo this process until they have been first inspected and approved of by the surveyor, or other authorized officer; and the surveyor shall have full power, notwithstanding such inspection, to split in two any reasonable number of blocks selected indiscriminately from those brought on to the works, and to reject any that he may consider unfit for use; the same to be at once removed by the contractor.
- 3. Excavation.—The contractor to excavate the whole of the present macadamized roadways to the required depth to form foundation and pavement, such of the old macadam as the surveyor shall approve, if sifted and mixed with Thames ballast, to be used for concrete; the surplus to be the property of the contractor, who shall at once remove the same at his own cost.
- 4. Cement.—The whole of the cement supplied for the works must be of the best quality, and from an approved manufacturer, and must conform to the usual tests to the satisfaction of the surveyor.
- 5. Concrete. The concrete to be composed of Thames ballast (mixed with such of the old macadam and in such proportions as the surveyor shall approve) in the proportion of 7 parts by measure of hard core to 1 part by measure of cement; the surface to be finished off to a smooth face with concrete 1 inch in depth, composed of Thames sand and Portland cement, in the proportions of 3 of sand to 1 of cement, and to be laid a depth of not less than 6 inches over the whole area of the street (from curb to curb), and to be composed of the best Portland cement, subject in every respect to the approval of the surveyor.
- 6. Old paving stone.—All the paving stones in channels and crossings, etc., to remain the property of the vestry, at whose expense they will be taken up and removed.

GENERAL CONDITIONS.

- 7. Contractor to provide all materials, labor, tools, etc.— The contractor shall provide all materials, labor, tools, tackle, implements, etc., for the proper execution of the works. All the materials used to be the best of their respective kinds, and applied in the most workmanlike and substantial manner possible, and to the entire satisfaction
- * This pavement mentioned in the specification was laid in two contracts at prices respectively of 8s. and 8s. 2d. per square yard.
- † The surveyor considers that all blocks should be creosoted under a pressure of 10 to 12 pounds per super foot.

- of the surveyor. The blocks shall be of the best yellow deal, of first quality, and the surveyor shall have full power to reject any materials which he may consider unfit to be used in the work.
- 8. Setting out.—The contractor to set out and keep correct the works in every particular according to directions he may receive from time to time, and to be responsible for the correctness of the same throughout the whole term of the contract.
- 9. Maintenance after completion.—The contractor is at his own expense, and without charge to the vestry, to maintain the wood pavements, together with their foundations, in a state of perfect repair to the satisfaction of the surveyor to the vestry, for a period of six months from the date of completion of the entire work.
- 10. Maintenance by the Vestry.—Should the vestry determine itself to maintain and repair the pavement of any or all of the streets at the expiration of the period during which the contractor is to keep it in repair free of charge, he is to be bound, if so required by the vestry, to execute such repairs as he may be called upon to make at a price per superficial yard to be hereafter agreed upon. In all cases the old materials are to become the property of the contractor, and to be carted away by him without expense to the vestry.
- ontractor is, during the term of his contract, and at any time after its expiration, if so required, to repair, within twenty-four hours after notice, all damage done to the pavement by, or in consequence of, the operations of gas or water companies, or other public or private bodies, or by the vestry itself, and he is to do the work for such companies, or others, at a price per superficial yard (to be stated in his tender) measured as repaired. All old materials to become the property of the contractor, and to be removed by him at his own expense.
- removed by him at his own expense.

 12. Cleaning and sanding surface.—The vestry is to be at liberty to cleanse the pavement with water or by sweeping or scraping either by hand or by machines or in any other way it may be deemed expedient, and may also strew the surface with fine sand, gravel or other materials with a view to prevent slipperiness, and the contractor is to have no claim for increased wear of the pavement should it result from the usage of such material, or from any mode adopted for cleaning the surface.
- 13. Fencing, watching, and lighting.—The works are to be carefully fenced, watched, and lighted, during their progress, both by day and night, by the contractor at his own expense.
- 14. Footways to be kept clean.—The contractor is to sweep and keep clean footways from ballast or any other material, so far as may be practicable during the execution of the works.
- 15. Injury to curbs and footways.—Should any portion of the curb stones or footway pavements be injured or displaced by the contractor's workmen, they are to be reinstated at the contractor's cost by the workmen of the vestry, and such cost may be deducted from any sums then due or that may become due to the contractor.
- 16. Injury to sewer, gas, or water mains.—Should any injury be done either to the sewers or their appliances, or to gas or water pipes or their appliances, by the contractor's workmen, the damage is to be made good at the contractor's expense, and the cost thereof may be deducted from any money then due, or that may become due to the contractor.
- 17. Refixing gas and water boxes at altered levels.

 The parish workmen will raise or lower as may be required all water or gas boxes, gully grates, manhole covers, etc., to suit the new pavement at the expense of the vestry.
- 18. Dismissal of workmen for misconduct.—The contractor is to dismiss from the work any agents, workmen, laborers or others in his employ for misconduct, if required to do so by the surveyor.
- 19. Services of notices upon contractors.—All notices to the contractor, his foreman or agents, shall be deemed to be duly served upon him by their being delivered personally to any of his agents, or sent by post to his offices for the time being; and notice of such offices or the contractor's address is to be left with the surveyor to the vestry.
- 20. Works to be executed as the surveyor directs.—The work is to be executed in such manner, lengthwise and widthwise of the streets, and at such times as the surveyor may direct, and be carried on in such a way as will least impede the business of the neighborhood and the public traffic, and so as not to obstruct or endanger passengers, animals, or vehicles more than may be absolutely necessary.
- animals, or venicles more than may be absolutely necessary.

 21. Works to be done to the satisfaction of surveyor.—

 All work is to be executed and maintained throughout the contract to the satisfaction of the surveyor to the vestry for the time being, whose directions as to the work required and manner of performing the work are to be abided by; and his opinion on all points, both as regards execution and maintenance, and as to the moneys due to the contractor, shall be binding, final, and conclusive
- 22. Clerk of Works, etc.—The contractor is to obey the instructions given him by the clerk of works to the vestry, the surveyor's assistants, or other competent persons who may be deputed by the surveyor to superintend any part of the works.
- 23. Contractor to re-execute improper work.—If any part of the work shall at any time, in the opinion of the sur-

- veyor, be imperfectly executed, the contractor is, at his own expense, on the requisition in writing of the surveyor, to remove the same and replace it with good sound work to the satisfaction of the surveyor.
- 24. Upon neglect to re-execute work.—Should the contractor, for the space of forty-eight hours after receiving instructions from the surveyor, neglect or refuse to execute or amend any of the work which he may have improperly executed, or should fail to complete the work in time, or to maintain the work properly during the contract term, the vestry shall have full power to execute the work themselves, by their own workmen, or agents, and deduct all expenses incurred from any moneys that may be due or become due to the contractor, or may recover the same as the law directs.
- 25. Contractor responsible for accidents and losses to the Vestry.—The contractor, during the whole term of his contract, shall be held responsible for all accidents which may take place by reason of his works, or for want of repair in the pavement which he may undertake to maintain, whether notice of need of repair shall have been given to him or not; or for delay in executing repairs over openings made by the vestry, or others, after due notice has been given to him to make such repairs; and he shall indemnify and hold the vestry, and its officers, harmless against all actions, claims, compensations, losses, costs, and charges whatsoever in respect of the paving works, or anything arising out of the contract. And the vestry shall have full power to deduct the amount of such costs, losses, etc., accruing or arising out of such accidents and compensation, or from any defect or omission on the part of the contractor in maintaining the pavement in a suitable condition, or performing the repairs in a suitable manner, and the vestry shall further have power to recover such amounts from the contractor as the law may direct.
- 26. Time of completion.—The contractor is to complete and finish the work according to the provisions and true intent and meaning of this specification, fit and ready for public traffic, within the following time from receiving the order from the surveyor to commence the work—viz.: Buckingham Palace Road, within eight weeks; Conduit Street, within four weeks: Half-Moon Street, within three weeks; Pimlico Road, within four weeks; Queen Street, within two weeks; and Wilton Road, within three weeks. And the contractor shall forfeit the sum of £5 per day by way of liquidated damages for any delay beyond the specified time and the vestry may deduct the same from any moneys that may be then due, or become due to the contractor; but should the contractor be unable, owing to bad weather or other unavoidable causes, to proceed with the works, then such extension of time may be granted as the surveyor may think fit and reasonable.
- 27. Measurement of work.—Upon the completion of the work, the contractor, by his agent or foreman, is from time to time, whenever so required by the surveyor, to attend at such time and place as shall be named by him for the purpose of measuring and ascertaining the quantity of the work performed, and in default thereof, the surveyor shall be at liberty forthwith to measure and ascertain the quantity himself, and his decision as to the quantity shall be final, binding, and conclusive upon all parties.
- 28. Payment.—No payment shall be made by the vestry to the contractor for any work done or materials brought upon the ground until the surveyor shall have certified in writing that the work is completed according to the provisions of this specification, and to his entire satisfaction.
- 29. Mode of payment.—The following payments will be made upon the work when certified by the surveyor: 90 per cent. of the total amount one month after the completion of the work, the remaining 10 per cent. at the expiration of the contract—namely, six months from the date of completion of the work.
- 30. Sureties.—The contractor will have to provide sureties (in such amount as the vestry may consider necessary) for the due fulfillment of the contract.
- 31. Tender not necessarily accepted.—The vestry does not bind itself to accept the lowest or any tender, and reserves to itself the power to give the whole or any portion of the work to any one or more parties tendering, and to increase or diminish the quantity of pavement to be executed under this contract, without in any way invalidating the same.
- 32. The contractor may tender for any or all of the streets mentioned, and state in his tender a separate price per yard for each street, or he may state one uniform price per yard at which he is willing to undertake any or all of them.

Note.—The works will be commenced and proceeded with at once. Each street to be completed within the limit of the time separately specified, but the whole of the streets included in the contract must be completed within a period of nine weeks from the date of the commencement of any one of them

ment of any one of them.

The contract to be drawn up by the Parish Solicitor at a cost to the contractor not exceeding £5.

February, 1886.

One guinea is charged for this specification and form of tender, which will be returned on receipt of a bona fide tender.

The pavement called for in these specifications is the "improved wood" pavement, and in October following their issue, Mr. Livingstone reports on the comparative

expense attending macadam pavement on Piccadilly, and proposed improved wood pavement on Knightsbridge. The average amount of broken granite used per year for five years on 8,577 square yards of surface was 1,090 tons, costing for freight, carting, labor, rolling, watchmen, etc., 2s. 81/2d. per square yard; and for the future he estimates it would be on Knightsbridge 3s. per yard.*

Cleansing macadam in Piccadilly costs an average of 10d. per square yard per annum. For Knightsbridge it would be two cart-loads of sweepings a day in dry weather, and ten loads in wet weather; and as statistics show wet days for one-half the year, there would be 1,872 loads at 4s, per load, or a cost of 11d. per square yard per annum on 8.218 yards. For wood, the estimate is 3d, per square yard.

Including cleansing, watering, maintenance, and a proportional part of first cost and interest divided over fifteen years, he estimates a saving in the use of wood over macadam of about 1s. per yard per year.

The wood pavement can be contracted for at 3s. per square yard for first cost and maintenance for fifteen years.

(To be continued.)

DRAINING AND FILLING WATER-MAINS.

WHENEVER a water-main is extended or a new main laid connecting with the pipes already in service, it becomes necessary to empty the old main. In case of repairs, also, it often is necessary to draw off the water. In large and growing cities these cases are of such frequent occurrence as to demand due consideration in planning the water-pipe system and its extensions.

During the past year, for example, there were 621 "shut-offs" made in St. Louis for various purposes.

Large mains can generally be spared from service, but Large mains can generally be spared from service, but a few hours at most, and that only at considerable risk. In such cases it is of the greatest importance that we make such arrangement as to permit us, without fear of accident or delay, to drain the pipes, make the required connection or repairs, and fill the pipes again ready for service in the shortest possible time.

That this may be done, the first requisite is a dry point of operations. A small stream of water from a leaky stop-valve will greatly delay the work, necessitating more or less men constantly at the hand-nump or baling-

stop-valve will greatly delay the work, necessitating more or less men constantly at the hand-pump or baling-buckets, and perhaps causing caving in of the trenchanks or blowing hot lead out of the joints with the steam produced. Even tight valves will not be satisfying if we have to wait while the pipe is being pumped out before commencing the work proper, and then proceed with setting the pipes or castings in a hole lined with soft and sticky mud, ankle deep. The pipe should, whenever possible, be emptied at some point removed from the locus of the desired repairs or connection. of the desired repairs or connection.

The best arrangement for discharging the water from the main is a blow-off valve at each low point in the main

The best arrangement for discharging the water from the main is a blow-off valve at each low point in the main emptying into a sewer below.

It may be well to say in passing that the blow-off pipe should be so arranged that the stream of water from it can be seen, and thus leaks may be detected and the condition of the stop-valves during a "shut-off" may be observed. It may also be remarked that a blow-off valve should be of the best possible construction for durability and tightness, so that after being left without opening for twenty years it will work as perfectly as when new.‡

Where sewers are not available, if the streets have sufficient fall to them, a large part of the water in a "shut-off" may be discharged at the street surface. Where this is done, when it becomes necessary to drain the whole "shut-off," the adjoining "shut-off" below must be made, and the water drained off through that.

This is the method used in St. Louis for 15-inch and smaller pipes, and sometimes for large mains. Fire-plugs make the most convenient blow-offs at the streets have a good fall, and where the pipes form such a network that large and the variety and the arrange of the surety is not as the street and a stage of the streets have a

and in a city like this where most of the streets have a good fall, and where the pipes form such a network that large areas of the system could, if necessary, be emptied at one point, if a little care be taken in locating connections, valves and fire-plugs, blow-off valves may, except at a few points, be dispensed with.

Even with a blow-off at every low point in our shut-off, however, all will not be satisfactory if we have to "cut out" the pipe between a blow-off and a leaky stop-valve. The eccentricity and perversity of stop-valves are qualities much questioned by the experienced. A valve will one day leak a stream that defies hand-pumps, and the next week, perhaps, shut bottle-tight. One must be cautious,

too, about forcing them, as a broken valve might be dis-astrous. To have absolute safety from water at the point of connection or repairs, we must have a blow-off on each side of said point. Perhaps the happiest arrangement for side of said point. Perhaps the happiest arrangement for the draining of a large and important main would be to have the main valves set at low points with a blow-off on each side of each valve.

As to size of each valves.

As to size of blow-off valves, in this city 12-inch valves are generally used for 30 and 36 inch mains and 6-inch valves for 20, 15, and 12 inch mains for the sake of uniformity in castings.

What annoyance may arise from want of proper draining

What annoyance may arise from want of proper draining facilities, the following case will show:

There is a low point on the 30-inch pipe-line on Cass Avenue, west of Broadway, in St. Louis, which is not provided with any blow off, so that about ten blocks of the pipe cannot be drained. Last December an old patch on a transverse crack in this pipe gave way. There was about four feet head of water on the crack, and no way to drain ti off without cutting out. It took about 48 hours' work to make a split sleeve tight over the crack, which, could the water have been drawn off, should have been done inside of five hours. In fact, had the job been duly appreciated, a blow-off valve would have been cut in at the start. Such a delay as this omission caused would be very alarming with a very important shut-off.

Opening a blow-off valve is not all that is necessary for a quick emptying of a "shut-off." Air must be admitted at some point and displace the water to be discharged.

This brings us to the principal subject of this paper, air-

cocks or air-tans

The air-cock must serve a double duty. It must give vent to air when required, and admit air when the main is to be drained. We will first consider the air-cock as used for admission of air during draining.

Let us assume a 6-inch blow-off which would discharge under an average head of 80 feet were air admitted freely.

Assume a 2-inch air-cock at the highest point in the main. If ten feet of our head be used to force air through the If ten feet of our head be used to force air through the cock, sufficient air would enter to displace about 13 cubic feet of water per second. The remaining 70 feet of head would discharge about 13 cubic feet of water per second through the blow-off. If our main be 20 inches in diameter it will drain at the rate of about six feet per second, or a mile of pipe would be drained in less than a quarter of an hour. This is a very rough approximation, of course, as it would be difficult to even approximate closely without very complete data complete data.

To get a concrete idea of the rate of inflow of air, assume the air in the pipe to be at two-thirds atmospheric pressure. Using the formula given by Rankine for flow of air through an orifice, and the constants taken from Weisbach, we get the approximate quantity of water which would be displaced for different size air-cocks:

1/2-inch cock 1/2 cubic foot per second.
1-inch cock 3 cubic feet per second.
2-inch cock 1/3 cubic feet per second.

From this we may see at a glance that whenever one n easily spare ten feet of head to furnish air, a 2-inch cock is large enough for a 6-inch blow-off, and other sizes may be roughly tested in the same way.

In considering the inflow of air, we must remember that he water is displaced by rarified air, so that as we decrease the pressure in our draining-pipe we not only increase the weight of air flowing in per second through a given opening, but we also increase the volume of water which a pound of air will displace.

This relation of volumes should be clearly pictured in

This relation of volumes should be clearly pictured in the mind before pursuing the subject further, as it is of striking importance in the problems before us.

We shall see a little further on that as a larger air-cock is required for the necessities of filling than for those of draining, we must let the former determine its size.

When there are two or more low points in a shut-off, and hence more than one blow-off, one of them, the highest will sometimes act as an air-inlet if there he no airest, will sometimes act as an air-inlet, if there be no air-cock. In one case under the writer's notice, a 12 inch blow-off was observed to be drawing air for about an hour on account of insufficient air-openings, whereas had there been an air-inlet of the proper size at the summit, the blow-off would have been doing its proper duty, and the main would have been drained in much less time.

main would have been drained in much less time.

We have now successfully emptied our pipe, broken out and made the connection, and are ready to fill. In filling lies the danger of accident as well as delay.

When a water-faucet which has been unused for some hours is opened, a quite startling fizz-bang often follows. The phenomenon may be explained thus: By opening the cock slowly a small opening is made, large enough to let the compressed air, which has collected in the upper part of the pipe, escape at a great velocity. The water of course follows it up with nearly equal velocity to the opening, only to find the hole too small for escape. The velocity of the water is instantly checked, causing a shock or "ram."

A simple formula for water-ram in pipes has not yet

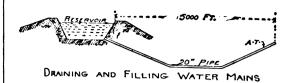

A simple formula for water-ram in pipes has not yet been published in English engineering literature. Many experiments have been made and published, but they appear to know no law. The factors of the problem seem too numerous and too hard to obtain, or what is worse,

difficult to eliminate.

One occasionally hears water-works men speak of "doubling the pressure to allow for ram."* Evidently they are considering the ram as a sudden load. A glance at the problem shows that the static pressure is a very small factor in the value of the hydraulic ram.

Mr. Fanning makes an assumption as to thetime during which the energy is expended, in estimating the ram Such an assumption, of coarse, readers the results value less except for comparison.

In order to have some conception of the force of a water-ram we will look over the following case.

Let us assume the above, supposing there to be about 100 cubic feet of compressed air in the end of our 20-inch 100 cubic feet of compressed air in the end of our 20-inch pipe, at a static pressure of 53 pounds per square inch. Now open the 2-inch air-cock "A T." The pressure of the confined air will fall about 8 pounds, due to the friction of the moving water, and we will have the air flowing from the 2-inch orifice at a pressure of 45 pounds. About 8 cubic feet per second will be discharged, as shown by our formula,* and the velocity of water in our main will hence be about 4 feet per second. Now our main will hold about be about 4 feet per second. Now our main will hold about 10,000 cubic feet of water, or about 650,000 pounds. We have then a moving energy of 325 tons at a velocity of 4 feet per second, which is equal to the energy of 81 tons, after falling I foot. Let us suppose that while things are in this condition the air-cock is suddenly closed. We will assume that only 30 cubic feet of air remain in the pipe at this instant, and that our pipe is rigid and inelastic, and therefore the whole energy of the moving body must be transferred to this compressed air, which acts as a cushion. Assuming that the product of the pressure and volume is Assuming that the product of the pressure and volume is constant, and solving graphically by an imaginary indicator diagram, we find that when 81 foot-tons of work have been done by the kinetic energy of the water in compressing the air, the final pressure will be about 200 pounds square inch, and the volume will be reduced to about cubic feet.

Let us suppose that instead of the air-cock being suddenly shut that the cock were at such a distance from and below the end of the pipe that when the rising water reaches and covers the orifice, about 30 cubic feet of air remain in the end of the main.

We would have nearly the same result as before, the only difference being the relief afforded by the 2-inch orifice for the escape of water. Had less air been left in the pipe the final pressure would be greater. This latter case must often occur in filling mains. The water is admitted too rapidly, so that the air in the main is under high pressure. the air-cock is large enough to allow air to escape in large quantities per second, but is too small to give relief to the water when the air has escaped, and often there is no air-

cushion left to ease the blow.‡

Air-cocks are usually put in at high points in the mains Air-cocks are usually put in at high points in the mains so that air accumulating in service may be released to prevent obstruction of water-way. Their use while filling the main is but incidental, and probably is not usually considered in designing the work. It may be thought by many that the cost of preparing a main for draining and filling, which are done only at long intervals, is too great for the advantages gained by such preparation; they may prefer to take the risks of damage and save the outlay. It is just as well, however, to know the factors of the problem before a decision is made. a decision is made.

The case of outflow of air from a filling-pipe is in contrast with that of the inflow in this: As we increase the pressure of the confined air we increase the promotes of air discharged per second, but we also decrease the volume which a pound of confined air will occupy in our pipe. Hence, with a given size air-cock the rate of inflow of water will be nearly the same when the confined air is at a pressure of five atmospheres as at two.

air is at a pressure of five atmospheres as at two.

If we assume the absolute pressure of the confined air which is being displaced in filling to be two atmospheres, and that said air is escaping from a 3-inch orifice, we find by our formula* that about 24 cubic feet of the confined air will be displaced by the inflowing water in one second. This would give a velocity of about 3½ feet per second in a 36-inch main or fill at the rate of a mile of pipe in about 25 minutes. We see, then, that a 3-inch tap would be large enough to fill the pipe within a reasonable time. A dangerously heavy ram would probably follow, however, when all the air had escaped.

A smaller tap would be no better unless it be so small that the velocity of the inflowing water is very low. This

that the velocity of the inflowing water is very low. This would increase the delay and loss of service, and a small air-cock has the disadvantage of giving no relief to the ram. Delay at this point is annoying, as filling the pipe

† NOTE .- The pressure due the height of water in the reservoir added to the atmospheric pressure acting through the twenty-two cubic feet will perform additional work so that the total work done in compressing the air will be over 180 foot-tons.

$$\frac{144\left(\frac{45+53}{2}+15\right)}{2,000} X_{22} = \text{for.}$$

Large air-cushions for this purpose are not altogether desirable for two reasons; First, they are too apt to increase the damage d in case of a leak or break by their explosive action; second, they bring more uncertainty into our calculations.

There seems to be a discrepancy in this estimate as compared with a subsequent report to be quoted from hereafter, showing a much greater quantity of mud removed from Piccadilly, and a much greater saving than is shown by the estimate here made for Knightsbridge, but it is given as reported.

[†] A paper by S. Bent Russell, Member Engineers' Club of St. Louis, read April 6, 1887.

[#] In a recent case of the writer's, after all stop-valves were shut, the 12-inch blow-off valve could not be opened and the adjoining "shut-off" had to be made. The whole "shut-off" necessary was thus about 10,000 feet of 36-inch pipe.

^{*} See Proc. 6th An. Meeting Am. W. W. Ass'n, p. 101.

most often comes at night, perhaps long after dark, and it is not safe to dismiss the workmen until the full pressure

is not safe to dismiss the workmen until the full pressure is on to test the new work.

A better way would be to make the air-cock larger, large enough to relieve the ram or to keep it within safe limits, and regulate the velocity of inflow at the filling-valve. An absolutely safe size for an air-cock could be found as fol-

Let Q — greatest quantity of water which could be obtained in one minute at the air-cock were air-cock as large as the main and all valves to be used in filling full open

P - maximum pressure which the pipe will safely stand.

in quantity of water which the air-cock will dis-arge in one minute with a head equal to P.

If q is made equal to or greater than Q, no damage can

In small mains and in districts where the available supply of water is not great, this safe method may be used to great advantage, even with all available valves full open for filling. The pipe is then filled in the least possible

Assuming P equal to 100 pounds per square inch and let-ting d equal diameter of air-cock in inches, the following table gives the value of q in gallons per minute for different size air-cocks:

ď	q	ď	q	ď	q
1 11/4 11/2	245 385 550	2 2½	980 1,530	3-inch fire-plug* 4-inch fire-plug*	2,030 3,600 ±

*Fire-plugs having one 3-inch nozzle or one 4-inch nozzle respect-

To show how this works out, the proper size of air-cocks for several summits in the St. Louis pipe system has been determined in this way and is shown in the table below. The available quantity of water Q was deduced from actual observations of jets from fire-plug nozzles,* and all valves were full open.

Location (Diameter of pipe in inches.	Q	Proper size of air-cock in inches.	q	
Lindell Prairie Cherokee Nat. Br. Rd. Twentieth Twentieth Sullivan Taylor Easton Finny. *The method of obtaining Q is hardly reliable for these large

The method of obtaining Q is hardly reliable for these large pipes.

N. B.—As this method referred to of determining available quantity of water at a point in a system of pipes is more reliable for determining the minimum quantity than the maximum, it should be used with caution in this case.

The observation for Page and Prairie was made on the 6-inch pipes at that point intended to be used in filling the 20-inch main which has since been laid on Page Avenue.

When the proper size air-cock becomes inconveniently large, two or more may be used. It is not necessary that all of these be at the summit of the pipe, provided that all are kept open until all the air has escaped that will. A fire-plug 500 feet from the summit is often used to help discharge the air and relieve the ram. In this city endeavor is made to so arrange the location of valves and fire-plugs that the latter may be used as air-cocks in filling. The fire-plug properly located is the safest, most convenient and economical air cock.

As large air cocks might be inconvenient for letting out small accumulations of air at summits during service, it would seem better to have at least two cocks at each summit in which air might accumulate, one being large for relief in filling, the other so small as to prevent a high velocity in the main to let out air accumulated in service. The latter would not be needed in every shut-off, as where the pipe system is a complete network the air accumulates

in service only at the summits of the system.

In this city it is often necessary to make the shut-off above the one to be operated upon in order to reach suit-

ably located air inlets and outlets.

In one case last year (1886) a 20-inch main was shut off and drained to make an air-inlet from a 36 6-inch shut-off, and when the work was completed the 20-inch was shut off again, to be used as an air-outlet when filling.

When we have reached the limit of size and number of air-cocks for relief, it becomes necessary to reduce our quantity Q so as to maintain the safe relation. This part of the science is usually left to the mechanics who work the valves. Too much dependence should not be placed on their judgment. If practicable, the main should be so

* See "A System of Pipes for Furnishing Water to Fire-Engines," Journal, Vol. V., No. 8.

connected that it can be filled but one way. If not, it

connected that it can be filled but one way. It not, it might be well to set apart certain valves to be used in filling a certain shut-off, and have it well understood that no others are to be opened until all air has blown off.

Large mains without side connections are usually filled through a "by-pass." The by-pass should be of such size as to fill the main at a proper velocity.* Where a main has small side connections, the neighboring pipes are generally used as a by-pass. This is saving in outlay, but has some disadvantages, such as filling the main from an undesirable point, filling too fast, and taking the pressure off the neighboring pipes.

wre off the neighboring pipes.

Water should always be admitted at the lowest point in the shut-off if possible, especially in small mains. Water admitted at top seems to interfere with the escape of air

admitted at top seems to interfere with the escape of air and cause disturbance in the pipe. It often also cuts off the air-cock and confines the air until pressure accumulates, thus losing time in filling.

The location of the main valves is a factor in the convenience of filling. The most satisfactory arrangement of a pipe-line for filling would be with a stop-valve on each summit, having a large air-cock on each side of it, and a stop-valve at each depression, with a small by-pass around stop-valve at each depression, with a small by-pass around it. Such completeness, however, would seldom harmonize with other requirements.

It often happens that a main must be filled from the highest point, thus almost necessarily interfering with the escape of air. About the only rule for this case is to avoid it, if possible.

If a by-pass is to be used for this, however, something might be done by purposely making the by-pass so small that filling may take place without disturbance.

When a shut-off is high in the middle and low at each end, it should be filled from both ends simultaneously.

Sufficient air vent for the increased rate of filling should

If such a shut-off can be filled from end only, and the air-vent cannot be exactly at the summit, it should certainly be beyond the summit; that is to say, the air-vent should not be between the inlet-valve and the summit, as it would be cut off by the rising water and the discharge of air greatly delayed.

To sum up, every well-appointed shut-off should be arranged with regard to throughness and quickness of draining, safety and quickness of filling.

In conclusion, the provisions for the convenient drain-

ing and filling of mains may appear simple enough, as stated in this paper, but when surrounded by the varied conditions of a city pipe system, they serve to sufficiently complicate the problem.

If the requirements of draining and filling are properly

kept in view in planning and extending a distribution system, greater safety will be assured and the cost of future maintenance appreciably reduced.

ELECTRIC-LIGHTING BY THE TOWER SYSTEM.

THIS question involves the following points:

First.-A form of construction of towers that will require minimum horizontal space for base, be inaccessible to boys climbing, and offer least obstruction to view along the street.

Second .- Strength to resist high winds.

Third.—Ready means of ascending to the lights, so that an attendant may care for the lamps without breaking the circuit.

Fourth.-Perfect accessibility of all parts for frequent inspection and painting.

Fifth.—The proper height for towers in order to yield the best practicable results-i. e., to enable the light to reach its effective limit without unduly robbing its immediate surroundings.

The system of electric-lighting from towers is of very recent date. Their construction has been subject to gradual change and development.

At the outset a square pyramidal to ver was most used, made with inclined posts at the corners, united by horital struts and braced both in the plane of the sides and horizontally. These horizontal braces prevented the ready arrangement and operation of an interior elevator, so resort was had to a triangular tower similarly braced on its exterior faces, but requiring no interior bracing. This left free space for an elevator, but, in order to insure strength, the tower was tapered from the top to the base, so that with an altitude of say 150 feet the spread at the base was about 28 feet.

This formed no great objection where the tower could be located in a park or unoccupied public square, but to light a city or town these towers had to be located at street corners. It was found necessary, therefore, to have the tower span the street or a sidewalk, so that one corner of the tower might rest near the corner of the street, and the two other corners of the tower rest adjacent to the buildings. This was unsightly and inconvenient, as frequently in cities the space between the sidewalk and the building is occupied by vaults or openings, and tower foundations placed there would often be very much in the way, necessitating the shifting of a tower location from a point where it ought to be to some other locality where it is possible to erect it.

Again, with a pyramidal tower not guyed, the windpressure caused great strains and required heavy members, and necessitated frequent adjustments and repairs. Assuming the same wind pressure per foot of height on the pyramidal tower as is permissible for the prismatic one, and that the former is not guyed and that the latter is perfectly guyed, then for equal dimensions the unguyed tower would be strained at least four times as much as the other for the same wind-pressure.

The development and improvement of pyramidal and other forms of tower gradually led to that here illustrated.

It is essentially a triangular prism, six feet on a side. built in 17 vertical sections, each 81/2 feet long, supported on a single base column and guyed at two points. The centre lengths of all sections are equal, and members, to a considerable degree, interchangeable.

The foundation is generally located just inside the angle of the curb at the street corner, and consists of a double platform of two-inch oak plank laid crosswise carrying a pier, three feet square, of hard burned brick set in a mortar of hydraulic cement and coarse sand; the pier is capped by a stone 3'x3'x6" that receives the base casting, the latter secured by six 11/8 anchor bolts through the masonry and bearing on an iron ring underneath the platform. A tubular column 14 feet high screws into the base casting and receives struts at the top connecting it with the prismatic tower. A light elevator platform runs in the interior of the tower and is carried by a single endless cable passing over a fixed upper sheave and a lower sheave attached to an adjustment lever, pivoted at the short end and counterweighted on the free long end; the outer part of the cable carries a counterpoise nearly balancing loaded elevator. Two stationary guide-cables pass through the car and are engaged by a clutch which holds the elevator stationary and only permits ascent or descent when released by pressure of the occupant's foot.

The towers have suitable lower and upper platforms with railings, and mast and arms for the lamps. All the compression members are of best lap-welded tubing, screwed into connection blocks of first quality malleable iron, that have ribs to which are bolted the forked ends screwed to each end of all the wrought-iron diagonal rods.

There are two sets of four guys each: one leading from a point 17 feet below the upper platform and the other from a point about 34 feet lower down on the tower. The guys are each a 17-inch galvanized wire cable, connected by a turnbuckle to an eye-bolt in an oak post 14 inches square by 15 feet long that is set vertically six feet in the ground at about 150 feet from base of tower and receives two guy robes in the same vertical plane. The iron-work is painted one coat of asphaltum, and the posts two coats

The towers are erected by first putting together the top section, then hoisting up and building on the next beneath it, and so on until completed. The weight of a complete tower, elevator, etc., including guy ropes, is about 7,200 pounds.

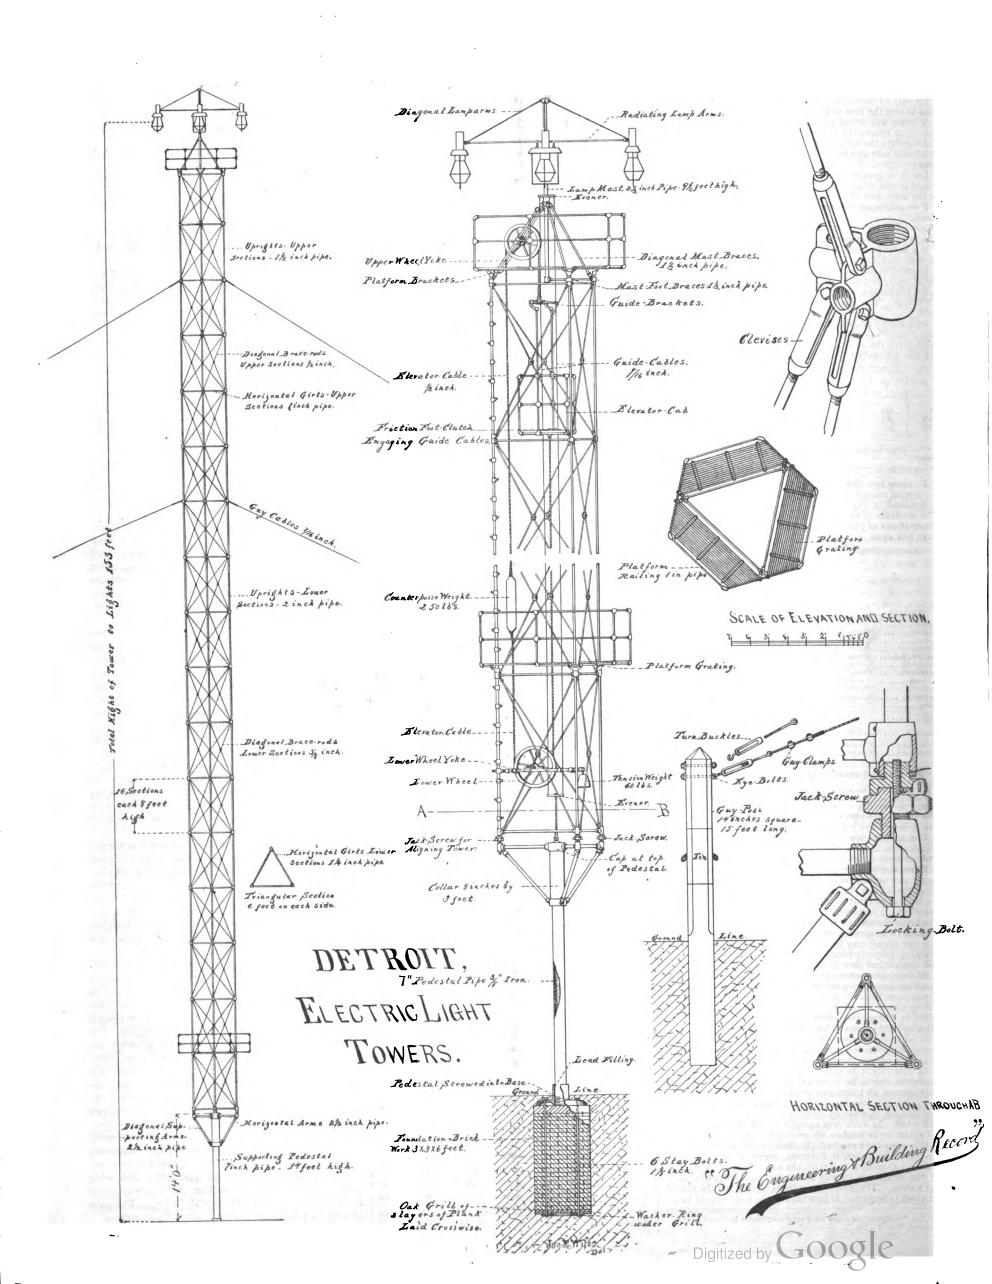

The entire wind surface, including lamps, hoods, and mechanism, is calculated at eighty-three square feet, but this should probably be increased fifty per cent. for oblique and indirect exposure.

This form of tower has been subjected to terrific storms. At Evansville, Ind., twelve of them were subjected to three cyclones, one of which destroyed large numbers of houses, barns, and shops, and, in fact, demolished some of the heavy business blocks in the vicinity of the towers. The towers were not injured in the slightest degree. The other storms were likewise very destructive of other surrounding property. They have withstood very severe storms at Detroit, Mich., where 122 of them have been in service for four years. None of them have ever sustained the slightest injury, nor have they required any repairs; not even a bolt or nut has required tightening or adjusting since the towers were erected.

In the matter of the proper height, exhaustive experiments show 150 feet to be most satisfactory. Increasing this height impairs the illumination near the foot, and does not perceptibly increase the total lighted area, while diminishing this height diminishes the illuminated area and affords unnecessary brilliancy at the base. By reason of very lofty buildings in the immediate surroundings, a height of 175 feet might be in some instances desirable.

Digitized by GOGIC

^{*} A 12-inch by-pass under 75 pounds head would discharge about 265 gallons per second, or fill a 36-inch pipe at the rate of five feet per second.

The towers should, so tar as practicable, be arranged in a triangular system. The distance apart in business sections may be 1,200 to 1,500 feet; in the best residence sections, such, for instance, as may be found in Detroit at a distance of half to three quarters of a mile from the business centre, the towers may be 2,000 feet apart, and in the less densely populated sections and suburbs, they may be 2,500 to 3,000 feet apart. Thus at Detroit, Mich., twenty-one miles of territory, having about 4,000 street intersections, is thoroughly and brilliantly lighted by 122 towers, and there are no gas nor naphtha lights within the corporation limits.

In a general way, towns of three to six thousand inhabitants, occupying, say, a square mile of space, may be thoroughly lighted in every quarter by seven towers, one at the centre and six at the angles of a hexagon, the towers being 2,000 feet apart.

So, also, an excellent illumination may be had by five towers, there being one at the centre and four at the angles of a square, the towers being 2,000 feet from the middle tower, and where greater economy is desirable there might be four towers, one at the centre and one a each of the angles of a triangle and about 2,000 feet from the centre tower.

In all cases it is recommended that the towers should have but four lights of 2,000 candle-power each. The central tower might have six lights of 2,000 candle-power. More lights will not materially improve the effect at a distance from the tower, while a less number of lights will scarcely afford illumination sufficient in the vicinity of the tower.

All spaces are lighted by the tower system—front yards, back yards, alleys, and streets; and in street-lighting alone the four lights on a tower will do the service which would require sixteen to twenty lights on poles, while the pole-lights will illuminate only the streets and not the yards and alleys.

A number of towers serve to produce an atmosphere of light so blended in every direction as to neutralize the shadows, so that dense shadows exist in no quarter, giving the effect of moonlight over the entire area.

The Detroit Electric-Tower Company was the pioneer in this work, and has profited in the construction of this tower by a very expensive experience. It has erected a large number of pyramidal towers in eighteen or more cities throughout North America, but since it produced this new type of tower here illustrated, based upon its large experience, it has urged them to the exclusion of all other styles, and has already erected them in Detroit, Mich., Evansville, Ind., Fond du Lac, Wis., La Crosse, Wis., Lima, O., New Orleans, La., Indianapolis, Ind., Owensboro, Ky., Council Bluffs, Iowa, and elsewhere.

It is stated that these towers, with 11,000 candle-power lamps, give an illumination at 200 feet and 1,500 feet equal to that from a gas-light at 7½ feet and 57 feet respectively, assuming the latter at the rather low value of sixteen candle-power. As these results are proportionate to the inverse squares of the distances, they are probably nearly correct, except as influenced by special local conditions.

Detroit, Mich., is lighted from 122 150-foot towers, costing, at list price, \$920 each, about \$112,000; allowing five per cent. interest and two per cent. for painting, etc., this gives \$7,840 cost of yearly maintenance. In 1886 the Electric Light Company's bid for furnishing lights was \$87,300, making total of \$97,140. The gas companies made a competitive bid of \$40,000 for the entire lighting, which was rejected.

For the drawing from which our illustration is made and the data for the above article, and for courtesies extended to our representative while investigating the subject in Detroit, we are indebted to Edward W. Pendleton, Esq., Secretary Detroit Electric-Tower Company.

CAR-HEATING FROM LOCOMOTIVE?

A MR. TURNER, of Fergus Falls, Minnesota, is said to have perfected a machine by which passenger-coaches can be heated without the use of fire, steam, or electricity, and which will not cause a fire in case of a railway accident.

We can think of nothing else except lime, or friction, or a pair of dumb-bells for each passenger, unless it be the hotwater "tomato-can" of our English friends. However, a Senator has been interested in the matter and we are promised a patent and publicity, and meantime will restrain our curiosity as best we can.

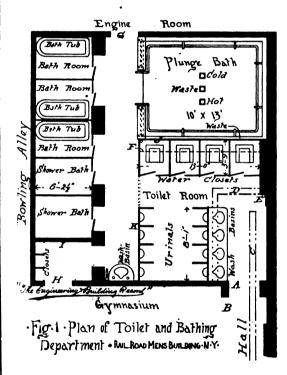

DESCRIPTION OF PLUMBING IN THE NEW RAILROAD MEN'S BUILDING IN NEW YORK.

This building is located on the north-east corner of Madison Avenue and Forty-fifth Street in New York City, adjacent to the Grand Central Depot, and was built by Mr. Cornelius Vanderbilt for the use of employees connected with all the railroads entering this depot.

The exterior is constructed of brick, red sandstone, and terra-cotta. The entrance to this building is from Madison Avenue, and the bath and toilet room is reached by a descent of twenty-one marble steps from main floor to the basement. These steps are four feet in length, and are set between two walls faced with white-glazed brick.

A ground plan is illustrated in Fig. 1 of the bath and toilet room only, which is on the side facing the railroad yard. The gymnasium is on Forty-fifth Street, and the bowling-alley is located parallel and facing Madison Avenue.

The dimensions of the bath and toilet room are 25x26 feet, with a ceiling II feet 6 inches in height. The walls of this room are faced with white-glazed brick. ceiling with white glazed tile, and surface of floor laid with unglazed tile of same color. The room receives light from three windows set near the ceiling that are facing railroad yard; but at night either gas or electricity can be used.

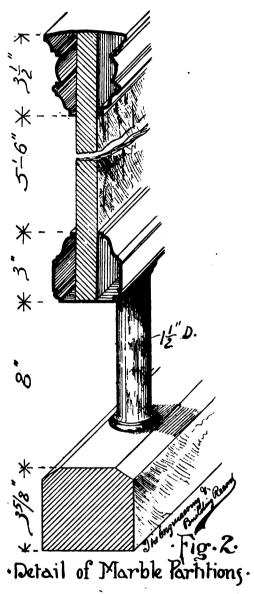

The only wood-work in this room is used for the following purposes—viz.: maple for water-closet seats; ash for doors, door and window casings and for towel-closet near door II; and cherry for window-frames.

The main entrance to gymnasium is through hall door B, but it is accessible from bath and toilet room through door II. The entrance to engine-room is through door G, and in this room is located the boiler for heating and supply of power for the pumps. There is also located here a large vertical boiler or heater containing 100 gallons, which supplies hot water for the wash-basins and for all bathing purposes required. The engineer can heat the water in this boiler by using either live or exhaust steam during cold weather; but in warm weather, when the heating boilers are not in use, a special heating device, attached to it, is utilized.

The bath and toilet room is divided into small compartments for the purposes required, as shown in Fig. 1, but the top of partitions separating these compartments does not exceed 7 feet in height above the floor, excepting one opposite H at I, which is 9 feet 3 inches in height, and consists of a brick wall 5 feet 10 inches in height above floor, on which rests a marble slab, with molding on top. shown in Fig. 2. All other partitions between compart-

ments consist of marble, light in color and one inch in thickness, and are generally made of two slabs; the principal exception being in the partition between water-closets and plunge bath at J, which consists of four slabs, each seven feet in height, and are solid from floor to tank F.

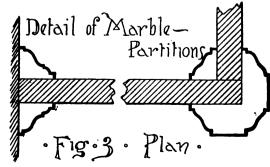

Figures 2 and 3 illustrate details of the mollings that are applied to all partitions between compartments wherever the edges are exposed, excepting the narrow slabs between the urinals, partition J, and brick wall I. These moldings are made of bronze, and a detail of section applied to top and bottom of partitions is shown in Fig. 2. The lower molding rests on bronze standards made of tubing, which are supported by a marble base 3½ inches in height. A horizontal section is given in Fig. 3, showing the molding which abuts against the wall, and a detail of vertical edge of marble partition, connected with a marble slab set between urinals at the back of wash basins

The marble partitions between water-closets are trimmed in the same manner except the rear vertical edge where the molding has been omitted. A space of eight inches between lower moldings and marble base in the partitions permits free circulation of air near the floor between each compartment at all times.

permits iree circulation of air near the floor between each compartment at all times.

A tank 13'x16' and 21 inches in height is shown in Fig. 1 at F, constructed of six marble slabs set over the water-closets, resting on the partitions. In this tank a flushing-cistern is set for each water-closet.

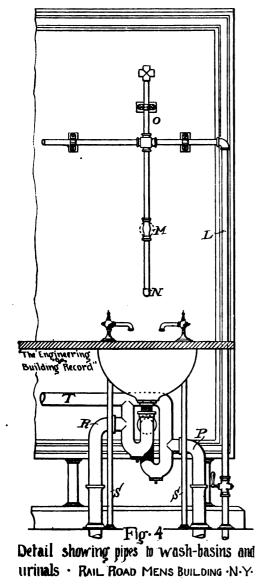

The plunge-bath is 10x13 feet and six feet in depth, the walls and bottom faced with white-glazed brick. A brass nickel-plated tube, 1½ inches in diameter, extends around the bath near the top and shaped into a ladder at one side to facilitate exit from bath.

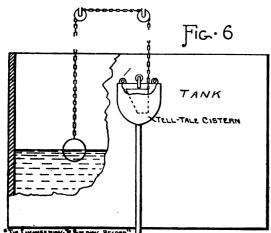

There are three compartments, each containing an allporcelain bath, and in two compartments shower-baths are provided, with fixtures to combine hot and cold water. There are four water-closets, eight urinals, and five washbasins shown in Fig. 1.

The main supply-pipe is galvanized iron and two inches in diameter, entering the engine-room from railroad yard, with a branch from it of same material, 1½ inches in diameter, to supply the compartments in bath and toilet room.

All supply and waste pipes exposed above the floor are of brass, nickel-plated. Figure 4 shows the arrangement of pipes for a wash-basin and a urinal, and each of the remaining three on this partition are arranged in the same manner. The pipe L is intended to supply water for flushing the urinals. All pipes are located on one side of this partition, as shown in Fig. 4, and therefore nothing but the urinals are on the opposite side, except a self-closing

cock over each urinal at M. The extension of supply-pipe above L at O is intended for the air-chamber to prevent hammering when stop-cock is closed quickly. At R is shown the waste-pipe from wash-basin, and S S the hot and cold supply-pipes for it, each supply-pipe passing vertically from the floor to the basin in front of waste-pipes.

At T is represented a vent-pipe two inches in diameter that connects with traps in waste-pipes from both urinals and wash-basins, and then enters a special flue in the wall, connecting with a larger pipe which extends to the roof. The pipes on partition at K are arranged in the same manner for the urinals, with a vent-pipe entering the flue described.

The water-closet seats are supported on solid brass nickel-plated standards resting on the floor and are ornamental in design; and the 2-inch back-air pipe for closet bowls is also supported on solid standards of the same material. This vent-pipe is carried to the outer wall, then passes over the front of the partition and enters a flue in the outer wall at a point above E; and in this flue a 4-inch pipe is carried up this wall to the roof, thence under corrugated tile of roof to apex, where it extends above it. The water-closets of the wash-out type are flushed by a seat attachment connected with the cistern, which is enclosed in marble.

The dotted lines at D, Fig. 1, show the line of wall for the brick vault, which extends from the point shown to sidewalk, where there is an entrance to it through a horizontal iron door in the walk, and in it are located soil-pipes and sink. This vault is five feet wide and four feet high. The construction of floor for toilet and bath room is shown in Fig. 5. The supply-pipes not exposed are galvanized iron, and are imbedded in the 6-inch layer of concrete. The supply-pipe from main in engine-room is 1% inches,

bottom of plunge-bath, a lower waste is provided for removal of water in plunge-bath below waste Y, shown in Fig. 1 at centre of bath, extending under bath from this point to a cesspool in engine-room.

The floor of engine-room is about six feet below bath and toilet room, therefore on a level with bottom of plunge-bath. This cesspool is eighteen inches in diameter and three feet deep, and therefore, to remove the water from it, a syphon is formed with a pipe one inch in diameter that connects at apex with a 3-inch blow off pipe from boilers, and is two feet below floor of bath and toilet rooms at point of connection; thence running to a low point in the 6-inch soil-pipe, connecting with it near the outer wall on Forty-fifth Street. As this syphon changes at its highest point from I inch to a pipe 3 inches in diameter, a loss of head will occur and therefore sometimes fail to work, and to overcome this a special device has been fixed in the cesspool to utilize either pressure from water-supply or steam for that purpose, utilizing the former to charge the pipe.

The janitor's quarters are located on the third floorand are provided with a kitchen in which is located a range, boiler, sink, and wash-tray; also a bath-room in which is located a porcelain bath-tub, water-closet, and two wash-basins, each being provided with the same elaborate style of fixtures previously described. The water-supply from janitor's room is obtained from a tank near the roof, 4x6 feet and 4 feet high, holding 490 gallons of water.

with branches to tub and shower baths, each being one inch in diameter; and the branches to flushing-cisterns, row of wash-basins, and each row of urinals are one inch also. The plunge bath is supplied direct from main in engineroom, connection being shown near centre of bath in Fig. 1; and the diameter of these supply-pipes is two inches.

A 3-inch waste-pipe branches from soil-pipe C and runs to compartments containing wash-basins and urinals, with 2-inch branches from it of lead, which connect with the brass waste-pipes previously described, below the layer of broken stone.

The branch soil-pipe X from the water-closets enters 6-inch drain-pipe, as shown in Fig. 5.

The floor of each compartment containing tub and shower baths have separate waste-pipes of lead, two inches in diameter, leading from them to vault, and there discharge into a sink, as shown in Fig. 5.

The ground under the main building is sub-drained with tile three inches in diameter, laid below the course of broken stone, with spaces of six feet between each line of pipe, and they discharge into vault. This vault has a separate connection with sewer, which is trapped. The side walls are built of brick, and bottom of concrete.

The overflow and waste pipe from plunge-bath is shown at Y, and in it is set a valve E, with handle extending up through floor at E, shown in Figs. 1 and 5. This 3-inch waste changes to a 4-inch before connecting with trap under sink, and in this 4-inch pipe a bick-water valve is set, which is shown at V, preventing any water flowing from sink to plunge-bath when the valve E is open and bath empty. The top of waste-pipe Y is about on a level with drain-pipe, but shown in drawing above to represent detail clearly. As this waste is about six inches higher than

This tank is provided with a special device, shown in Fig. 6, to warn the engineer not only when the tank is filled, but also when it requires refilling. An automatic flushing cistern is secured to one side of tank, and a 14-inch tell-tale pipe extends from it to engine-room, with a pipe from tank which will discharge into tell-tale cistern. This cistern is adjusted to dump automatically only when water in tank falls to within one foot of bottom. A chain is attached to one side of cistern and carried over tank suspended on pulleys, as shown, with a float on opposite end. This chain is drawn taut whenever water in tank falls to the point stated; then the weight of float dumps the cistern, causing a rush of water do an the tell-tale pipe. warning the engineer. When tank is refilled by pumping, the overflow fills this cistern, and runs down tell-tale pipe, notifying the engineer that tank is full.

The master plumbers were Messrs. Mead & Rossman' and the architects Messrs. R. H. Robertson and A. J. Manning, all of this city.

WHY DO STEAM-HEATING CONCERNS CON-DEMN THE ONE-PIPE SYSTEM OF STEAM-HEATING?

WORCESTER, MASS., December 19, 1887.

SIR: Why is it that so many steam-heating concerns condemn the one-pipe system of house-heating in every case, and will not acknowledge that it ever does, or can work satisfactorily, when it is well known that it works all right in many cases?

Digitized by Google

Of course, it is plain to every one that two pipes are indispensable in any large building when heated by a high-pressure steam-heating boiler.

But there are many small or medium-size dwellings,

But there are many small or medium-size dwellings, with about five to fifteen radiators, heated with some of the various low-pressure apparatus, which have but one pipe, without even drip-pipe at foot of risers, and work all right, without any noise or any trouble whatever.

The writer of this is familiar with a number of such cases, and cannot see why it should be so utterly condemned, when it is simpler, and saves some expense, without any apparent disadvantage.

without any apparent disadvantage. INCUIRER

[We are not aware that the one-pipe system of conveying steam from boilers to radiators is unqualifiedly condemned. With certain good radiators, and in the hands of careful fitters, very good results are obtained. With it in buildings that cover a good of ground, it is often at a disadvantage, however, when contrasted with the twopipe system. For instance, every coil or radiator will work with an inlet-pipe for steam, and an outlet-pipe for water, and but very few coils will work with a single pipe for both purposes. Nearly all the modern radiators will work under one pipe if it is of large diameter; still there are some that will not, and these must have a return pipe.

One decided disadvantage the one-pipe and one-valve apparatus has is its great tendency to make noise when steam is let on a radiator, and its slowness to expel water when the radiator is once full. Let a radiator with a single pipe be shut off carelessly—that is, not tightly closed—or let there be a leaky valve to it so the radiator will condense itself full of water, then upon opening the valve there will be from 10 to 30 minutes of the most frightful racket experienced—technically known as waterhammer-before the statu quo is established, and the affairs of that household go in anything like harmony again.

The system is, however, between 5 and 10 per cent. cheaper than the double-pipe system, and where it can be used we see no very great objection to it, provided the persons who are to use it are not led to believe it is the

DANGEROUS HIGH-PRESSURE HOT-WATER APPARATUS, INDICATING RATIO OF DAN-GER WITH ORDINARY EXPANSION TANKS SHOULD THEY BE CLOSED, WITHOUT A SAFETY-VALVE, OR IN SUCH A MANNER THAT THE SAFETY-VALVE CAN BECOME INOPERATIVE.

-, December 12, 1887.

SIR: I have a few questions I would like your opinion on. A gentleman persists in running his hot-water apparatus under extra pressure, the result being that he has broken his boiler twice. He admits that he is running under considerable pressure, and cannot seem to see the desirability of doing the work under the pressure of

the water only.

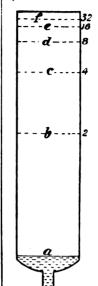

My first question is this: We will assume a low-pressure hot-water job, with the expansion tank open to the atmosphere, and that the tank is 24 feet above the heater, giving a pressure,say.of 12 pounds to the square inch. Now, suppose a safety-valve is put on this tank, and it closed to the atmosphere, and the ball on the lever of the safety-valve run out to 5 or 10 pounds, what extra pressure would there be on the apparatus, over and above the column of mater, when the valvance cet as above prestread. umn of water, when the valve was set as above mentioned?
(2) Suppose the safety-valve became corroded and stuck, what, in your judgment, would be the most pressure they what, in your judgment, would be the most pressure they could get on the job? (3) I would also thank you to give me the different pressures, supposing the tank to be set, say 20, 30, 35, 40, 50 and 80 feet above the heater, and closed to the atmosphere? Of course, I am aware what the pressure of the hydrostatic column of water is at the different heights, but what I want to get at is the increased pressure by closing the tank to the atmosphere when the tank is placed at the above-mentioned heights above the

[(1) The greatest possible additional pressure that can result where a safety-valve is in good order will be the original head of water in pounds, plus the pressure the safety-valve is set for, which, in this case, would be 12 + 10 = 22 pounds.

(2 and 3) If the safety-valve became corroded and will not lift there is no estimating the pressure for general conditions. It would be simply a 20, 40 or 80-foot head, plus the unknown quantity, which latter could readily reach disastrous dimensions, unless the closed expansion tank was much larger in capacity than ordinary practice.

We will add, that unless the water in an apparatus is to be carried above the temperature of 212° Fah, nothing can be gained by using a closed tank. The circulation will be no faster thereby, and for house-apparatus this practice should not be tolerated, as it makes an apparatus, which is otherwise absolutely safe, dangerous, and liable to burst and scald people.

To see this in its proper light, what we have to consider is to imagine an ordinary apparatus with an expansiontank one-twentieth of the whole capacity, or sufficient to take care of the increment of the expansion of water from 40° to 212° Fah. If we close this tank so the air cannot

escape, the accompanying diagram will show the additional increment of pressure, caused by the expansion of the water and the compression of the

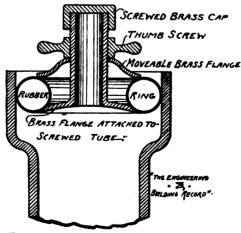

When the water is at a the water in the apparatus is cold, say with a temperature of 40° Fah. When it is warmed to about 155° it rises until it reaches the position b, or half-way up, and has compressed the air above it until it has a pressure of two atmospheres. At a temperature of about 185° it is at c, and the pressure of the air is four atmospheres; at 200°, or thereabouts, it reaches d, and the pressure is eight atmospheres, and at e, sixteen atmospheres, and at f, thirtytwo atmospheres, or 480 pounds pressure per square inch, and, as yet, the water has not reached a temperature of 212° Fah.

With a tank of twice the capacity, of course, the danger is very much lessened, as then one extra atmosphere only can be added to the pressure caused by the water-head for a range of temperature between 40° and 212°, but the danger still continues beyond 212°, and, therefore, the practice should be condemned; and where high temperature is an absolute necessity, the designing of such an apparatus should only be entrusted to one thoroughly conversant with the subject.]

PLUG FOR TESTING SOIL-PIPES.

MONTREAL SANITARY ASSOCIATION. Standard Buildings, St. James Street, MONTREAL, I'ecember 19, 1887.

SIR: With reference to the inquiry of "Subscriber" about plugs for testing drains or soil-pipes, I may state that I daily use a rubber device which I find most satisfactory. I use it for applying the "smoke test," but it was designed to withstand water-pressure. It consists of was designed to withstand water-pressure. It consists of a rubber ring placed between two brass flanges which can be squeezed together by a thumb-screw after the ring has been inserted in the pipe, so as to make the ring fit very tightly. A different size of ring is required for each size of pipe, but one pair of flanges does for several sizes of rings. The device is something like this in section.

PLUG FOR TESTING SOIL PIPES

When applying the smoke test the cap is omitted and a rubber hose is attached by means of a coupling.

These rings and flanges, etc., I bought along with a smoke-resting machine from Messrs. Burn & Baillie, plumbers and brass workers, Hanover Street, Edinburgh, Scotland, who are the makers.

I am, yours truly,

RICHARD P. FLEMING, M. Can. Soc. C. E.,

Engineer of the Montreal Sanitary Association.

A COURSE IN SANITARY ENGINEERING.

TUBBSVILLE, O., HENRY Co., December 16, 1887. SIR: Will you please give me some information on learning sanitary engineering, and as to the best place for such a course, and oblige,

ALFRED S. TUBBS.

[Columbia College, New York, has a regular four years' course, and confers the degree of sanitary engineer.]

THE "ENGLISH WAY" OF CAR-HEATING.

THE Buffalo Courier quotes a refined tourist as saying: "So Charles Dickens doesn't like the way we heat our railway cars. We really must adopt the English way. And what is that? Why, a rather large flattened tomatocan is filled with hot water and put on the floor of the carriage and you're supposed to keep warm on it. The only way to g t any warmth out of it at all is to hold it on your lap and then your back freezes. One of these hotwater cans is expected to keep you warm for twelve hours. It gets stone cold within two. and ice-cream may be kept from melting on it. If our English friends don't admire from melting on it. If our English friends don't admire our way of heating cars let them go home."

Perhaps, however, Mr. Dickens was right after all, for even a cold "tomato-can" will, in case of collision or derailment, be preferred to the warmest car-stove by all who are not partial to ante-mortem cremation.

By the time Mr. Dickens next visits us we hope that car-heating from locomotive will have made such progress as to reconcile him to the American way.

Gas and Electricity.

COMPARATIVE COST OF GAS AND ELECTRIC LIGHTING OF GRAND CENTRAL DEPOT, CINCINNATI.

MR. JOHN W. HILL, M. E., Professor Thomas French, Jr., of McMicken University, and C. E. John, electrician, were recently employed to test and report on comparative cost of lighting the Grand Central Depot at Cincinnati by gas and incandescent electric light. The electric light being charged with cost of steam to run the dynamos, the result was in favor of gas. General Hickenlooper, the President of the Gas Company, offers to enter into a contract with depot owners "for any desired number of years to light the entire premises with gas and guarantee that the degree of illumination shall in no case be less than that now afforded by electricity and charge forty per cent. less than the incandescent lighting cost last year.

TELEPHONES FOR BUENOS AYRES.

A COMPANY in Buenos Ayres has recently ordered the material for a complete system of telephones from the Société Générale de Teléphonés at Paris. Annales Industriclies states that over two thousand subscribers have been obtained, and the company proposes to erect a tower in the river, which will serve as a maritime telephone station. The harbor of Buenos Ayres is shallow, so that vessels are obliged to anchor several miles from the city. Telephone communication by means of a tower near the anchorage will be serviceable.

ELECTRIC CAR-LIGHTING IN RUSSIAN TUNNELS.

Annales Industrielles gives an account of a method fo lighting the fast trains from Kieff to Odessa, in Russia, by means of electricity. The object is to light the cars during the day while passing through tunnels. The plant consists of a powerful Crompton compound dynamo machine, which supplies a current of 110 volts electromotive force. There are three circuits of 2,000, 1,460, and 6,540 feet respectively. The rails are used for the return conductor, and the other wires are laid in a central tunnel between the tracks. Contact is made in each tunnel with the wire for that circuit by contact pulleys on the car axles. Each car has its own contact with the wire, so that all complicated connections of coupling a train are avoided. The train may stop while in the tunnel and the system will continue to operate. The company has applied the system to seventy-four cars, and they report that the expense of the system is less than one-third the cost of gas.

THE NEW ELECTRIC RAILWAY FROM BROOK-LYN TO JAMAICA.

THE Jamaica and Brooklyn Road Co., owning the old Jamaica Plank Road, have just finished and put in operation an electric railway to take the place of the former horse cars. It extends six miles from the Alabama Ave-

nue station of the Brooklyn Elevated Railroad at East New York to the town of Jamaica, and is operated on the "Van Depoele system." The electric-power station is at Woodhaven, about midway on the road. The track is single, with turnouts. The electric power is generated by a 175 horse-power compound engine, made at the Putnam Works, of Fitchburg, Mass. The plant is arranged to sup; ly light as well as tractive power at all points on the line of the road. The Van Depoele Electric Generator is a series wound dynamo of 100 horse-power and makes 500 revolutions per minute. The exciter, which regulates the power, is of about eighthorse-power and makes about 1,400 revolutions per minute.

The power is transmitted by two 3/8-inch copper wires. stretched over the centre of the track to the cars by means of "travelers," or brass wheels, with plumbago bearings, running on the wires, and attached by 3/8-inch insulated copper wires to the fifteen horse-power electric motor in a closed compartment on the front of the car. On the motor shaft is a pinion, which drives a larger gear on a steel countershaft, on each end of which is a sprocketwheel and by means of two steel chain belts motion is communicated to similar wheels keyed on the front axle of the car. On the trial trip the car, making three short stops, ran 21/2 miles in twelve minutes. The ordinary time will be twelve miles an hour, with trips every three hours at a cost for power of \$1.40 per day for each car. The entire electrical apparatus is furnished by the Van Depoele Company. The cars, which seat thirty people and are lighted by Edison incandescent lamos from the overhead power wir s, are built by the Pullman Company. Large cars or small trains will be drawn by separate motors. Aaron K. Styles has leased the road from the Road Company for the term of its charter, which is ninetynine years. William M. Scott is the Superintendent and Vice-President.

Roads are said to be successfully operated on the Van Depoele system at Binghamton, N. Y., Scranton, Pa., and in several Western cities.

THE BOSTON SOCIETY OF CIVIL ENGINEERS.

AT the regular meeting of the Boston Society of Civil Engineers, 21st inst., President L. F. Rice in the chair, a paper prepared by George A. Ellis, giving a description of the Racine Water-Works, was read by the secretary and discussed by members. Mr. M. M. Tidd gave a description of the Simpson Dry Docks, New York. Twenty-six members present.

THE ENGINEERS' CLUB OF ST. LOUIS.

THE club met December 7, President Potter in the chair, William H. Bryan, Secretary; twenty-nine members and three visitors present. Reno DeO. Johnson, Oscar W. Raeder, James C. Simpson, and Albert H. Zeller were elected to membership.

The following nominations were made for the coming year: For President, M. L. Holman; Vice-President, J. A. Ockerson; Secretary, William H. Bryan; Treasurer, C. W. Melcher; Librarian, J. B. Johnson; Directors, William B, Potter and F. E. Nipher.

President Potter read the report of the Executive Committee, which showed the club to be in a prosperous condition. P. M. Bruner then read a short paper on "The Action of Frost on Concrete Work." He explained the difficulties met with, and reported the results of a series of experiments he had made on Portland cement; also offered suggestion for counteracting the influence of low temperatures. He said the addition of salt would lower the freezing point one degree for one per cent. addition up to the point of saturation, and would also increase the tensile strength. The discussion proved very interesting, those participating being Robert Moore, J. A. Seddon, Wheeler, Professor Johnson, Ockerson, Macklind, Flad, Holdman, and Caldwell. But little reliable data was to be had. Professor Johnson offered to make a series of tests. It was shown that the best work was secured between the temperatures of 45° and 70° Fah.

THE AMERICAN SOCIETY OF CIVIL ENGINEERS.

A MEETING was held Wednesday evening, December 21, and, in the absence of the President, Mr. W. R. Hutton occupied the chair. Announcement was made that the annual meeting would be held on Wednesday, January 18, when officers would be elected and the place of the next annual convention decided upon. The secretary

stated that an invitation had been received from Milwaukee inviting the society to hold its next annual convention in that city.

On January 10 various points of interest about the city would be visited, and among them the new bridge crossing the Harlem River, to which the society was invited by the engineers in charge.

Then followed the paper of the evening on the Venturi water-meter, of which an abstract is given below.

An interesting discussion followed, which was participated in by Messrs. Flagg, Church, Emery. Streidinger, Closs. Brinckerhoff, North, and Brush, the general opinion being that the new device promised to be of great value.

THE VENTURI WATER-METER.

BY CLEMENS HERSCHEL, M. AM. SOC. C. E.*

Some additional instrument or method for gauging water has long been desired by hydraulic engineers. In the case of water flowing through pipes, as in city waterworks, it is exceedingly difficult, or impracticable, to meter the water, as soon as diameters approaching one foot or quantities approaching a million gallons daily are reached. In some such cases the stream of water has been split up into many smaller ones, each of which was then furnished with a meter, and the tail-water of these meters reunited; a method and apparatus so cumbersome and costly as to be rarely applicable. Taking the case on the other hand, and of a far less valuable commodityviz., of water under little or no pressure, about to be, or after it has been, used for power, the practical difficulties of gauging again become very great. Ordinary meters are out of the question, owing to the small value of the article per cubic foot, and to the proportionately great cost, per cubic foot of water metered, of applying a mechanical meter. Still, an approach to metering the water is found when the turbine or other water motor is converted, by previous tests or experiments, into a form of water-meter; and this method is doing excellent and extensive service for many water-power companies. In mills that use cheap wheels, and change their wheels frequently, it causes considerable work and expense to maintain the water-wheel system of measurements.

The weir is seldom permanently applicable to such cases, on account of the difficulty and expense of setting and maintaining it, and because it diminishes the head acting on the wheel. If put up stream from the wheel it must take the form of a movable weir, sliding up and down in grooves. The weir edge is then raised or lowered until the quantity passing the weir is just equal to the draft of the wheel; a delicate operation, and applicable only in the case of experiments where the engineer has full control of the wheel.

The writer refers to experiments made by Mr. James B. Francis, Past President of the Society, some thirty years ago, and also the method described in the Transactions of the Society by A. Fteley, M. Am. Soc. C. E., and then remarks: "It has long seemed to me that the use in metering water of the principle involved in the Bourdon anemometer an instrument, which has been used to measure the velocity of currents of air in mines, in France, would yield valuable results, and the present paper is intended to record the experiments made and results found with two sizes of water-meters of that description. Bourdon's anemometer is founded upon the property of a Venturi tube to exercise a sucking action through holes bored into its narrowest section. Then, by measuring the intensity of this aspiration by means of any form of vacuum gauge, and establishing the relation between such vacuum pressure and the velocity of the air through the tube, the instrument becomes an anemometer. This described property of the Venturi tube was known to Venturi, who made experiments with it in Modena about 1791. But Venturi suggests no use for it, as with him it was merely a curious phenomenon in the working of his apparatus.'

The writer details at some length the experiments made by others embodying the principle of the Bourdon anemometer, and then gives a long and interesting detailed description of his own experiments, which would require to be given in full to make it intelligible.

* Abstract of a paper read December 21, 1887, before the American Scc.ety of C.vil Engineers, on an instrument making use of a n-w method of gauging water, applicable to the cases of very large tubes, and of a small value only of the liquid to be gauged.

He states in conclusion that, "writing only a few weeks after the close of the second set of experiments, I very likely do not allude to all the capabilities of the meter. It seems to me it may, in many instances, replace the use of a weir, being more easily applied and equally accurate, and it can be used where a weir is entirely inapplicable. There is the promise of a great and varied usefulness in the Venturi meter."

The meters above mentioned were applied to pipes of a diameter of twelve inches and nine feet respectively, the diameter at the "Venturi" or narrowest portion where the vacuum gauge is attached being one-third of the diameter of the pipe in each case.

The coefficients in the different experiments differed by only a few per cent., showing the apparatus to be very satisfactorily accurate, although in the large meter the discharge sometimes exceeds 250 cubic feet per second. Mr. Herschel stated that, although he had patented the apparatus, he would be glad to give the right of use free to any one who would carefully experiment with it and inform him of the results.

THE INFLUENCE OF SUGAR UPON CEMENT.

ALTHOUGH the use of sugar to increase the strength of cement has been an immemorial custom in India, the subject has had additional light thrown upon it by experiments made by Mr. Harry De B. Parsons, M. Am. Soc. M. E., assisted by Mr. Henry Hobart Porter, Jr., E. M., and detailed in a recent paper before the American Society of Mechanical Engineers.

The first experiments were made with refuse molasses from a sugar-refinery, I per cent. being added to 35 per cent. of water by weight, for gauging the cement; the cement used being the Dyckerhoff Portland.

As compared with a mixture of neat cement the increase in strength was much less rapid, and up to three months had not obtained the same strength; the strengths being 353½ and 456½ pounds per square inch respectively. Mixture containing molasses showed, however, a tendency at that age to increase in strength more rapidly than the other.

As there were practical difficulties in the use of molasses owing to the rapid chemical changes in the mixture, additional trials were made with pure crystalline sugar. These were made with both the Dyckerhoff and the F. O. Norton Rosendale cements.

In the latter case 40 per cent. of water was used. All results are averages of three or four samples, and they are given in the following tables:

TESTS WITH DYCKERHOFF CEMENT (PORTLAND).

Time of Tests	Day.	Days.	Week	W'ks.	w¹ks.	Mo's.	Mo's.	Mo's.
Neat	701/5	160	2983/3	383	436	446	45634	485¾
With 1/4 % of	9	 	511/2		480	 .	52234	565¾
With 1/2 % of	43/6		413/3	 	411	•••••	552¾	ļ
With ½ % of sugar With I % of	2		341/2		ļ	ļ	52734	5713
sugar	2		47	 -	4031/2		5723/4	ļ
With 2 ≸ of sugar			50	ļ . .	334		537%	

TESTS WITH F. O. NORTON'S ROSENDALE CEMENT.

TIME OF TESTS.	Day.	Week.	2 Weeks.	Weeks.	Months.	Months.
Neat	001/	251/3	62 27	74 99 76	225 1/2 243 3/4 238 154 3/4	255 ½ 230½ 301½ 264 181¾

The manifest effect of the saccharine matter is to retard the setting of the cement; and the subsequent excess of strength the authors judge to be more mechanical than chemical, the sugar by this retarding effect giving time for the chemical changes to take place more perfectly.

The greatest increase of strength seems to result by the addition of ½ to ½ per cent. and the maximum excess to be about 20 per cent. This very slow initial setting will undoubtedly prevent the process from coming into use; and if it be true, as is stated, that the sugar seems still to exist in a crystalline state in the interior of the specimens, the gain of 15 to 20 per cent. is probably only apparent, and the cement would be equally strong without the sugar after the lapse of sufficient time.

TRESTLE ON GRILLAGE OVER HANOVER POND, CONN.

This trestle was built by the Berlin Bridge Co., of East Berlin, Conn., to carry a single-track line of the Meriden and Waterbury Railroad. It is of the ordinary type of plumb and batter post bents, braced both ways, noticeable only on account of the efficient way of securing good foundation in a bad bottom with cheap, common materials.

The water was still and shallow, and the bottom soft, treacherous, and of unknown depth. The ordinary mud-sill would not answer and a pile-driver could not be conveniently secured nor piles economically used. The Bridge Co.'s superintendent in charge, Mr. J. Devin, devised the expedient shown. Several car-loads of sound, hewn railroad ties were ordered, regularly arranged about fifteen inches apart on a level place, and factened by two 3x10-inch binder-planks spiked to each tie. This grating was floated to required position, and the corresponding bent, framed into a bottom sill, slid on to its centre line and heeled up vertical in the usual manner, braced to the preceding section, and so on for the next. The sill of the bent simply rested on the grating without any fastening whatever. Its weight submerged it and fixed it in the bottom, and the structure stood plumb and firm, kept straight and square under train load with scarcely perceptible settling

A CORRECTION.

THE OLD CHURCH AT BORGUND, NORWAY.

BOSTON, December 19, 1887.

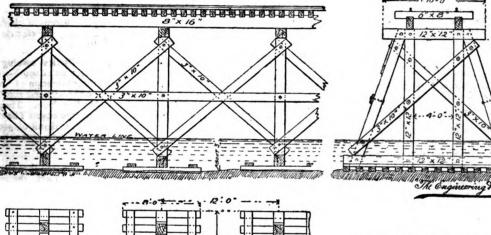

SIR: In your issue for December 17, just come to hand, the illustration is labeled Old Church at Bergen, Norway. It should be at Borgund, Norway, as you doubtless have been told a score of times before this.

Very truly, ELLEN H. RICHARDS.

THE ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.

The regular meeting of the society was held at Pittsburg December 20. President Alexander Dempster called the meeting to order, and the following gentlemen were elected to membership: Charles I. Traville, Lewis C. Weldin, H. Ward Verner, Frank Felkel, J. P. Daine, G. M. Engel, L. H. Simpson, and H. C. Campbell.

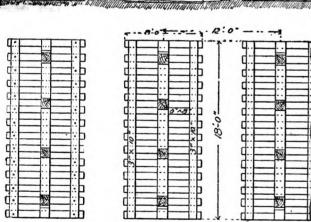

Mr. W. Lucien Scaife, as chairman of the committee, which included also Messrs. Charles Davis and Charles Ehlers, instructed to investigate into the Fort Wayne accident, and to report upon a method of avoiding such an accident in the future, then read the report of the committee, which was accepted and filed, and the Secretary was instructed to send copies of the report to Councils and the different railroads.

TRESTLE ON GRILLAGE

HANOVER POND, MERIDEN, CONN.
N. Y., N. H. & H. R. R.

NOTE.—Vertical and batter posts connected with mortise and tenon joints and 2-inch pins. All brace plank bolted on with 3/-inch bolts.

HORIZONTAL SECTION JUST BELOW WATER LINE

under the first application and none afterwards — It gives perfect satisfaction under constant traffic. One bent was put in with the binder-planks underneath the ties, but, owing to a slight current or springs in the bottom, it was quickly undermined by a channel its whole length. By turning the grating, the other side up however, the difficulty was entirely obviated.

Der Praktische Maschinen Constructeur says that Dr. Bernadon, a Russian physicist, has recently discovered a method for welding iron with other metals by means of electricity. It is claimed the difficulty hitherto has been to obtain sufficient current strength. Dr. Frank referred to this difficulty in a lecture before the Polytechnical Society of Berlin in view of the fact that lightning-rods of any considerable thickness are never fused. Sir William Thompson also failed to solve the problem satisfactorily. Dr. Bernadon, it is asserted, has succeeded by a comparatively simple method. He uses large machines of 20 to 25 horse-power to charge a storage battery, and uses the stored energy at the desired moment. He has not only welded iron upon iron, but iron with steel, copper, and bronze, and makes a practically perfect union. A company at Rixdorf, near Berlin, are building a plant to use this method.

[We believe all this was shown at the recent fair of the American Institute in New York City.—ED.]

This committee finds that the grade crossings, or the bulk of them, are serious and dangerous obstructions, and that they should be dispensed with.

They are of the opinion that the proper way to relieve the Fort Wayne Railroad crossings on the principal thoroughfares in Allegheny and in Pittsburg is by elevating the tracks of the Fort Wayne Railroad with its connection, the West Penn Railroad. The clearance height of the railroad at street crossings should at least be 13½ feet.

By such an elevated road the Fort Wayne and West Penn will be greatly benefited by the increased facilities afforded in the running of trains, the handling of freight and passengers, and in other respects in being relieved of the expense of flagmen, gatekeepers, and the liability for damages by accidents at gate-crossings. The cities will be the gainers by reason of relief from danger, and interruptions at crossings, and the enhancement of the value of property along such lines.

The length of lines to be changed is about two miles, and even if the cost should reach \$1,500,000, it would not be an unreasonable project, considering the benefits to be derived by the railroad and cities.

A discussion, the principal points of which will be given later, followed on Mr. Ramsey's paper on "The Effect of Temperature on Structural Iron and Steel." of which we gave an abstract on October 29, during which an interesting chart was shown, giving the number of rails broken

in winter as running above 100 a month and in summer being as low as three.

W. T. Scaife was then nominated to succeed M. J. Becker as Vice-President, T. P. Roberts to succeed Mr. Scaife, and Charles Davis and W. C. Phillips as directors.

AS TO PRICES OF PORTLAND CEMENT.

(From the London Times.)

THE Hamburg Borsen Zeitung, in discussing the question frequently raised of late, whether the present movement in Portland cement is transient or whether the prospect for the ensuing year is favorable, says: "Significant indications are given by the result of the public competition which took place in Posen on the 2d of this month for the large quantity of 85,000 normal tons. This cement was ordered for use on the royal fortifications, and is deliverable in the period from now to June, 1889. The tenders submitted by ten manufacturers are, on the average, after allowing for transport charges, 13 per cent. higher than those of June 2, obtained by the same department for 18,000 normal tons. Especially significant is the fact that the lowest tenders of November 2 are about 23 per cent. above the lowest of June 2."

THE Royal Institute of British Architects have instituted an admirable competition, to be held next year, with a view to encourage the study of stereotomy. The subject of the competition will be "The Vaulting of an Angle of a Cloister," to be shown by a model and working drawings. It will be an open competition, and a special class for instruction in stone-cutting will be opened under Mr. Harvey in connection therewith. The institute gives notice that the models will probably have to be constructed in the rooms of the institute and in the presence of moderators representing the council.

THE electric street-car fitted up by the Weston Electric Light Company, that has been traversing the Cambridge roads for the last six months or so, made its first appearance on Boston streets the other day. It is driven from a Julien storage battery, and surmounts the steepest grades with ease. It will soon be used for regular trips between Boston and Harvard Square.

A PROMISING coal-mine has been struck at Jordan, Scott Co., Minn.

A saw-MILL boiler exploded December 13 at Mt. Sterling, Ky., killing the sawyer and badly injuring the engineer. It weighed four tons and was thrown 125 yards, demolishing in its flight part of a machine shop and tearing up a railroad track. Cause, low water.

JOHN C. COCHRANE.

JOHN C. COCHRANE one of the best known architects in Chicago, died at his residence December 14, after an illness of but six days. Born in New Boston, N. H., November 8, 1833, after receiving an academic education he came to Chicago in 1855, and was employed for some time in an architect's office. A year later he opened an office in Davenport, Iowa, and for the next two years designed most of the principal buildings erected there. In 1864 he came to Chicago to reside permanently. He made a specialty of public buildings, and the North-west is dotted all over with monuments to his professional skill. In Chicago the structures with which his name is most prominently connected are the Chamber of Commerce, the Cook County and Michael Reese Hospitals. Rush Medical College, First Presbyterian Church, Jefferson Park Presbyterian Church. Church of the Messiah, and Central Baptist Churcn. Besides these public buildings he designed a large number of private residences in the city. He was twice married, and leaves three children.

Mr. Cochrane died of nervous prostration. He was sick but a short time, and his illness was not regarded at first as at all serious.

PERSONAL.

MR. HAROLD PETO, of the firm of London architects. Ernest George & Peto, is now visiting the United States and inspecting buildings and American methods of construction.

CHESTER B. DAVIS, of Chicago, and Colonel H. Flad, of St. Louis, have been appointed as consulting engineers to assist Special Engineer Whitman in his duties of planning for the intercepting sewers of Milwaukee.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITIONS.

MINNEAPOLIS, MINN.—The time for receiving competitive plans for the new Court-House and City Hall has been extended to February 15, and the size of the stretchers may be increased to 48x48 and 55x55.

For works for which proposals are requested see also the "Proposal Column," pages i-iv-64.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE ENGINEERING & BUILDING RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and rel able news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

WATER. SEWERAGE, ETC.

SALEM, MASS.—The water board, in its annual report, will recommend the building of a main around through Danvers in preference to building a reservoir on Gallows' Hill.

RIVERSIDE, CAL.—This place has water bonds in the sum of \$150,000 for a water company to make improvements and extend the water privilege.

NEW ROCHELLE, N. Y.—The Manhattan Life Insurance Company has made a contract with the New Rochelle Water Company to supply Rochelle Park with water.

GRAND RAPIDS, MICH.—The proposition to bond this city in the sum of \$250,000 for extending the water-works system was lost at the recent special election.

WILMINGTON, N. C.—Concerning a report that the water-works company at this place were to sink several artesian wells, our correspondent writes as follows: "No action taken, nor is any contemplated at present."

NEW YORK CITY.—At a recent meeting of the Aqueduct Board the plans of the Quaker Bridge Dam and Reservoir, presented by Chief Engineer Church, were accepted, and the Chief Engineer was directed to prepare working plans, with a view of putting the work under contract.

BEAUMONT, TEX.—It is reported that water-works are to be erected here by the Reliance Water Company.

RIVERSIDE, CAL.—This place has voted \$150,000 bonds for the water company to make improvements and extend water privileges.

THE expenditure for sewers in Minneapolis last year was \$228,072, a little over six miles of sewers having been built.

OTTAWA, ONT.—Dr. Ferguson, M. P. for Welland, and Mr. Gross, of Welland, has asked the Minister of Railways for permission, on behalf of the town of Welland, to draw a supply of water from the Welland Canal for the new water-works there, now building. A satisfactory reply is anticipated.

KINGSTON, ONT.—The water-works system will undergo a great improvement. New mains are to be laid, two new Hyatt filters are to be placed in the lake, and an iron tank, 70 feet high, to add to the pressure of the water at the reservoir, will be erected. These improvements will involve the expenditure of \$100,000 over and above the \$120,000 which the city paid the con.pany for the works.

DOVER, N. H.—The question of constructing a water works system here having been decided favorably, the City Council has directed Percy M. Blake, C. E., of Hyde Park, Mass., to prepare working plans and specifications for the proposed system, and to present the same to that body, who will proceed with the work immediately.

Grand Rapids, Mich.—It is probable that the Board of Public Works will expend about \$12,000 in making repairs to different portions of the water-works system, laying new mains, etc. It is proposed to procure a new pump for \$5,000, a new boiler for \$4,000, and use the remainder of the appropriation asked for in substituting iron mains for some of the wooden ones. The Common Council will dispose of the matter at its next meeting.

ANDERSON, CAL. — Our correspondent writes: "The Anderson Water Co. is now constructing a ditch, which will be about eight miles long. It will conduct the water into a reservoir or large cistern, to be dug later. This reservoir will be at an elevation of at least 150 feet above the town. Mains will carry the water from this reservoir to all parts of the town, to be used for household, fire, and irrigating purposes."

SIDNEY, O.—Our correspondent writes: "The question of the appropriation of \$6c,000 for the improvement of our water-works will be voted on January 3, 1888."

FAIRHAVEN, MASS.—Our correspondent writes from here as follows: "The scheme for a water works in the town of Fairhaven is only a scheme as yet, but as it is a great necessity, both as a sanitary measure and for fire service, it is hoped some capital interested in building such work will visit the town and investigate it as an investment. There is a natural supply of water nearly in the centre of the town. The mains would be short, and furnish a thickly-settled district, and the town would pay well for hydrants."

BOOTHBAY, ME.—It is reported that H. A. Hancox, of Hudson, Mass., will construct a system of water-works here.

DELAWARE, O.—The Delaware Water Company has been incorporated. Capital stock, \$1,000,000. T. M. Marriatt, B. W. Brown and others are the incorporators.

CUCAMONGA, CAL.—The Cucamonga Water Company has been incorporated. Capital stock, \$100,000. E. T. Wright, W. B. Nicholson and others are the incorporators.

PERTH AMBOY.—It is probable that steps will scon be taken here to improve the water-works system. The present supply is unwholesome, and has been declared unfit for use. It is possible that a supply will be obtained from Rahway.

NILES, ().—Dr. Miner has purchased the Holly pumps, formerly in use in the Youngstown water-works. They will be placed in the Baldwin Mill in this place, and a system of water-work, may be inaugurated for the benefit of private consumers, or perhaps the town; but, our correspondent writes, "as yet no steps in that direction have been taken."

CAMBRIDGE, MASS.—In reference to the water-works improvements at this place our correspondent writes as follows: "Cambridge pumps from Fish Pond her water-supply into a reservoir for low service and into a standpipe for her high service; area about 160 acres. The increase in consumption and other causes covering several years drew the water down some 14 feet, which made it necessary to place a temporary pumping plant on the border of the pond to supply the conduit running to the large pumps. The extension was the laying of a 30 and 36 inch iron pipe about 9 miles long, the building of a dam some 30 feet high and 850 feet long in Waltham, all completed a month ago. We can deliver at the pond ten million gallons daily."

COLUMBUS, O.—It is probable that there will be considerable sewerage work here soon.

MARION, IA.—Our correspondent writes concerning the report of the incorporating of water-works here: "Our works have been running about one year, although we did not incorporate until a few months since. Our system is not entirely completed, having several miles of mains to lay next season. We contemplate purchasing an additional boiler of about 65 horse-power."

NEWPORT, N. H.—Efforts are being made to organize a company here to furnish water from Sunapee Lake.

MARION, VA.—Water-works are to be constructed here in the spring.

SCENEGA, CAL.—The Pirie Water Company has been incorporated with a capital stock of \$20,000. Robert Strathearn, J. M. Horton and others are the incorporators.

McMinnville, Tenn.—It is rumored that a 40-foot water-tank is to be erected here and that water-mains are to be put in the principal streets.

FRANKFORT, MICH.—A special election has been ordered by the Village Council, to be held some time in January, to decide whether or not water-works shall be established here.

KANSAS CITY, Mo.—The Buffalo Express of December 23, says: "The Holly Manufacturing Company, of Lockport, N. Y., has received the contract to furnish a 10,000,000-gallon engine for the water-works here."

MILWAUKEE, Wis.—The Fire Department will purchase a 75-foot copper water-tower.

BRIDGES.

SIOUX CITY, IOWA.—There is talk of erecting a \$35,000 bridge here.

NEWPORT, KY.—The Central Railway and Bridge Company, of this city, is about to file an application with the Secretary of War for permission to build a bridge between Cincinnati, O., and Newport, Ky.

FORT SMITH, ARK.—The question of erecting a bridge over the Potean River, at this place, is being agitated, and it is probable that conclusive steps will soon be taken.

MONTGOMERY, ALA.—The Board of Revenue has decided to erect two bridges near this city.

SAN FRANCISCO, CAL.—The Santa Inez Water Company has been incorporated with a capital stock of \$1,000,000. Edgar W Steele, San Luis Obispo, and others are the incorporators

CHICOPEE, MASS.—It is reported that a bridge is to be built here by the County Commissioners.

KANSAS CITY, Mo.—A bridge is to be built here by the Holmes Street Cable Car Company.

McConnelsburg, PA.—J. E. Downs can give information concerning a bridge to be erected here by the County Commissioners.

ST. AUGUSTINE, FLA.—Concerning a report that the County Commissioners were to build a bridge here, our correspondent writes: "We have no bridge to build for next twelve months."

LAUREL, DEL.—Address H. F. Kenny, 233 South Fourth Street, Philadelphia, Pa., General Superintendent Philadelphia, Wilmington and Baltimore Railroad, for particulars concerning a bridge to be erected here.

GREAT FALLS, MONT.—A bridge is to be built here. Address C. Shields, Minot, Dak.

DUNNVILLE, WIS.—A bridge is to be built here by the County Commissioners.

DAYTONA, FLA.—The County Commission-

GAS AND ELECTRIC-LIGHTING.

MANCHESTER, CONN.—The question of electric lights is being discussed by the city officials, and it is probable that something definite will soon be done.

DECATUR, ILL.—It is said that the electric light company at this place will soon want 100,000 pounds of wire.

THOMASTON, CONN.—An electric light company has been formed here for the purpose of proceeding at once towards lighting the city. The capital stock is \$20,000, and Aaron Thomas, B. W. Pease and others, are the incorporators.

LOCK HAVEN, PA.—An electric light company has been formed here, with Samuel Christ, T. C. Kintzing and others, as incorporators. The capital stock is \$20,000.

ARLINGTON, N. J.—An electric lighting plant is to be erected here by the Thomson-Houston Electric Light Co., of Boston, Mass.

ATHOL, MASS.—The citizens of this place are talking of establishing an electric-light plant.

LOCKPORT, N. Y.—Parties owning the gas-wells at Getsville, ten miles south-west of here, have signified their intention of acquiring the right of way to this city and constructing a natural-gas pipe-line here. They propose to light and heat the city. They have five wells already sunk at a depth of 500 feet each, and claim they will have an unlimited supply.

HOMER, N. Y.—It is rumored that the local water-works company will light the public streets by electricity.

ELMIRA, N. Y.—Natural-gas has been struck near here, and a company has been formed to further operations.

DETROIT, MICH.—The contract between this city and the Brush Electric-Light Company, to light the public streets for the next three fiscal years, has been executed.

CHARLESTON, W. VA.—It is reported that this place is to be lighted with e'ectricity by the Kanawha Electric-Light Company.

FREEBORN, MINN.—Natural gas has been discovered here, and it is probable that a company will be formed.

GREEN COVE SPRINGS, FLA.—An electriclight plant is to be erected here by the Green Cove Electric Company.

CHAMBERSBURG, N. J.—The question of electric-lights is being agitated here, and the Light Committee of the Common Council has been given power in the matter.

FORT GRATIOT, MICH.—This place will pipe for natural gas at once.

THE Gas and Electric Light Company, of York, Neb., has been incorporated. Capital stock, \$8,000. D. E. Sedgwick, M. Sovereign and others are incorporators.

RUTLAND, VT.—The Rutland Electric Light Co. has increased its capital stock by \$25,000 and will make extensive improvements to their plant.

PLAINVILLE, N. Y.—There is talk of having a natural-gas stock company here.

HOLLAND, MICH.—The place has decided in favor of electric lights.

PIQUA, O.—The Mercer Gas and Fuel Company has been incorporated; capital stock, \$700,000. George H. Smeiley, James B. Townsend, and others are corporators.

MAUCH CHUNK, PA.—A company with a capital stock of \$1,500 has been organized here for the purpose of lighting the streets with electricity.

LAMAR, COL.—This place is to be lighted by electricity. T. J. Matthews and others have formed a company with \$50,000 capital stock.

RAILROADS, CANALS, ETC.

BRIDGEPORT, CONN .- At the annual meeting of the stockholders of the Housatonic Railroad Company it was voted to build a branch line from Newton to Huntington, a distance of ten miles.

HELENA, ARK .- The Helena Street Railway Company has been organized, with W. W. Schoolfield, H. G. Miller and others, as directors. Work will be commenced as soon as the weather permits. Mr. John Gunn. of Memphis, will probably have charge of the construction of the road.

KANSAS CITY, Mo.—It is reported that H. P. Selden, 535½ Walnut Street, has been awarded the contract to construct a line of railway for the Kansas City, Rich Hill and Standard Reilman Contract of the Contra Southern Railway Co.

FIRE ESCAPES, ETC.—Proposals are wanted at Washington, D. C., until January 2, for erecting fire escapes, stand pipes, platforms, and ladders on the public school houses in the city of Washington, D. C. Address William Ludlow, Engineer Commissioner.

SCHOOL ADDITION.—Proposals are wanted at Milwaukee, Wis, until January 6, for building an addition to 8th Ward school-house. Address H. P.

1RON FITTINGS.—Proposals are wanted at Mil waukee, W.s., until Japuary 2, for iron fittings for County jail. Address Frederick Wilkins, County Clerk.

WATER-WORKS.—Proposals are wanted at Dallas, Tex., until January II. for constructing, etc., two storage and subsiding reservoirs, according to specifications. Address W. E. Parry, City Secretary.

WATER WORKS,—Proposals are wanted at Hillsborn, Ill., until January 12, for constructing waterworks. Address the City Clerk.

LABORATORIES.—Proposals are wanted at Worcester, Mass., until D cember 31, for building laboratories for the Worcester Polytechnic Institute. Address Stephen C. Earle, Architect, 492 Main Street.

SEWERS.—Proposals are wanted at Williamsport, Pa., until January 18, for the construction, etc. of sewers in ceitain streets. Address R. H. Faries, City Engineer.

Building Intelligence.

We solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

ABBREVIATIONS.—b s, brown stone; br, brick; br st, brick store; bs dwell, brown-stone dwelling; apart house, apar' inel-house; tes, tenement; e, each s, owner; a, architect; b, builder; fr, frame.

Bacon and N Market sts. 5 adj br dwells; cost, \$16,000; o, M Trendeville; a, J H Kearney.

KANSAS CITY, MO. - 53 minor bldgs aggregating in cost \$28,500

None costing \$7,000 or over. STILLWATER, MINN .-- John Glaspie will

erect a brick block.

MINNEAPOLIS, MINN.—C S Moore will erect a \$20,000 brick block on West Seventh

WATSESSING, N. J.—An Episcopal church will be erected here, at a cost of \$20,000.

SYRACUSE, N. Y .- The congregation of St James Episcopal Church, Syracuse, will erect a new building.

PORTLAND, ME .- The First Presbyterian Church congregation is to have a new build-

COLUMBUS, O.—A United Presbyterian church is to be erected in this city.

COLUMBIA, PA.—The Presbyterian congregation of Columbia contemplates erecting a new church.

DETROIT, MICH.—The people of Plymouth Congregational Church will build an edifice, to cost \$100.000. The architects edifice. to cost \$100.000. The a are Spier & Rohns, 54 Buhl Block.

MILFORD CENTRE, O .- The Chicago, Sr Louis and Pittsburg Railway Co will build a depot here. John F Miller, Colum-bus, the General Superintendent, can give details.

SAGINAW, MICH.—The Flint & Pere Marquette Railway Co has decided to build a depot here. Sanford Keeler, East Saginaw, is in charge.

OMAHA, NEB .- The Burlington and Missouri River Railroad Co in Nebraska, will build a depot in this city. T. E. Calvert, Lincoln, General Superintendent.

FORT WAYNE, IND.—The congregation of St. Paul's German Lutheran Church will build a \$75,000 edifice.

DENVER, COL.—The members of the Evans Methodist Church will build an edifice, to cost \$65,000.

MORRISTOWN, N. J.—The members of St Peter's Church. Morristown, will build an edifice. The estimated cost is \$110,000.

NEWPORT, R. I.—The Masonic Society will make improvements to their building to cost \$17,000.

BIRMINGHAM, ALA.—The Masonic lodges will build a large structure here.

PITTSBURG, PA.-The Fidelity Trust Co., 434 Wood Street, will erect a building to cost \$100,000.

CANTON, O -The Y. M. C. A. will erect a new headquarters in this city.

FINCASTLE, VA.—A large building is to be built here by the Y. M. C. A.

KANSAS CITY, MO .- A new building here by the Hyde Park Club.

WETUMPA, ALA.—The Masonic Society contemplates building a large edifice. EAST HAVEN, CONN .- The New York,

New Haven and Hartford Railroad Co. will build a depot here. O. M. Sheppard, New Haven, can give information.

DERBY, CONN.—The New Haven and Derby Railway Co. will build a depot at this place. E. S. Quintard, New Haven, is the superintendent.

CRYSTAL SPRINGS, N.Y.—A large hotel is to be erected here. Address J. J. Paddock.

SEA ISLE CITY, N. J.—P. A. Somerset will erect a \$60,000 hotel here. WEST NEWTON, PA .- Henry Croushore

will build an opera house here. NARRAGANSETT PIER, R. I.-Address H W Green for particulars concerning a \$25,000 hotel to be erected here.

BERKELEY, CAL.—A hotel to cost \$150,000 is to be erected here soon. For full details address Dr. George M Barnibas.

CARMEL, N. Y .-- An almshouse is to be built here by the County Commissioners.

ORANGE, N. J —A \$10,000 addition is to be built to the Orange Memorial Hospital.

BOZEMAN, MONT.-The Commissioners will erect a borough building, to cost \$25,-

SPRINGFIELD, O.—The Y M C A of this city has decided to erect a new building.

ZANESVILLE, O.—A \$60,000 structure is to be built here; Oscar Cobb, of Chicago, Ill., is the architect.

UTICA, N. Y.—Secretary Shurtleff, of the Y M C A, can give information of a \$50.000 structure to be built by this organiza-

ABITA SPRINGS, LA. -Poitevant & Favre, of New Orleans, La., are interested in a hotel to be erected here (P O at Covington); the estimated cost is \$50,000.

THE ENGINEERING & BUILDING RECORD

THE SANITARY ENGINEER.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1887, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 17. NUMBER 5.

EDITORIALS:

PUBLISHED EVERY SATURDAY.

NEW YORK, DECEMBER 31, 1887.

LONDON, JANUARY 14, 1888.

SINGLE COPIES, TEN CENTS. Subscription, \$4.00 per year in advance, post paid, SINGLE COPIES, SIXPENCE. Subscription, 20s. per annum in advance, post paid.

IN AMERICA In GREAT BRITAIN.

THE ENGINEERING & BUILDING RECORD, conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. (P. O. Box 3037). Its opinions upon all technical subjects are either frepared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE. Postage Paid.

> OFFICE IN GREAT BRITAIN. 92 & 93 FLEET ST., LONDON.

TERMS, sor. PER YEAR, IN ADVANCE. Postage Paid. SINGLE COPIES, SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of THE ENGINEERING & BUILDING RECORD (New York), and crossed ———— & Co.

Continental subscriptions are also received by F. A Brockhaus, Esq., Querstrasse 29, Leipzic, Germany, and Asher & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, apan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5. The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by check or money order payable to The Engineering & Building Record.

When a change of address is desired, both the old and new addresses should be given.

THE TENEMENT-HOUSE PROBLEM IN NEW YORK.

UNDER the above title the President of the Health Department of the city of New York, Mr. James C. Bayles, has presented to the Mayor of the city a report intended for the information of the commission on legislation affecting tenement and lodging houses as provided under existing laws. This report, forming a pamphlet of forty-five pages, gives a historical sketch of the various efforts which have been made to improve our tenement-house system, beginning with the report of the special committee appointed in 1856 by the State Legislature "to examine and report upon the condition of tenant-houses in the city of New York." It appears that there are now 30,055 tenement-houses in the city, and that there are forty-four members of the sanitary police charged specifically with the duty of constantly supervising the tenement and lodging houses and the enforcement of the Tenement-House Act, no one member having more than 1,100 tenement-houses under his super-

Mr. Bayles thinks that recent legislation has, to a great extent, given all the powers which the Health Department requires, and says: "Any important addition to our powers from this point of view would be an embarrassment;" or, as it is stated further on, "The Health Commissioners see no reason to ask the help of the Tenement-House Commission in securing increased powers through legislation." It is, however, suggested that the Board of Health should be given the right to file a lis pendens when proceedings are begun against an owner for violation of the rules governing the construction of buildings, and in support of this it is urged that purchasers of real estate should be able to find in the record office, notice of everything which affects the title to such property. "Builders and speculators take a most unfair advantage of the inability of the Health Department to file notices of violation where they will become part of the record and be found in a search of title, and many purchasers are every year surprised to find themselves under the necessity of making expensive alterations to avert heavy penalties for opening their buildings to the occupancy of tenants.'

It is also hinted that the Department of Public Works might co-operate with the Health Department more than it does, by granting permits to connect with the Croton supply only on a certificate from the Health Department that the plumbing regulations have been complied with.

This latter suggestion, we are glad to notice, has since been adopted by the Commissioner of Public Works, and we trust the former will also be favorably acted upon. Certainly, it is a very moderate request, and it seems reasonable and proper that it should be complied with. The whole report is a simple and sensible document, and, while it may possibly take a view of the situation which is rather rose-colored, we believe its recommendations to be wise, and that they should have all the more weight because of the absence of sensational appeal from and the studied moderation in the statements upon which they are based.

A NEW WAY OF SOLVING ENGINEER-ING PROBLEMS.

WHEN a city begins to feel the need of a system of sewerage and of the regulation and supervision of house drainage, there are always several different plans proposed. The best way to secure a proper selection of plan is, as we have often had occasion to state, "to select a competent engineer of good repute and to abide by his recommendations." Dr. Falligant, of Savannah, proposes a new plan. The usual form of controversy as to whether something shall be done to improve the sewerage of Savannah, and, if so, what? has been going on for some time, and, among others, Colonel Waring has recommended his system. Dr. Falligant, of that city, wants a somewhat different system, more especially as to modes of flushing, and offers, through the press, to bet \$1,000 that his own system will work well, the challenge being especially directed to Colonel Waring.

It will be perceived at once that this is a very different matter from offering to bet Colonel Waring that his (Waring's) plan would not work well, or from offering to bet that one plan would work better than the other. In fact, the more we consider the terms of the doctor's wager the more we are led to admire his shrewdness in securing free advertising without risk. But, despite this admiration, and the recognition of the fact that it is easier to bet than to argue, we are still of the opinion that Savannah would do well to abide by the decision of a competent and impartial engineer in a matter of such importance to her health and commercial prosperity as that of a system of sewerage.

GUARD-RAILS ON RAILWAY BRIDGES.

WE give on another page the recommendations of the Railway Commissioners of Massachusetts on the subject of guard-rails for railway bridges, in regard to which they say: "The Board are so impressed with the importance of this subject that they have given careful consideration to the merits and defects of the different forms, and they urgently recommend the general use of the form herein described.'

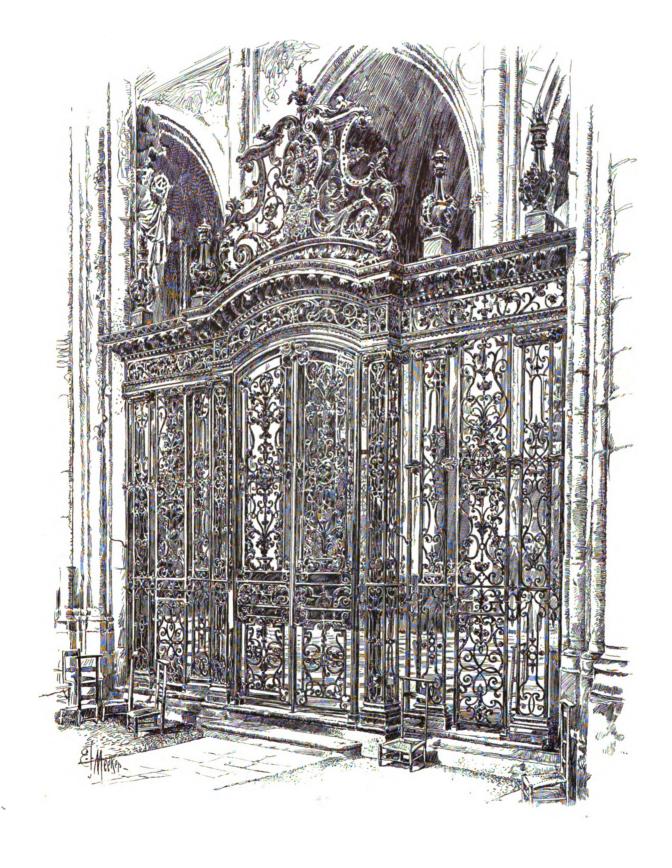

We believe we cannot do our railroad readers a greater service just now than to give them the benefit of this valuable advice on this most important detail of railway construction.

When it is considered that serious derailment on a deck-bridge means a plunge into the river below, and that the same thing on a through bridge adds the wreck of the bridge to that of the train, it will be seen that the importance of guard-rails on railway bridges can hardly be overestimated, and those roads which are properly provided in this respect deserve and should secure the preference of prudent travelers.

SPARE THE CITY HALL PARK.

EVERY citizen who desires to see the remnant of the New York City Hall Park spared to the public and the architectural ruin of the City Hall averted will be gratified to find the New York Tribune joining in the protest against the pro-prosed unwise action of the Sinking Fund Commissioners. In its issue of December 25 it gives generous credit to The Engineering and Building Record and also the Record and Guide of this city, for the stand we have taken in the matter. It quotes from the several articles that have appeared in this journal, the first of

THE ENGINEERING & BUILDING RECORD ILLUSTRATED SERIES.

GRILLES DE L'EGLISE, ST. OUEN, FRANCE.

which was in our issue of August 6. It also quotes from the Syracuse *Standard* and the letter of Mr. Hugh N. Camp, and then makes the following editorial recommendation, which we sincerely hope may be acted upon. The co-operation of the press of this city to prevent so serious a blunder is urgently needed:

"Advocates of the scheme for ruining the City Hall and despoiling the City Hall Park by the erection of a building in the form of two huge 'wings' have been keeping quiet for the last few days; but if they hope that the opposition will die out they are doomed to bitter disappointment Apart from the fact that the law authorizes a building, while two disconnected wings (so called) are planned, it is as clear as sunlight that not a single inch of this park should be surrendered for building purposes. Besides, as the extracts which we print elsewhere show, the proposed building will be an architectural monstrosity. The opinions of journals like THE ENGINEERING AND BUILDING RECORD and the Record and Guide are not to be lightly dismissed. Our City Hall is too noble a specimen of architecture to be experimented with or mangled. The way to settle this business with neatness and dispatch is for the Legislature promptly to undo what it did last year. Pass a bill rescinding the authority given to the Sinking Fund Commission to put up a building for city purposes, or at least amend the former act in such a way as to prevent the threatened outrage. This is a duty which the Legislature cannot afford to neglect."

THE "Novelty in Bridge Erection" illustrated in our issue of November 5 may suggest an arrangement of a draw-bridge that would be convenient in some localities.

A DETAIL in the installation of the new cable tramway at Birmingham, to which previous reference has been made, is interesting. To detect any broken wires the cable passes into the engine-house through an opening very slightly larger than its own dimensions, so that any loose wires will set an electric-bell ringing.

QUESTIONS ABOUT OHIO WATER-SUPPLIES.

DR. C. O. PROBST, of the State Board of Health, will soon send to nearly all places in the State a series of questions, propounded by Dr. H. J. Sharp, of the State Board of Health, in regard to the water-supply and disposal of sewage in the various towns of the State. The replies should contain much valuable information.

THE LONGEST BRIDGE IN ITALY.

THE iron railroad bridge over the Po, just opened at Casalmaggiore, Italy, is much longer than any previously existing in that peninsula. It comprises 17 spans, two of 55 m. at the ends, and 15 intermediate ones of 65 m. each, a total of nearly 3.560 feet. According to La Semaine des Constructeurs the foundations of the 16 piers and two abutments were constructed by the plenum process. One thousand tons of iron were used in building the 18 caissons, which were illuminated during the work by Edison electric lamps. The masonry in piers and abutments is computed at 14,600 cubic metres.

The bridge is single-track, continuous girder, and weighs 2,900 kilos per metre. It was built by the Savigliano shops, in charge of M. Cottrau.

FAILURE TO COLLECT DAMAGES FOR SEWER OVERFLOW INTO CELLAR.

A SUIT brought by a firm of butchers against the city of Milwaukee for damage caused by an overflow from a sewer into their cellar was decided in favor of the city. From the report of the trial it appears that this was a test case, which, if successful, was to be followed by a large number of others.

It appeared by the testimony that it was considered necessary in that section of the city to put back-flow traps on the house-drain to prevent water from the main sewer backing into the cellars, and instances were cited where it had been done in that neighborhood. On the judge's charge that the plaintiffs knew the condition of the sewer in that locality and the precautions of others in the matter of back-pressure traps, the jury found for the city, evidently regarding the plaintiffs as having neglected the precaution that they should have taken.

VIRGINIA.

GUARD-RAILS ON RAILWAY BRIDGES.

THE following explanations and recommendations are taken from a recent circular addressed by the Massachusetts Board of Railroad Commissioners to the railroad companies in that State:

"The object of the guard-rail is to prevent a derailed truck from getting far enough off the track to strike any portion of the girder, or from becoming twisted so as to lead to further derailment. The floor of every bridge should, moreover, be so constructed as to be able to carry safely any derailed car or engine; and for this purpose, the ties should be substantial timbers, measuring not less than six by eight inches, and spaced not more than eight. and preferably four or six inches in the clear. Efficient guard timbers outside of the rails should also be provided, notched on each tie and bolted at short intervals—the object of such timber being to hold the ties in place, and to keep them from being bunched by a derailed wheel. Instead of notching the guard timber over the ties, it may be simply bolted, and spacing-blocks securely fastened between the ties to keep them apart.

"In addition to such guard-timbers, guard-rails are requisite, so arranged as to bring a derailed truck nearly back to its proper position, and guide it across the bridge without allowing it to deviate more than a few inches from the rails. For this purpose, outside guard-rails and inside guard-rails are in common use.

"The ordinary arrangement of outside guard-rails is as follows: The guard-timbers before described are placed six or eight inches from the rails, and are sometimes protected with an angle-iron fastened to the corner. At the ends of the bridge, or on each track at the end at which trains enter upon the bridge, curved rails extend from these guard-timbers, flaring outward and resting on long ties.

"The board recommend the use of the inside guard_ rail, placed with a clear space of from seven to ten inches between the heads of the guard-rail and the track-rail. securely spiked to the ties, and with ends running to a point in the centre of the track on the side from which trains approach. The distance of this point from the end of the bridge should vary in different cases, but should not be less than thirty feet, and preferably sixty feet on important bridges. If the approach is on a curve, the guardrail should be carried farther; and on sharp and short curves it is advisable to extend them entirely around the curve, or to run them to a point thirty or sixty feet from the bridge, and from this point to carry a single rail in the centre of the track around the curve. The point of the guard-rail should be protected by an old frog point or by a bevelled wooden block to prevent any hanging chain from catching on the end. The distance between the track and the guard rails should be sufficient to allow a wheel to run between them without crowding either rail, or from seven to ten inches.

"The board consider that this form of guard-rail is much more efficient than the outside guard-rail in bringing a derailed truck back to its proper position. On many roads the outside guard-rails extend but a short distance beyond the ends of the bridge, and are frequently curved abruptly so as to be nearly at right angles with the track. Furthermore, the long ties on which such guard-rails rest are generally insufficiently bedded in the ballast outside of the rails. The tendency of such a guard-rail is to stop the wheel which strikes it and to twist the truck still farther, placing it at a greater angle with the track, and thus tending to increase rather than to diminish the danger of an accident. The board consider such guard-rails to be worse than useless, and recommend that they be replaced by inside guard-rails without delay. Outside guard-rails of proper length, slightly curved and properly laid, may accomplish their intended purpose, but they are wrong in principle, because they are struck by the wheel at the wrong end of the axle, and if they do their work at all, they do it at great disadvantage.

"The objection is sometimes urged against inside guard-rails that a mischievous person may place an obstruction between the guard and track rails, or that some obstruction may accidentally get there. The board believes that this argument has no practical weight, and that even if a truck were derailed in this manner it would, by virtue of the guard-rail, pass safely across the bridge. A person who desires to wreck a train can find abundant means of doing it more effectual than this. Further objections are sometimes pleaded that the use of the snow-plough is rendered difficult, or that a hanging chain may catch on the point

of the guard-rail. These also appear to the board to have little weight. The points may be protected as already explained, and the use of the snow-plough is no more interfered with than at any turnout or crossing. Finally, it is sometimes urged that a truck, if derailed far enough to get on the wrong side of the point, would be still further deviated by the guard-rail.

"As long as a train holds together it is very rare for a truck to be off the track more than a few inches or a foot. If the train has parted and a truck is off by as much as one-half of the guage, the wheels on one side of this truck would be off the ties and a smash-up could hardly be averted, no matter what shape of guard-rail were applied. Certainly the ordinary form of outside guard-rail would do no good. Furthermore, the possibility of such an accident at a bridge may be almost completely removed by extending either the guard-rails or a single guard-rail on curved approaches, as has been suggested."

DESTROYING THE FIFTH AVENUE PAVE-MENT.

WE are glad to see the *Times* call attention to the fact that the Fifth Avenue pavement is taken up in spots, the foundation destroyed, and when the blocks are replaced they are simply put back in the sand. We noticed an instance of this kind in front of the residence of Mr. Cornelius Vanderbilt last week. On inquiry, the man in charge stated that the blocks were put back temporarily. We shall watch with interest to see when the concrete foundation is properly restored. Our opinion is that every opening of this kind would better be enclosed and travel over it prohibited until the department can restore the foundation and pavement properly. These temporary repairs simply result in making a series of depressions in the whole street, and breaking down the edges of the sound pavements.

If such makeshifts were not tolerated at all, but the disturbed places kept inclosed until perfectly restored, it would hasten such restoration and in the end save much inconvenience and expense.

THERE is likely to be some little discussion in the Private Bills Committee, when Parliament again meets, with regard to the new Tay Bridge. The Board of Trade officials, after inspection, have recommended that the piers of the former bridge should be left standing. The new Tay Bridge Viaduct Act provides that the railway company shall remove the ruins and debris of the old bridge and all obstructions interfering with navigation caused by the old bridge, to the satisfaction of the Board of Trade, although the Board of Trade officials now recommend the retention of the piers. The officials of the city of Perth are opposed to their retention, claiming that they cause an obstruction to navigation which would be detrimental to the interests of their city.

A PNEUMATIC DREDGE AND CONCRETER.

THE Revue Industrielle contains a description of a machine recently built in France upon the system of M. H. Jandin, to excavate for laying sea wall and jetty foundations at the Phillippine Isles. The place excavated will be surrounded by sheet piling, and the material removed will be discharged directly at a distance of 100 m. by compressed air from a pneumatic chamber through a conduit with flexible metallic elbows. The same apparatus will serve to fill the excavated space with beton carried under water by pipes that preserve it from dilution, distribute it regularly, and even ram it by successive pneumatic or hydraulic impacts.

ROTARY SNOW-SHOVELS.

THE Pioneer Press states that the Northern Pacific will this year put into use along its line four new rotary steam snow-shovels. These rotary shovels have never been used in the Northwest, although they have been thoroughly tried elsewhere. The apparatus somewhat resembles a box car containing a stationary engine, which works the shovel. On the front of the car is the rotary shovel, which gathers up the snow, and it can be run as fast as three hundred revolutions per minute. The snow passes back and is expelled from a spout on top of the car, being thrown far to one side. The apparatus is pushed by a locomotive, and can go through a snow-drift six or seven feet deep at the rate of fifteen or twenty miles an hour.

PAVEMENTS AND STREET RAILROADS. No. XXIV.

(Continued from page 54.)

SPECIFICATIONS FOR PAVING MATERIALS. PARISH OF CHELSEA.

Specification for the supply and delivery of wood blocks for paving portions of the streets known as King's Road and Pont Street, in the Parish of Chelsea.

1. Blocks.—The wood blocks are to be the best approved Swedish yellow deal, cut from Gothenburgh thirds, and are to be 9 inches long, 3 inches wide, and 5 inches deep. Notwithstanding any custom of trade, or any meaning usually attached to the description of blocks as "9 inches long and 5 inches deep," the length of the blocks to be supplied shall be such that when any twelve blocks are placed end to end in a straight line, so as to have their lengths in the same direction, the total length of the twelve blocks shall not be less than 8 feet 0 inches, and lengths in the same direction, the total length of the twelve blocks shall not be less than 8 feet 9 inches, and when any eight blocks are placed in an upright position, with their sawn faces in contact, the height of the eight blocks shall not be less than 3 feet 3 inches. With the approval of the surveyor to the vestry, blocks of a less length than will comply with the above requirement may be supplied, but in such a case the contractor is to supply such a number of blocks to each thousand, at his own cost such a number of blocks to each thousand, at his own cost and without payment from the vestry, as will make a total length at least equal to the length of the blocks as specified; but the number of such blocks of a less length shall not be more than one-third of the total number supplied, nor shall any block be of a less length than eight inches. The blocks are to be sound, square, properly and uniformly cut, free from sap, shakes, warps, large or dead knots, and other defects. A sample of blocks can be seen

at the office of the surveyor to the vestry.

2. Surveyor may inspect works where blo ks are cut, etc.

The surveyor to the vestry, or other person authorized by him, may, at all times during working hours enter the saw-mills, wharf, or other place of the contractor where the blocks are being cut, to examine the same, and may reject any deals or timber from which the blocks are about to be cut which, in his opinion, are unfit for the purposes

of this contract.

3. Number of blocks and delivery.—The contractor is to supply 640,000 blocks, of which 340,000 are to be supplied to King's Road, from Limerston Street to Lot's plied to King's Road, from Limerston Street to Lot's Road, and 300,000 to Pont Street, but the vestry reserve the right to take a less number, or to require the supply of a greater number. The blocks are to be delivered on the streets named at any part thereof, or on any of the side streets within thirty yards of such streets, and are to be stocked in such manner and at such times and places as stacked in such manner and at such times and places as the surveyor to the vestry shall direct. The contractor will not be required to deliver a greater number of blocks

than 20,000 per day.

4. Vestry may obtain other blocks if contractor fails to deliver.—The contractor is to commence the delivery of the blocks within ten days after the receipt of an order in the blocks within ten days after the receipt of an order in writing from the surveyor to the vestry, and is to proceed with such delivery in such quantities, and at such times as the said surveyor shall direct. The said surveyor shall have power to suspend the delivery of the blocks, as he thinks fit, on giving twenty-four hours' notice to the contractor, without any charges which may arise in consequence, being chargeable to the vestry.

5. Blocks to be approved by surveyor.—The blocks supplied are to be subject to the approval of the surveyor to the vestry, and any blocks which are not approved by him are to be removed from the works within six hours. The blocks are not to be considered as approved until they are

are to be removed from the works within six nours. Ince
blocks are not to be considered as approved until they are
laid in the streets as part of the pavement and grouted in.
A sum of ten shillings per thousand will be deducted from
the payments to be made under this contract to the contractor by the vestry, for every thousand of the blocks so
delivered on the works and not approved. If the condelivered on the works and not approved. If the contractor fails to remove the Llocks not approved in the time

allowed, the vestry may do so at his expense.

6. Pena ties if works delayed for want of blocks.—If the works are delayed or hindered by reason of the non-delivent ery of a sufficient number of blocks, the contractor shall pay to the vestry the sum of £10 per day or part of a day they are so delayed, and the vestry or their surveyor may obtain blocks from any person they think fit, and may deduct the extra cost of such blocks (if any) from the payments to be made to the contractor under this contract, together with the sums to be paid by him to the vestry for the delay of the works, or may recover such extra cost and sums from him or his sureties as and for liquidated

damages, as they deem best.
7. Payment.—Payment will be made to the contractor in monthly installments for the blocks laid in the street as part of the pavement on the certificate of the surveyor to the vestry.

8. Surveyor's decision to be final.—The decision of the surveyor to the vestry as to the meaning of this specifica-tion, or as to the quality or number of blocks supplied is to be final and binding.

George R. STRACHAN,

February 21, 1996 February 21, 1886. Surveyor to the Vestry.

Specifications for the supply and derivery of Than es bal last, sand, and pea gravel for paving portions of the streets known as King's Road and Pont Street, in the parish of Chelsea.

Thames ballast.—The Thames ballast is to be taken from the River Thames, the stones are to be regular in size, and not to exceed three inches in any dimension, the sand clean and free from clay, mud or loam, and the proportion of sand to stones is to be to the satisfaction of the

2. Sand.—The sand is to be pit sand or Thames sand of the best quality, clean and sharp, free from loam or clay, and when screened through a sieve of 400 meshes to the square inch no residue must be left.

3. Pea gravel.—The pea gravel is to be of clean water-worn stones, not exceeding three-eighths of an inch in any dimension.

4. Quantity.—The contractor is to supply the quantities of materials set forth in the form of tender of this specification; but the vestry reserve the right to take a less quantity or to require the supply of a greater quantity of any or all of them. They are to be delivered on the streets named, at any part thereof, or on any of the side streets within thirty yards of such streets, at such times and places as the surveyor to the vestry shall direct. The contractor will not be required to deliver more than 100 cubic yards of Thames ballast, 20 yards of sand, or 10 yards of pea

gravel per day.

5. Delivery.—The contractor is to commence delivery 5. Delivery.—The contractor is to commence genery within seven days after the receipt of an order in writing from the surveyor to the vestry, and is to proceed with such delivery in such quantities, and at such times as the said surveyor shall direct. The first order will be given on the 10th March instant. The said surveyor shall have power to suspend the delivery as he thinks fit, on giving twenty-four hours' notice to the contractor, without any charges which may arise in consequence, being chargeable to the vestry.

6. Materials to be approved by surveyor .supplied are to be subject to the approval of the survevor to the vestry, and any which are not approved by him are to be removed from the works within six hours. If the contractor fails to remove the materials not approved in the time allowed, the vestry may do so at his expense.

7. Measurement and approval.—The contractor is to bring an invoice with each delivery, stating the quantity and nature of the materials supplied, which is to be left with the person appointed by the surveyor to the vestry to receive such materials. If the contractor provides such invoice in duplicate, the person so appointed will sign and return it to the carter, if the quantity and nature of the materials are correctly stated thereon, and the production of such duplicate invoice, so signed, will be accepted by the surveyor to the westry as proof of delivery of the quan-tity of the materials signed for. The materials supplied may be measured by the surveyor to the vestry, or any person whom he may appoint, in the cart in which it is brought on to the works, or on the ground, as he thinks fit. If the measurement is found to be short of that stated on the invoice, the cost of measurement shall be paid to the vestry by the contractor. The materials are not to be considered as approved until they are used on the works.

Here follow the same clauses as to delay, payment, etc., as in the specification for blocks.

GEORGE R. STRACHAN, Surveyor to the Vestry. March 3, 1886.

Specification for the supply and delivery of Portland cement, for paving portions of the streets known as King's Road and Pont Street, in the Parish of Chelsea.

I. Cement .--The cement is to be the best Portland cement, very finely ground, weighing 112 pounds to an imperial striked bushel, capable of sustaining a breaking weight of 420 pounds per square inch of sectional breaking area after seven days' immersion in water. It is to be delivered in sacks containing two bushels, each bushel weighing 112 pounds net.

2. Quantity and delivery.—The contractor is to supply 5,000 sacks of cement, of which 2,660 are to be supplied to King's Road, from Limerston Street to Lot's Road, and 2,340 to Pont Street, but the vestry reserve the right to take a less number or to require the supply of a greater number. The sacks of cement are to be delivered on the streets named at any part thereof or on any of the side streets named at any part thereof, or on any of the side streets within thirty yards of such streets, and are to be stacked in such manner and at such times and places as the surveyor to the vestry shall direct. The contractor will be required to deliver the cement in lots of 500 sacks at a time, and to complete the delivery of each lot within seven days after the order is given. The order for the first lot will be given on the 10th March inst., for the second lot on the 11th March inst., and for the remaining lots at intervals of about seven days from the 11th March inst. The surveyor to the vestry shall have power to increase the length of these intervals, or to suspend the delivery of the cement on giving twenty-four hours' notice to the contractor, as he thinks fit, without any charges which may arise in consequence, being chargeable to the

3. Testing and approval.—When each lot is delivered, the vestry will watch and cover it at their own expense until it has been tested. The surveyor to the vestry will cause samples of each lot to be taken and tested as to its breaking weight, and will cause other samples of each lot to be weighed and measured. If the samples so taken comply with clause of of this specification, the lot from which they were taken will be approved by the vestre and which they were taken will be approved by the vestry and their surveyor, and the expense of the tests and measurements will be borne by the vestry. It, however, they fail to comply with clause I of this specification, the lot will be rejected and the contractor shall, at his own expense,

remove the cement within forty-eight hours after notice of its rejection from the surveyor, and shall pay to the vestry the cost incurred by them in testing and measuring the lot so rejected. If the contractor fails to remove such

cement the vestry may do so at his cost.

4. Sacks.—The contractor is to bring an invoice with each delivery of cement stating the number of sacks sup-plied in such delivery, which is to be left with the person appointed by the surveyor to the vestry to receive the cement. If the contractor provides such invoice in duplicate, the person so appointed will sign and return it if the number of sacks delivered is correctly stated thereon, and the production of such duplicate invoice so signed will be accepted by the surveyor to the vestry as proof of delivery of the number of sacks of cement and of the sacks stated thereon. The empty sacks will be returned to the contractor on the works as the cement is used, and are to be removed and signed for by 1 im at his own cost within twenty-four hours after notice from the surveyor to the vestry. The vestry will not make any payment for the use of the sacks, but will pay the sum of one shilling for every sack not returned within two months after its delivery on the works.

Here follow the same clauses as to delay payment, etc., as in the specification for blocks.

GEORGE R. STRACHAN,

March 3, 1886.

Surveyor to the Vestry.

(To be continued.)

THE PROTECTION OF PILES FROM LIMNORIA AND TEREDO.

BY MARSDEN MANSON, MEM. AM. SOC. C E.*

In June, 1882, ninety-nine piles, prepared by various methods to protect them from the limnoria and teredo, were driven in Mission Street pier, then being constructed at San Francisco. After an exposure of five years and four months one or more of the piles prepared by each method and four unprepared, with bark left on, were removed for examination.

The following is a brief description of the different modes of treating these piles and the results:

A. W. Von Schmidt prepared two piles by jacketing the driven piles with sewer-pipe and filling the space between the pile and pipe with concrete or grout, composed of sand, gravel, and Portland cement, costing 75 cents per lineal foot, or \$30 per pile. The pile examined was only attacked by teredo where two sections of sewer-pipe had been broken, and had lost thereby one-fourth or one-fifth of its original strength.

F. Shay's process cost 25 cents per foot, or \$10 per pile. His method was a modification of the Culver process, which is a covering of asphaltum and burlap. The modification consisted in the substitution of wire cloth for the burlap. A coat of asphaltum was applied to the pile, which was then wrapped with wire cloth, then another coat of asphaltum was applied and sprinkled with sulphate of lime. The piles removed broke in drawing. Only a trace of the covering was left.

J. McKeon & Co.'s process of coating the piles with marine cement was worthless.

W. H. Raye's process of covering piles with Portland cement and some secret ingredient was also worthless.

Pearce & Beardsley's coating was another modification of the Culver process, and consisted of a covering of burlap saturated with a mixture of naphtha and carbon bisulphide, with a small proportion of limestone, kaolin, sawdust, and sulphur. One pile removed was practically destroyed. There were driven on the westerly portion of this pier at the same time two unprotected cedar piles which were only slightly attacked.

The coatings applied by the various experimenters which depended upon adhesion to the piles utterly failed to afford even the protection given by the bark. Of the eight piles removed which had been coated by the Shay, McKeon, Pearce & Beardsley, and the Raye methods, but one retained sufficient strength to permit its removal without breaking, and this one was more severely attacked and damaged than any of the unprotected piles which were

mr. F. Collingwood, in discussing the paper, mentioned a pier that had been built at Newport News, Va., with unprotected piles, and the worms went through them in every direction; now the owners are expending more than every direction; now the owners are expending more than the whole cost of the original pier in substituting creosoted piles. They are using a wood creosote which the Government endorses, but it does not appear from experiments to be quite all that was claimed for it. The substance which is most effective as a preservative is said to be "dead oil." There is a decided difference between the taste of the dead-oil creosote and that of the wood-oil creosote. The bitter principle which the taste detects is said to be the important element in repelling the worms. The paper was also discussed by Messrs. Flagg, Thompson, Bogart, and Striedinger.

*Abstract of a paper read before the American Society of Civil Engineers, December 7, 1887.

THE WATER-SUPPLY OF BOMBAY.

WE reprint below an interesting article from the Engineer, by Mr. Killingworth Hedges, M. I. C. E., on the Tansa water-supply of Bombay, to which reference was made on page 349 of Volume XVI., and have reproduced the illustrations from the same source:

"I have britfly referred to this important scheme, which it is calculated will afford a water-supply for the city of Bombay amply abundant for all future requirements, and it is calculated will afford a water-supply for the city of Bombay amply abundant for all future requirements, and now propose to give some details of the work, which is in active progress under the superintendence of Mr. W. Clerke, C. F.., whose designs are being carried out. From the site of the dam to the boundary of the island of Bombay the distance is 53½ miles; the water will be conducted by gravitation from one point to the other by tunnels 2½ miles long, conduits 26¼, and iron pipes for the remaining 24¾ miles. The capacity of the tunnel and conduits as designed is sufficient to deliver 33,000,000 gallons daily, or about forty-five gallons per head—in addition to all the present sources of supply—according to the population of Bombay returned in the last census. It is not intended to utilize these large conduits and tunnels to their full capacity at present, and it has been decided to lay a single line of 48-inch iron pipes and raise the dam to a height which will give a supply of 17,000,000 gallons of water daily, without exceeding a fall of six inches per mile for the conduits and tunnels. The area of the artificial lake at Tansa, which is being formed by impounding the water of the Tansa River and building a dam in the first instance 118 feet high above the river bed, will be 8 square miles; the area from which the rainfall is collected is over 52 square miles, and all sources of impurity, such as villages and houses, are being removed from this district, The rainfall of the Tansa valley is on average about 100 inches, and Mr. Clerke estimates that the available run-off would be one-third of the rainfall, and states that after making allowances for evaporation and absorption, there will be sufficient storage to provide for a supply of 60,000,000 gallons per day for a whole year. In absorption, there will be sufficient storage to provide for a supply of 60,000,000 gallons per day for a whole year. In order to impound this vast quantity of water, a masonry dam of exceptional size has been designed, which will be 8,500 feet long, 100 feet wide at base, and 12 feet at top; the greatest height, where it crosses the bed of the Tansa River, is 118 feet. The drawing, Fig. 1, shows the sec-

10 5 0 10 20 30 40 50 60 70 80 90 100 11c 120 SCALE OF FFFT - RANKINE'S DAM B-LIVERPOOL WATERWORKS C-TANSA WATERWORKS 62.75 FIG.1 56.20 106 80 5.80 109.20 \$10.75 155.93 SECTIONS OF TANSA AND OTHER DAMS

tion of Mr. Clerke's dam and also the relative cross-sections

tion of Mr. Clerke's dam and also the relative cross-sections of the dam projected by the late Professor Rankine, who was consulted when the water-works scheme was originally proposed, also the dam which is being erected for the Liverpool Water-Works. The sections of each dam can be identified by referring to the lettering C, A, and B.

"It will be seen that Mr. Clerke's dam provides for considerable saving in material compared with that of Professor Rankine; special arrangements are also designed for carrying off the surplus water by means of a waste weir 1,800 feet long, also for drawing off the supply from the lake. The outlet works are shown in plan and elevation in Figs. 2 and 3. Figure 4 is an enlarged plan of the weir 1,800 feet long, also for drawing off the supply from the lake. The outlet works are shown in plan and elevation in Figs. 2 and 3. Figure 4 is an enlarged plan of the outlet, which consists of a pair of sluiceways G and H, each 2'5"x2', which are cut through the solid rock itself, which rises to this level. These sluices are closed by castiron gates worked by screw-gearing from top, and they are fixed on the inner side of the dam and discharge into a circular cistern, from which the duct will lead off These circular cistern, from which the duct will lead off These two sluices, with only one foot of head, are sufficient to draw off the greatest quantity of water that will ever be required, and nothing further would be necessary were it not for the desirability of drawing off from different levels, according to the level of the water in the lake. For this purpose it is intended to use a single sluice of the same pattern at two other points where the rock foundations are at a convenient height from the top of the dam. Figures 2 and 3 show the position of these sluices, which each discharge into a small square cistern connected with the abovementioned circular cistern by a masonry channel built along mentioned circular cistern by a masonry channel built along the outer toe of the dam, as shown in Figure 2. The upper sluice is to be used until the water falls to such a level that the sluice does not discharge sufficient quantity;

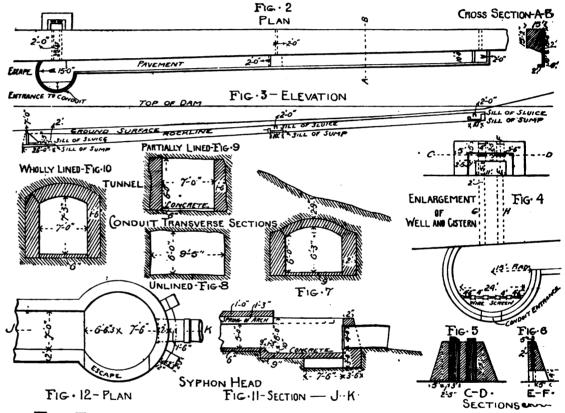

it will then be supplemented by the middle sluice, and in a similar manner the lower sluice may be worked when the level of the lake falls below that of the middle one. upper sluice would be exposed every year, and could be examined and kept in perfect order; probably the middle sluice would also be exposed or could be got at, but in order to obtain access to the lower sluices a well is built order to obtain access to the lower studes a well is built round them as shown in Fig. 4, which communicates with the lake by two openings, each 4x4 feet. Should it be desired to examine the sluices these openings can be closed by needles or vertical bars of timber 4x4 inches, let down through grooves left in the well for the purpose, as shown in Figs. 5 and 6, which are sections at C D and E F on

Fig. 4.

'In calculating the strength of the dam Mr. Clerke has used M. Bouvier's methods; the maximum pressure on Jused M. Bouvier's methods; the maxinum pressure on the down-stream face is 125 pound per square inch, and according to M. Bouvier's calculations, masonry built of good hydraulic mortar after it is ten years old may be safely subjected to a pressure of 187 pounds per square inch, which gives a good margin of stability even if the dam be raised to its final height of twelve feet above what will be the present elevation.

"The duct leads off from the circular cistern, which re-ceives the water from the outlet sluices. This duct, for the greater part of the distance, has been laid out as a conduit so as to minimize the amount of tunnelling. The transverse section of the conduit is shown by Fig. 7, and

line of piping, where it joins the conduits, the junction will be formed by a masonry cistern or syphon head, 15 feet in diameter, as shown by Figs 11 and 12, from which the pipe will take off at its head and discharge at its tail. feet in diameter, as shown by Figs 11 and 12, from which the pipe will take off at its head and discharge at its tail. A sluice-valve has been designed to work inside the syphon head by which the supply can be cut off in event of the pipe bursting, and each cistern is provided with an overflow or escape for passing off water to the nearest 'nalla,' or natural watercourse, in the event of the syphon-valve being closed. For laying the lines of pipes up and down the steep sides of the hills which are found between the head works at Tansa and Bombay, special precautions are being taken. At short intervals the pipes are built into heavy pillars of masonry, founded on hard ground, so as to prevent sliding or creeping. Scouring-valves and air-escape valves are provided at the principal depressions and summits along the lines of pipes. The head of water in the different lines of pipes differ considerably, varying from 104 feet to 256 feet. Where the maximum head exceeds 190 feet, the thickness of the pipes is 1½ inches; where less than 190 feet, 1½ of an inch is considered sufficient. Of the total length of waterway from the Tansa Lake to the reservoir to be constructed at a terminal point 48½ miles off, 28¾ miles will consist of tunnel and conduit, and 19¼ miles of syphon pipes. The only engineering work of importance on the line of main is the bridge which will carry the pipe across the Bassein Creek, and this is now being erected. The piers and

FOR THE WATER SUPPLY OF • THE TANSA WORKS BOMBAY .

will necessitate about ten feet of cutting to the floor. The cross-section is seven feet wide with five feet depth of water; the fall_is six inches per mile, and its discharging capacity—using Busin's coefficient—is forty-eight cubic feet per second, which is equivalent to twenty-six million gallons per day. The conduits will be provided with manholes every 220 yards, and with means of washing out and scouring at convenient places about half a mile apart. Some tunneling on the line of duct is unavoidable—that is, the length of conduit which would be required to avoid it would be so much in excess of the length of tunneling will necessitate about ten feet of cutting to the floor. is, the length of conduit which would be required to avoid it would be so much in excess of the length of tunneling as to be more costly. The tunnels when lined will have the same width as the conduit, but will be a foot higher. Where lining is unnecessary the cross-section will be 9.5 feet wide by six feet high; the fall will be six inches per mile, and the discharging capacity 33,000,000 gallons per day. Cross-sections of the tunnel are shown by Figs. 7, 8, 9, and 10. Where the line of duct crosses valleys it will consist of cast-iron pipes forty-eight inches in diameter. 8, 9, and 10. Where the line of duct crosses valleys it will consist of cast-iron pipes forty-eight inches in diameter, with a fall at the rate of 3.20 feet per mile. The discharging capacity of this pipe, according to Eytelwein's formula, is 17,000,000 gallons per day. In calculating the rate of discharge Mr. Clerke has used the method of Mr. Fanning, C. E., of Boston, U. S. A., who has studied the question of relative discharge of new and old mains. The amount when clean would, according to this method, be 21,500,000 gallons per day; slightly tuberculated, 20,500,000 gallons; foul, 19,500,000 gallons. So that the discharge from the ordinary formula of 17,000,000 gallons is quite on the safe side. The main is being laid entirely above ground; where an embankment has to be constructed, a width sufficient for two 48-inch mains is provided for, ground; where an embankment has to be constructed, a width sufficient for two 48-inch mains is provided for, allowing for a space between, as it is intended to lay down a tramway to facilitate carrying the pipes, and in the case of a pipe bursting, renewals from the nearest depot of spare materials. At the commencement and head of each

abutments consist of cast-iron cylinders five feet in diameter, filled with concrete, and sunk to a foundation in the river-bed, which, for some of the cylinders, was not reached until 60 feet below the low-water level. These cylinders until 60 feet below the low-water level. These cylinders support lattice girders, with rolled joists placed across so as to carry one line of pipes now, with ample space for a second to be added. In all there are three bridges across the creek, of respective lengths of 400 feet, 1,500 feet, and 400 feet, the height being sufficient to allow of the barges, which use the navigation, passing under. It was originally intended to carry out the erection of the dam departmentally, instead of by contract, but the latter plan has been adopted, the work, however, being directly under the superintendence of the consulting engineer, who has the superintendence of the consulting engineer, who has a residential staff, who, besides directing the work, examine materials employed, and daily test the mortar, which is most carefully made to the engineers' specification."

ANNUAL REPORT OF THE BOARD OF HEALTH OF THE CITY OF TOLEDO FOR THE YEAR 1886. This report is made by the Health Officer, Dr. C. L. Van

Pelt, who states that the general health of the city has been excellent, and reports the annual death-rate at 12.89 per 1,000, based upon a city census giving a population of 72.504, the total number of deaths for the year having been 935. This is an extraordinarily low mortality. The summer of 1886 was very favorable to the health of infants, and Toledo has almost no tenement-house population, which in part accounts for such a small death-rate. We do not learn much from this report as to the condition of municipal sanitation; it is stated that the sewers need ventilating and flushing and that the recommendations made in former

reports need attention as much as they did a year ago.

The expenses of the Health Office for the year were

ST. LUKE'S HOSPITAL, CHICAGO.

THIS hospital, which is considered one of the best of its kind in Chicago, was erected a few years since from the plans of Messrs. Treat & Foltz, architects, of that city. The plans we present herewith were copied directly from their drawings, and show the building as it will be when entirely completed. At present there is but one wing for wards.

The building faces the east, overlooking Lake Michigan, but separated from it by the broad lines of tracks of the lake shore roads. The entrance for patients is in the basement at the end of the long corridor. The entrance for visitors and the management is in the north-east pavilion, by means of a broad flight of steps leading directly to the first story. This wing contains the rooms for bathing, etc., in the basement, the reception and council rooms in the first story, matron's and female nurses' private rooms in the second story, rooms for the male help in the third, and in the fourth story is a large clinical amphitheatre, with ether-room, waiting-rooms, etc. This wing also contain the elevator, which is large enough to admit the longest stretcher, and is moved very slowly. There is a private stairway from the first story to the amphitheatre at the top of the building, besides a larger flight for the use of the nurses and patients.

This central wing, towards the north, contains the general kitchen, pantries, and store-rooms in the basement. In the first story are the dining-rooms, with separate accommodations for the officers, the nurses, and the help. The serving-room is connected with the kitchen by a pri-

vate staircase. A sitting-room for the nurses is also provided on this floor. In the story above is a sewing-room, a writing-room, a prettily finished chapel, giving 110 sittings, and a well-stocked library; all for the use of the inmates of the hospital.

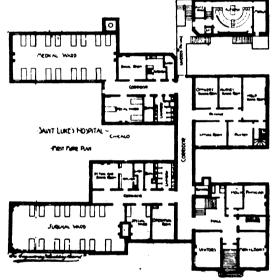

The north-westerly wing contains the fuel-rooms in the basement. Above is the morgue, in connection with a demonstrating amphitheatre, with a small waiting-room for the physician in charge. In the second story is the laundry, with a lift from the basement.

The easterly ward wing will have the dispensary in the basement when completed; also, the waiting and examining rooms for applicants, the offices, an accident room, a druggist's room and stores. In the basement under the other wing all of these departments are at present accommodated, with the exception of the accident-room, for which no provision exists. The final plan contemplates the allotment to this portion of the building of the stores, clothing and linen-rooms for the use of the wards, together with a few sleeping-rooms for the help.

The wards are in two stories, each exactly alike, and as shown by the plans. Each ward has connected with it in the same wing, a sitting and dining-room, a ward kitchen, a linen-closet, lavatories, and a ward for special cases, provided with three beds. The surgical wards are arranged for fourteen beds, and the medical wards for fifteen beds, disposed as shown on the drawings, with one window to two beds. The first-story wards are 15 feet high in the clear, and the second story 16 feet 6 inches. The windows are set up 2 feet 8 inches from the floor, and are made with an opening in the brick-work 4 feet I inch wide, the height of the windows being 11 feet 7 inches. This includes 20 and 22 inch transoms. The outside walls are of brick, built with a central air-space and plastered on

the inside. The ceilings are plastered on wire netting. The plaster-work is tinted in water-colors only. All floors are deafened by a plaster filling between the beams, and the wards are further isolated from each other by the ceiling in first story being furred down so as to leave a clear height of ten inches, this space being utilized in connection with the ventilating-pipes. All corners and angles in the wards are rounded.

The heating of the wards is entirely by steam. Under each window is placed a coil of pipe connected with a fresh-air inlet from out of doors, measuring 14% inches by 22 1/2 inches. This appears to be the only provision made for the introduction of warm, fresh air. For the evacuation of the vitiated air there are openings in the floor under each bed, which are covered with a wire cap raised slightly above the floor. In the space between the floors is a system of ducts connected with the exhaustregisters, and delivering into the large chimney at the corner of the ward, the draft being maintained by the heat from the metal boiler-flue which is carried up in the centre of the chimney. As the space between the floor is only ten inches high, it follows that ten inches is the greatest depth possible for the exhaust ducts, and, according, the ventilating pipe where it enters the chimney has a section of 10x134 inches. The area of the medical ward is about 1,660 square feet. The united sectional areas of all the thirteen outlets is 1,560 square inches, but this area is reduced to 1,340 square inches where the ducts unite to enter the chimney. This is about half the united areas of the inlets under the windows. The exhaust is, however,

supplemented by a large ventilating opening in the wall of the chimney 2x5 feet, and also by the twelve gas-brackets, each of which has a ventilator over it delivering into a flue in the wall.

Two additional stories were added to the west hospital ward during the past summer to be used for small rooms, for the directors, nurses, etc. This was in opposition to the advice of the architects, and the discussions which arose on the subject were so animated that several of the best physicians on the Board of Directors resigned when it was decided to make the addition. The ground was taken that it was contrary to the best principles of hospital planning to build the wings so high when they are placed so close to each other.

The fire-escapes are placed in the angles of the ward wings at the end of the passage leading from the main corridor.

The entire cost of the hospital, as at present completed, is \$145,000. It is estimated that with the new wing the total cost will be about \$190,000. This includes \$26,000 for the work of heating and ventilation, which was done under contract by Bartlett, Hayward & Co., of Baltimore.

Externally the hospital is built entirely of brick. .The location makes any architectural display impracticable, but the design is treated in a simple, quiet manner which is perfectly satisfactory.

The most successful feature of the building is the plan, which is very well adapted for its purpose, giving cross ventilation and plenty of sunshine all the day in the sick wards, and grouping on the north the offices, dissecting-rooms, kitchens, etc., for all of which sunshine is not such a vital consideration. Again, it is well planned in the manner in which the wards are separated from the rest of the building, allowing for an outside door and window immediately beside the entrance to the ward.

THE ENGINEERS' CLUB OF ST. LOUIS.

THE club met December 21, 1887, with President Potter in the chair, Secretary William H. Bryan, and thirty members and two vistors present. The following officers were announced to have been elected at the last meeting: President, M. L. Holman; Vice-President, J. A. Ockerson; librarian, J. B. Johnson; Secretary William H. Bryan; Treasurer, Charles W. Melcher; directors, William B. Potter and F. E. Nipher.

The new president having been duly inducted into office, called upon the retiring president for some remarks appropriate to the occasion. Professor Potter accordingly addressed the club on the present status of the profession and of the Engineers' Club of St. Louis in particular. His remarks were largely historical and he suggested the appropriateness of celebrating the twentieth anniversary of the club's formation, on November 4, 1888, by a social reunion of some kind. A printed catalogue of the club's literature was suggested. The benefits resulting from the Association of Engineering Societies and the journal, with its index department, were referred to. While a closer union of engineering societies might not yet appear desirable, he pointed out a number of ways in which cooperation might result in benefit to all.

A vote of thanks was given Professor Potter for his address, which was ordered published. The address was discussed by Professor Johnson, Messrs. J. A. Seddon, Flad. and Holman.

The secretary then read a paper by Mr. Isaac A. Smith on "Rapid Railway Embankment Construction," being an account of the construction of an embankment in North St. Louis containing 97,500 cubic yards, within a period of sixteen days. The material was river silt and the cost 18.58 cents per cubic yard—but little more than half of the lowest bid received from contractors, none of whom would give a time guarantee. Messrs. Bryan and Wheeler took part in the discussion, in which it was shown that the skrinkage six months after was II per cent.

Professor Engler called attention to an ingenious model of the hyperboloid of revolution.

Papers by Charles H. Ledlie and Professor Charles C. Brown were announced for the next meeting, January 4, 1888

THE CANADIAN SOCIETY OF CIVIL ENGINEERS.

The Canadian Society of Civil Engineers will hold their second general annual meeting January 12, at Montreal, on which occasion the retiring President, T. C. Keefer, Esq., C. M. G., will deliver an address. Half-fare return rates have been granted over the Grand Trunk, Canadian Pacific, and Intercolonial Railways. Full fares will be required to Montreal, and free tickets will be issued for the return journey. Henry T. Bovey is Secretary and Treasurer.

OHIO SOCIETY OF SURVEYORS AND CIVIL ENGINEERS.

THE ninth annual meeting of the Ohio Society of Surveyors and Civil Engineers will be held at Columbus, O., January 10, 11, and 12, 1888. Persons securing a certificate from a ticket agent that they have paid full fare to the meeting can obtain a return ticket at the rate of one cent per mile, provided there is a total attendance of 100.

W. H. Jennings, of Columbus, is President, and Benjamin Thompson, of Urbana, is Secretary. The following are chairmen of committees: On Legislation, E. B. Opdycke, Bryan; On Code, William Reeder, London; On Surveying, J. D. Varney, Cleveland; On Civil Engineering, C. A. Judson, Sandusky; On Drainage, E. D. Shreve, Mansfield; On Highways, D. W. Pampel, Sidney; On Blanks and Instruments, E. D. Haseltine, Haselton. The following papers will be read:

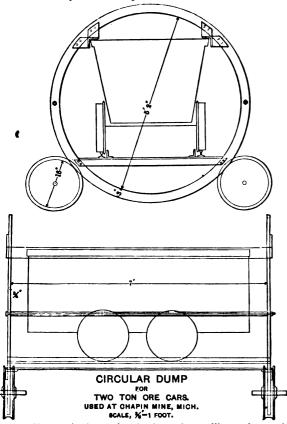

"Judicial Functions of Surveyors," Homer C. White, Warren: "Protection from Incompetency," George R. Gyger, Alliance; "The Public Domain," J. T. Buck, Cardington; "Adverse Possession," E. D. Haseltine, Haselton; "Steel Tapes as Standards." Professor J. B. Johnson, St. Louis, Mo.; "Road Making Materials of the State," Dr. Edward Orton, Columbus; "A State Topographical Survey," J. A. Hanlon, Massillon; "Philosophy of Underdrainage," Jonathan Arnett, London; "Catfish," Frank M. Kennedy, Washington C. H.; "Comparative Cost and Efficiency of Tile Drains and Open Ditches," E. B. Opdycke, Bryan; "Irrigation in Kansas," J. S. Humphrey, Garden City, Kan.; "Two-

Mile Assessment Pikes," E. W. Dimock, Ottawa; "Construction of Turnpikes," G. S. Innis, Columbus; "Notes on Paving," Thomas R. Wickenden, Toledo; "Cleveland City Pavement," M. E. Rawson, Cleveland; "Street Crossings and Sidewalks," R. A. Bryan, Portsmouth; "Street Grades and Monuments," Charles S. Lee, Marysville; "Monumenting," F. Hodgman, Climax, Mich.; "Street Grades and Records," W. H. Jennings, Columbus; "Construction, Maintenance, and Repairs of Short Span Highway Bridges," S. A. Buchannan, Bellefontaine; Computation of Strains in Highway Bridges," C. N. Brown, Columbus; "Bridge Details," H. T. Lewis, Columbus; "Thacher's Slide Rule," H. T. Lewis; "Lifting and Moving of Bridges," Thomas H. Johnson, Columbus; "Pile Foundation," Julian Griggs, Columbus; "Masonry as Applied to Railroad Work," E. G. Pugh, Columbus; "Puzzles for the Engineer," W. A. Guin, Sidney; "Water-Works Construction," J. B. Strawn, Salem; "Circleville Water-Works," W. C. Row, Circleville; "Springfield Water-Works, William Sharon, Springfield; "Mortar," B. F. Bowen, Columbus; "Difficulties of Surveying in the Virginia Military Tracts," William Reeder, London; "Landscape Engineering," John L. Culley, Cleveland; "Duplication of Drawings," Joseph N. Bradford, Columbus; "Railroad Location," S. F. Rock, Mt. Sterling; "Outfit for Railroad Survey," Benjamin Thompson, Urbana, all of Ohio, unless otherwise stated.

REVOLVING DUMP-CAGE.

WE take the following description and illustrations from the Enginee ing and Mining Journal, to which they were furnished by Mr. Per Larssen, the engineer of the Chapin Mine, in Michigan, who had seen the device used in Germany. It is not patented.

"The principle of this dump is readily understood. When the loaded car is standing in the cage, the centre of gravity is a little above the centre of the circle, and it is very easy to start this revolving on the wheels which support it. The load is discharged out of the top of the car, and at once the position of centre of gravity is changed, so that, without stopping, the cage completes its full revolution and stops in its original position. The whole operation is very simple and quick. The car is held in position by the angle-irons running the length of the cage just over the car.

"Among the advantages claimed for the circular dumping-cage is the fact that the cars require no doors, being emptied by turning them bottom up, and they are consequently cheaper to build and more durable."

WEST NEWTON CITY ENGINEER'S REPORT FOR 1886.

The report of the City Engineer of West Newton, Mass., Mr. Alfred F. Noyes, gives the usual record of work accomplished. The recording and indexing of original plans of property in the city has become one of the recognized duties of his office, and its value is become ing more and more recognized.

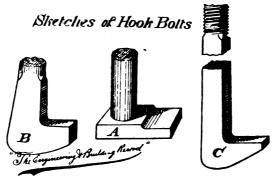

Record is made of a remarkable rain in February last six inches having fallen during the 11th, 12th, and 13th of that month, and in conjunction with a great depth of snow on the ground, which it carried away, caused a freshet of unusual magnitude.

The use of so-called coal-tar concrete (coal-tar and pitch mastic) sidewalks has become quite general, and the question of repair a serious one. Their life, under normal conditions, seems to be from six to ten years, by which time, from the loss of the volatile oils which they contain, together with the action of frost, settlement, roots of trees, etc., the surface becomes rough and unfit for use. The cost of maintenance per yard where no special repairs are made—in other words of entire renewals at stated periods averages for the best work about eight cents per year But if after the surface becomes slightly rough—say in one or two years—a thin coating of sand with tar or pitch be applied at about six cents a yard, or a thicker coat with some fine gravel if left three or four years at a cost of 35 cents, and such repairs be continued as required, the average cost of maintenance, including renewals, will be reduced to about four or five cents per yard. This course is recommended.

His remarks on experience under their new plumbing law are of interest, and we quote from them elsewhere in this issue.

A SIMPLE HOOK-BOLT.

THE turning around in place of round-iron hook-bolts when used to secure railroad ties to track stringers has occasioned great annoyance and much uneasiness as to the security of the floor systems of bridges and viaducts. Different forms of hook-bolts have been proposed to prevent this turning. They are generally expensive to manufacture, and the form of the iron is so changed in the smith shops as to make it doubtful whether it retains its original strength. The Manhattan Railway now use a bolt whose head is represented by sketch "A." The shoulder in the clip-head fits up against the stringer-beam and prevents turning. The head shown by sketch "B"

was designed by a Brooklyn gentleman. It is made square in section and intended to wedge into a round hole and up against the stringer; the square part is not long enough. The Union Elevated Railway Company, of Brooklyn, is using a form of hook-bolt, represented by sketch "C," in which a plain, square bar is turned up at the end without injury to the fibre. The other end is rounded and has a thread cut on it for a nut. This bolt is driven into a round hole of the same diameter as the side of the square, and will not turn under any ordinary provocation. It is possible that this simple bolt may have been used before; if so, we have not seen it. The bolts are, of course, used with the hook end up, and not as shown.

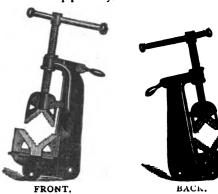

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

OPEN-JAW QUICK-SETTING PIPE-VISE.

THE novel feature about this vise is the rapidity with which the movable jaw can be adjusted for any size of pipe from one-eighth to two inches. This is done by raising the handle on the back of the vise, which opens the

nut through which the screw passes and permits the jaw to be placed at once in the desired position. The handle is then lowered, closing the nut, and a slight turn of the screw holds the pipe firmly.

Quick-setting bench vises are quite common, but we do not remember to have seen the principle applied to any pipe-vise of this pattern, and its utility as a time-saver is obvious.

It is made of steel, weighs ten pounds, and is manufactured by Clarence M. Kemp, of Fayette and Frederick Streets, Baltimore, Md.

Gas and Electricity.

MESSES. BENDER & FRANCKEN have published in Annales Industrielles a new formula for making the conglomerate in Leclanche cells:

Binoxide of Manganese	 40	per cen
Graphite	44	**
Tar	 9	
Sulphur	 0.6	••
Water	 6.4	**

The mixture is reduced to a fine powder and subjected to high pressure in molds. The mass is then heated to about 350° Centigrade (662° Fah.), which evaporates the water and the most volatile portions of the tar. A part of the sulphur combines with the distilled products and the rest unites with the non-volatilized residuum which has an effect analogous to that of vulcanizing rubber.

LIGHTING CARS BY ELECTRICITY.

What may well be called the "burning question" of how to light railway cars lends interest to the following from the Chronique Industrielle of November 6. The passenger trains on the Stuttgart-Halle line are lighted by the Bernstein system of incandescent lights and Khotinsky accumulators. The accumulators are not connected with any electric source, although a dynamo is carried in the baggage-car. On account of this non-connection the lights are not subject to pulsations. The dynamo, during the run, charges a battery of accumulators, which can be used in case any of the batteries supplying the light in any car should lose its force or efficiency, in which case this extra battery could be immediately attached to it. Each car has two batteries of eight accumulators each, and each battery weighs 150 kilograms. The accumulators of each car are separate and entirely independent of the batteries in the other cars. The lamps are fixed to the car ceilings. Third-class cars have threecandle-power lamps. First and second class cars have from five to sixteen candle-power lamps.

ELECTRIC CAR-LIGHTING IN WURTEMBERG.

THE Wurtemberg Government has in practical use on some of its railroads the following system of electric carlighting.

The lights in each car are supplied from separate accumulators which are charged by a dynamo driven from the car-axle. Each car is thus entirely independent, and if the train is stopped or the cars uncoupled the lights are not interfered with. The management of the apparatus is said to be very simple.

THE LEGAL RELATIONS EXISTING BETWEEN WATER COMPANIES AND CONSUMERS.*

BY A. H. DENMAN, ATTORNEY, DES MOINES, IOWA.

[Copyright 1887, by A. H. Denman.]

Company compelled to furnish water to those who apply.—
Water companies as they are generally, in not universally organized, belong to the class of quasi public corporations. They are private companies to whom the State has delegated certain of its powers for the purpose of enabling them to do a public work. The State grants the franchise for the benefit of its citizens, and such companies control therefore, refuse to supply all who were panies cannot, therefore, refuse to supply all who were intended to be benefited by that franchise. A water company stands in some sense in the position of a public officer authorized to administer to a certain public necessity, and is not privileged to make exceptions to the general provisions of the law which gives it its power. It is for such companies to yield their facilities to all who confor such companies to yield their facilities to all who conform to certain conditions and come within the intention of the statute, and for a higher power to determine who shall be the objects of that bounty. It is difficult to conceive of a work which comes more legitimately within the province of the Legislature or of municipalities than that of bringing a supply of water within reach of all or as many as possible of the inhabitants, and of affording facilities in the way of reservoirs water mains etc. of which many as possible of the inflatitants, and of anothing factities in the way of reservoirs, water-mains, etc., of which every one, by complying with reasonable requirements, may avail himself. But it would not probably be heat that the State alone can traffic in water to the exclusion of individuals. If the State should undertake to forbid of individuals. If the State should undertake to forbid any one from buying and selling water except those whom it might permit, or to whom it might give the exclusive right, it would indeed create a monopoly in the plainest sense of the term. But the State has certain powers which are peculiarly her own, and which she can delegate or not, as she sees fit. These things are not the legitimate subjects of private enterprise, and the delegation of these powers by the State to one or more parties to the exclusion of others is not obnoxious, as establishing a monopoly. Therefore, while the State may not, pera monopoly. Therefore, while the State may not, perhaps, forbid traffic in water by private individuals, it lies entirely with her to say whether one or more such persons, to the exclusion of all others, shall use the streets for the laying of water-mains, or condemn private property for the carrying on of their work, or who it shall contract with for the supplying of public buildings, sprinkling streets, etc. So whether or not a water company can be considered as a *quasi* public corporation, and therefore bound to supply all who reasonably apply to it, depends upon the fact of its acting in any sense for the State. To this end it is pertinent to inquire whether the State has upon the fact of its acting in any sense for the State. To this end it is pertinent to inquire whether the State has delegated any of its powers to the company, or given it any exclusive privileges in the use of its streets, etc., or given it the right to condemn private property, or in any other manifested the intention that the company should act for the State in supplying the public pages ities.

act for the State in supplying the public necessities.

In regard to gas companies it has been held that to be a public corporation, and liable as such, the company must have more than a mere license or permission, not exclusive, to lay its mains in the streets, nor would the additional fact that the company is the sole manufacturer of gas in a certain neighborhood, bind it to furnish gas to any or all persons longer than its convenience or caprice might induce it to do so. (1)

Consumers must comply with reasonable requirements.

—If the company is bound to furnish water to all who apply, it follows as a matter of course that it must do so upon reasonable terms. All rules and exactions on the part of the company which tend to deprive one of the privileges contemplated by the incorporation of the company which tend to deprive one of the privileges contemplated by the incorporation of the company which tend to deprive one of the privileges contemplated by the incorporation of the privileges which pany are, as far as they go, violations of the principle which has just been discussed. The company can no more insist upon an unreasonable exaction than it can unreasonable ably and capriciously refuse water to one who applies. The former differs from the latter only in degree and not in kind. On the other hand, the right to draw water from the pipes of a water company is property and is not to be demanded as an unfettered right. (2)

There is a corresponding duty on the part of the consumer to comply with all reasonable conditions—he must make demand on the company for water; he may be required to do so formally by coming in person to the office quired to do so formally by coming in person to the office of the company and there signing a written or printed application, and shall embody the contract between him and the company and bind him to submit to reasonable conditions imposed by the company; he may be required to pay in advance and to make a reasonable deposit to secure the prepayment of the rate for the future; to answer correctly questions concerning the probable number or rooms, size of premises, number of stops, etc.; (3) he must provide himself with proper plumbing and make it safe and free from leaks, (4) or else the company will have the

right to refuse the demand. Many other regulations growing out of the necessities of the case or the peculiar relations subsisting between the parties, will doubtless be upheld by the courts.

Where one makes his own private and suitable connections, he is entitled to receive water through them, and cannot be compelled by the company to take through other fixtures and share the expense in common with other perfixtures and share the expense in common with other persons. Thus, where one occupies apartments in a "model lodging-house," which is a building divided into distinct compartments for each family, and such person has his own separate and appropriate connections for supplying his own needs, the company has no right to insist on supplying the whole building through one system of pipes, and compel such person to take water and share the expense thereof in common with the other occupants of the house, any more than it would compel the occupants of a block of houses to take water in this way. (1).

The company may refuse to supply a person already

The company may refuse to supply a person already indebted to it or who refuses to pay the rate. (2). The contract between the consumer and the company is a personal one, and the occupant of a house cannot be charged with the water-rate defaulted by a former occupant of the same house. (3). So, also, where the tenant defaults his water-rate, and the landlord afterwards moves into the same premises, the company cannot refuse to supply the landlord because of the tenant's default. (4).

landlord because of the tenant's default. (4).

The consumer cannot compel the company to supply him with water as for a family purpose when he has provided his home with the fixtures of a much larger establishment. The fixtures must be adapted to the demands made upon the company. (5). The company may refuse to supply one until he does away with all fixtures except such as belong to the class of consumers among which he intends to be classed. For instance, where one contracts for water for family uses, which the status makes to intends to be classed. For instance, where one contracts for water for family uses, which the statute makes to include movable but not stationary bath-tubs, the company may refuse to turn on the water until the consumer disconnects entirely the inlet-pipes to his stationary tubs, but the company cannot refuse because the consumer will not disconnect his outlet-pipes as well. (6). Where the company is allowed to furnish water for family purposes at another. at one rate and water for all other purposes at another rate, it has a right to insist that the consumer make separate connections and attach a meter so that the company may ascertain how much water is used for other purposes than for the family.

As to whose duty it is to pay for the meter will be considered presently.

Although the company has an undoubted right to cut off the supply of a consumer because of non-payment of the rate where the consumer does not dispute the amount due, yet the company is not thereby made the sole judge of the amount due to itself. If the amount due is in dispute, the company may be enjoined from cutting off the water until the question is adjudicated, and it would seem from this that the courts would refuse to order the water turned on again after it had once been turned off by the company, until after the consumer can show just as conclusively that the claim the company has against him is baseless. (7). Nor can a meter be taken as conclusive of the amount due to the company, although approved, tested by arbitration according to statute, and found to work

In the case of Sickels vs. Manhattan Gas Company (8) an injunction was issued against the company, forbidding it from cutting off the gas from the house of S. On hearing of a motion to dissolve the injunction, testimony was ing of a motion to dissolve the injunction, testimony was that S., on going to Europe with his family, turned off the gas from his meter and pipes by a stop-cock in the cellar and within reach of any one in the house. The servants testified, and there was no direct attempt to impeach their testimony, that the gas continued turned off during the entire absence of S. and his family. But the meter indicated that a considerable quantity had been consumed meanwhile. The meter was admitted to be in good condition, and the company introduced testimony showing the impossibility of the meter's registering anyshowing the impossibility of the meter's registering anything unless gas passed through it. The Court held, however, that the above testimony was sufficient to cast a doubt upon the correctness of the meter, and refused to disturb the injunction until the question as to how much was due from S. to the company was settled by a judge ment at law.

- (1). Young vs. Boston, 104 Mass. 95. The "Model Lodging-ouse" in this case consisted of ten suites of apartments or tenements each one of which contained a sleeping-room, kitchen, and water-closet, and all the conveniences of a common dwelling-h There were no fixtures in the house used in common by the tenants. and no mechanical difficulty in the way of making separate connections or of attaching a meter to ascertain the amount of water used in each apartment. The apartments were not owned by tenants, but the whole building was owned and controlled by a corporation which had general charge of the building and control of the outer doors and halls. An ordinance of the city of Boston also made special provision for such tenements where they had separate water fixtures
- (2). Note 4 Am. & E. Corp. Cases 70. People vs. M. G. Lt. Co. 45 Barb. 136.
 - (3). Sheffield Water Co. vs. Wilkinson, 4 L. R. C. P. D. 410.
- (4). Dayton vs. Quigley 29 N. J. Eq. 77; Dillon Mun. Corp. 320.
- (5). Sheffield Water Co. vs. Carter, 8 Q. B. D. 832.
- (6). Sheffield W. Co. vs. Carter, supra. (7). Sickels vs. Manhattan Gas Co., 64 How. Pr. 334-
- (8). Sickels vs. Manhattan Gas Co., 66 How. Pr. 31.

In harmony with the principle of the case of Sickles vs. Gas Company, it has been held in Maryland that if a consumer owns two houses, and pays the price of the water consumed in one, but disputes his bill as to the other, the company will be enjoined from cutting off the water from the house paid for until the amount of indebtedness in dispute has been adjudicated. (1). It would seem to follow from this that if one owned several houses the company was refuse to furnish water to any of them until the consumer to any of them. may refuse to furnish water to any of them until the con-sumer satisfies his indebtedness as to all, it being admitted that he owed a debt to the company on any one of them. So, also, it would seem that if one became indebted to the company at one place and moved to another, the company may refuse to furnish the water until the first debt is discharged.

Measure of damages for refusal of water and for cutting off the same.—In Gas-Light Co. vs. Colliday, 25 Md., 1, it is held that to unlawfully break the pipe of a consumer connecting with a gas-main is a trespass for which damages are recoverable, and the measure thereof is the deterioration in the value of the premises for sale or rental, and the cost of removing the fixtures and restoring the premises to their former condition. In Shepard vs. Milwaukee Gas Co., 15 Wis., 318, where gas was wrongfully denied to a store, the plaintiff was allowed to recover for the damage done to his business which could be actually traced to this done to his business which could be actually traced to this cause, and also an allowance for the inconvenience and annoyance. The rule cannot be different for water companies, and may be briefly stated to be all the cost of restoring the premises to their former condition and allowance for all other losses in rents, profits, and disturbance of the enjoyment, which are directly traceable to the trespass.

In order, however, to claim damages the consumer must place himself in a right relation to the company, by making suitable connections and tender of the rate. (2.)

Where tender has, however, been once refused the consumer need not repeat the tender every month, or whenever his bill usually falls due. He has a right to presume that the tender is refused until the company notifies him to the contrary.

to the contrary. (3)

Obligation and liability of the water company in case of conflagration.—In the absence of express contract, a water company cannot be held liable in damages for the destruccompany cannot be held liable in damages for the destruc-tion of the premises of a consumer by a fire, which might have been quenched had the water been furnished, even though the company was at fault in not keeping up the supply. (4). Not only so, but the company may alto-gether refuse, in the absence of a contract, to furnish water for extinguishing a fire, although that may have been one of the objects of its incorporation. (5.) If the con-sumer appropriates for that purpose the water of the com-pany, which he has at hand, it is doubtful if the company could recover its value. If the company contracts to keep up a supply of water in the pipes at a certain pressure, with a view to quenching fires, it would, probably, under a familiar rule of the law of damages, be held liable at the suit of the other contracting party, who has been damaged, for all injury which could be clearly traced to the failure of the company to keep up the supply of water, according to its contract. to its contract.

to its contract.

When a municipality establishes reservoirs, hydrants, etc., of its own to provide against the spread of conflagration, it is not liable if the means provided are inadequate to the demand, which may be made upon them. (6.) The responsibility of a city for the precautions which it takes, to prevent public calamities, is political and not legal. No amount of neglect, on the part of the city, to avert these things will render the city liable. Where a city suffers its hydrants, reservoirs, and mains, built as a precaution against a conflagration, to fall into such a state of neglect and decay as to be useless, no action at law will lie for the damages caused by a fire which raged unchecked in consequence. (7). Such cases are very different from the case of damage caused by defective sidewalks, or the bursting of a carelessly constructed reservoir, which would give rise of damage caused by defective sidewalks, or the bursting of a carelessly constructed reservoir, which would give rise to actions of tort against the city. The fact that a private water company is under contract with the city to furnish water for the extinguishing of fires gives the private consumer no more hold upon the company. In such case the company is not liable to the consumer, because there is no privity of contract, nor the city, because the city has suffered no damage. The company can be held responsible only under its contract or to answer to the statutory penalty, if there is one, for failure to keep up the requisite pressure and supply of water in the pipes. (8).

Apportionment of charges for water furnished by companies or by the city.—There is no distinction in the law regarding charges for water between those made by private companies and those made by the city. As far as the private consumer is concerned both stand in the same relation. The power to collect charges for water consumed is a necessary incident of the power to furnish the water. The Legisiature has the same power to regulate the charges of a water company as it has to regulate those of any other public corporation. In California, however, when the former constitution required all corporations not municipal to be formed under general laws, it was held that the fixing of the rates of a water company was a franchise, and not being a general law applicable to all corporations, was void under the constitutional provision. (1.) The law regulating charges for water turns upon the law of sales. The courts all proceed consistently with the proposition that the water is a commodity which is bought and sold. It is the law of personal property and not of realty which applies. Water rents are not taxes, although the statute may in some cases give them some of the incidents of taxes, as, for instance, by making them a lieu upon the premises and enforcing collection as the collection of taxes is enforced. (2.) We have already seen that the contract of the consumer is a purely personal one except as the statute makes exceptions. Water-rates being a charge for value received, the charge cannot be made until the company is prepared to furnish the water (3), and where the supply is not so good nor so abundant as the company's contract calls for, the company may, nevertheless, recover a quantum meruit for what it has actually delivered. (4.) Back water-rents may also be collected as for value had and received. (5.)

The Courts will sustain any reasonable charge based upon any fair method of estimating the quantity of water used by the consumer, but where no water is had, no charge can be made. Hence, a town cannot impose a tax for water upon persons inhabiting premises not supplied with water-fixtures, and who do not take the water the town has to offer. (6.) Nor can a water rate be assessed against vacant lots (7), nor can a building, the lower part of which is used as a store, be charged as an occupied house, or as a place where people are living and presumably requiring more water, (8), nor can a house used as a lodging-house merely be charged for water as a hotel, more especially when the water does not rise therein further than the first floor (9), all of which is upon the sup position that the rate paid is for a commodity and not for a mere privilege, nor for the use or rent of something, nor as a tax. The above instances are, of course, to be carefully distinguished from general taxes levied to pay for water used by the city itself, and from assessments against property for the laying of water-mains, etc., in streets and highways

property for the laying of water-mains, etc., in streets and highways.

Discriminations in charges for water.—Aside from meters (which we shall consider presently by themselves), and other means of actually measuring the quantity of water consumed, various ways of estimating the probable quantity of water used are recognized and upheld by the Courts, and are in common use everywhere. The chafge for water may be based upon the use to which the premises are put, upon the number and size of rooms, number of persons occupying the premises, the number and size of the taps, area of the grounds, and other considerations which really tend to affect the quantity of water used. The different uses to which the water may be put upon the same premises may also be made a basis of discrimination. One may, for instance, be charged so much for the use of water for his domestic purposes and another rate for hose, garden, stable, or stationary-bath purposes. Where such discriminations are used, the charges must be consistent—domestic uses cannot be assessed, as something else which cannot be so included in the fair acceptance of the term.

Domestic Purposes.—Inasmuch as the quantity of water used for domestic purposes is seldom accurately gauged, but based upon a rough estimate, and as this distinction from all other uses is so universal, it becomes important to determine just what such uses include. Domestic purposes include cooking, drinking, washing of clothes, persons and premises of a family—in short, water as applied to the usual and ordinary conduct of family lite. (10.) Hose and the use of water for gardens are usually excepted by statutes, ordinances or rules regulating the charge from domestic uses, and would not probably, in any event, be construed to be such, nor can one, as we have already seen, draw a supply of water for family uses when he insists on maintaining fixtures calculated for the use of a larger establishment. The inhabitants of a work house or penitentiary are to be supplied as a large family, for although the purpose of such a building is public, the water supplied for the life and comfort of the inhabitants

thereof is supplied for a family purpose. (1.) Not so, however, with a city-hall or court-house. (2.) While purposes connected with personal cleanliness are clearly included in domestic uses, this does not include stationary baths in a private house. (3.) This would seem to include stationary wash-tubs as well, although one who pays the charge for domestic purposes is thereby clearly entitled to all the water necessary for the washing of persons and clothing in other than stationary tubs. Where one is supplied with stationary tubs, but removes his inlet-pipes, the company can then no longer refuse him, although he removes neither the tub nor the outlet pipe. (4.) Stationary tubs are extra domestic more because of the facilities they give for the drawing of water than for their character of bath or wash-tubs. A private stable in which there were no water-fixtures has been held to be included in a charge for domestic purposes. (5.)

in a charge for domestic purposes. (5.)

In England it is common to assess the amount of water used by families according to the income of the premises. The charge may be assessed proportionately according to the rent the premises command, or according to the rate at which the premises are assessed for taxes, or upon the actual amount or annual value upon which the assessment to the poor's rate is computed in the parish or district. When the rate is based upon the "annual" this does not mean the same as the "annual value" of the premises. (6.) The annual rent is to be determined by deducting the taxes or rates which the landlord pays to the Government from the gross rent. When the houses are rented by the week and the wa'er-rent is assessed upon the annual rental, an estimated sum must also be deducted from the gross rent, sometimes called the "annual value," to allow for times when the premises stood idle, but the landlord or whoever pays for the water is not entitled to an allowance for repairs or for insurance. (7.) Value and "net value" are held to mean the same thing. "Gross value" is not value at all, but simply an incorrect expression like "gross profits." (8) Where the charge for water is based upon the "actual amount of rent," the company is entitled to assess the water-rate upon a percentage of the net rent which comes to the landlord free of taxes and all expenses usual to keep the premises in a state to command such rent. (6.)

Meters.—There can be no doubt that a water company or board, acting under general powers, has a right to assess the quantity of water used, at so much a gallon or one hundred gallons by actual measurement, and they have power to adopt any suitable means of measuring the quantity of water consumed, whether by meter or any other automatic arrangement that they see fit to adopt. In the case of Young against Boston, 1 Allen, 361, a hotel which had been paying an estimated rate was metered, and found to consume ten thousand gallons of water per day, for which the court held that it must pay a rate of two cents per one hundred gallons as assessed, although the aggregate was four times the amount paid for the hotel under the former arrangement, and but very few of the hotels in Boston were metered. But it is very doubtful, in the absence of statutory provisions, whether the company can compel a consumer to put in a meter at his own expense, or compel him to pay a meter-rent. In sheffield Water Company vs. Carter, 8 Q. B. D. 832, it was decided that the power to compel a consumer to rent or to purchese his own meter, could not be implied from a clause in a statute permitting the company to let meters for hire, nor could the company, which was empowered to lay water-pipes and "other apparatus," put in the meter and charge it up as a part of the "other apparatus."

In New Jersey it has also been held that while a water board acting under general powers have an undoubted right to assess a consumer according to meter, the board has no right to make him pay for the meter, nor for the rent thereof. (10). In Sheffield Water Company vs. Bingham, 52 L. J. Ch. D. 624, the question came up in this form: Who must measure the water consumed, the company or the consumer? It was there decided that the sale of water, as usually carried on, differed from usual sales of merchandise, in that the goods were not delivered to the consumer as he called for them, but it was put in his power to draw what he needed without the knowledge of the seller. Hence, it beig solely in the power of the consumer to know how much water he takes, he is the one who is bound to know and to measure what that quantity is and to account for it to the company. Although it was held that the company might not have the power to prescribe any particular form of meter or measure which the consumer must use, yet the consumer is bound

to provide himself with some automatic arrangement which will accurately measure the quantity of water that he takes from the pipes. In this case, the defendant, who paid extra for a stationary bath-tub, determined by actual hand measure the amount required for a bath He then drew a line around his tub to indicate how far that quantity of water would rise therein. The family were forbidden to fill the tub above the line and were ordered to mark upon a calendar suspended in the bath-room each time the bath was used. This arrangement the court found to be neither adequate nor just to the company, and that the defendant must use some automatic means which would accurately register the amount of water used and not to put the company at the mercy of the forgetfulness or the deceit of any one who might form part of the consumer's household. The reader can hardly regard the above cases as settling very satisfactorily the question who shall pay for the meter. The rule, if any, fairly to be deducted from the weight of authority above discussed, would seem to be, that the party desiring to measure the water must furnish his own means to do so, whether he be the consumer or the purveyor. The question, Lowever, can hardly be regarded as settled. As the population becomes more dense these relations will become better defined. The practical difficulty with water companies furnishing meters to their small consumers lies in the fact of the useful cheapness of the water and the expensiveness of the meter. And yet the enormous waste caused by large numbers of small consumers is often a very serious matter and very hard to regulate; indeed, as the matter now stands, it is to a degree impossible for the purveyor to enforce the care and responsibility he has a right to demand from the consumer. This would be almost wholly obviated by the use of meters. Then in that case, if the consumer neg-lected his plumbing or his faucets, appropriated the water to uses he is not charged with, or allowed his neighbors, who are not consumers, to steal from his pipes, his own wrongs would come upon his own head. It would seem to be but reasonable that as the consumer is compelled to make suitable connections adapted to his demand upon the company, that some form of automatic measure should be included as a part of the necessary plumbing arrangements of the house. The company, it would seem, ought not to be compelled to furnish such fixtures to the innumerable connections which are made with their mains, or else be be left to so large an extent at the mercy of the fraud, deceit, and neglect of tenants. The company ought not to be compelled to furnish the meters any more than

many other items of plumbing it has a right to demand that the consumer shall be supplied with.

If the consumer is not satisfied with the charge made against him as being in excess of the legal rate, there is some intimation in Young vs. Boston, supra, that he may ascertain the true amount due from him by meter and tender the proper charge according to the water actually consumed. There seems to be nothing to prevent the consumer's attaching his own meter or other approved means of ascertaining what he actually takes, and making tender in accordance therewith. This, however, does not apply to one already under contract with the company or city, and who has agreed to pay for what he has a right to take. He cannot then come and compel the company to accept the smaller rate because he did not use enough to justify the amount he has agreed to pay. But it would seem reasoning from principles already laid down by the courts, that the company cannot compel a person to enter into a contract compelling him to pay for more water than he intends to use, and that the consumer is justified in tendering a sum which shall be a fair charge for what he actually takes, and shall tully compensate the company for all the labor and expense of supplying h m. The company have, as we have seen, an undoubted and an unqualified right to attach its own meters and insist in apportioning the charge at so much per cubic foot, barrel or one hundred gallons, or any other suitable unit of measure it chooses to adopt. The courts have not gone very far in deciding these questions. Farther unfolding and application of the law to these matters may be confidently expected from different sources in the near future as the need increases that these relations be more strictly defined.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

THE thirty-fifth annual meeting of the society will be held in New York, on Wednesday, January 18, 1888, at 10 o'clock.

The annual reports will be presented, officers for the ensuing year elected, time and place for the next annual convention considered, reports of standing committees presented, proposed amendments to Constitution and By-I.aws discussed, and other business transacted.

It is expected that the business of the meeting will be transacted during the first day; a lunch will be served at the Society House. Arrangements for the evening of Wednesday, January 18, and for the day and evening of Thursday, January 19, will be perfected by a committee, and will include visits to points of interest, and a dinner or social reception.

or social reception.

The following persons have been selected as candidates for officers by the Nominating Committee: For President, Thomas C. Keefer: for Vice-Presidents, J. James R. Croes, Robert Moore; for Secretary and Librarian, John Bogart: for Treasurer, George S. Gieene, Jr.; for Directors, Mendes Cohen, Joseph M. Wilson, Stevenson Towle, Charles B. Brush, Alphonse Fteley.

HOT-WATER HEATING AND FITTING. BY "THERMUS.

No. XIII.

(Continued from page 465.)

EXPERIMENTS ON THE VALUES OF HEATING-SURFACE, ETC.

To go further with this subject, I will refer to experiments of Mr. Hood made more recently than Mr. Tredgold's, as he was not satisfied with the latter's deductions and made experiments for himself. In his work on "Warming and Ventilation" he tells us that "to ascertain the velocity of cooling for a surface of cast iron, a pipe 30 inches long and 21/2 inches internal diameter and three inches diameter externally was used. The ends of the pipe were closed by corks, which entered the pipe 11/2 inches at each end, and the bulb of the thermometer was inserted into the water about three inches from one end. The exposed surface of the pipe (including the surface exposed by the thickness of the metal at the ends) was 287.177 square inches. The quantity of water contained in it was 132.534 cubic inches, and the equivalent to be added to this for the specific heat of the pipe was 39.341 cubic inches, making the estimated quantity of water 171 875 cubic inches." The temperature of the room in which the observations were conducted was 67' Fah.

This pipe was presumably used on its side in the horizontal position (though this is not stated), and represented no doubt a section of an ordinary 3-inch cast-iron heating pipe used at that time for green-house heating, etc.

He informs us the rates of cooling were tried with different states of the surface: First, when in the usual state of cast-iron pipes covered with protoxide of iron (fine rust); second, black varnished; and third, with the varnish removed and two costs of white lead paint substituted. He observed that the rusty surface cooled from 152° to 150° Fah., or 2 degrees, in 2 5 minutes, and that it cooled from 152° to 140° Fah., or 12 degrees, in 15 minutes. This is at the rate of the whole quantity of water or its equivalent cooling one degree in 1.25 minutes.

He took observations every two degrees fall of the thermometer, which give slightly varying results as to the rate of cooling, but this may be due to errors in reading the scales or in errors in the thermometer, and a close study of the table of his experiments go to confirm the belief that for all practical purposes the rate of cooling is directly as the difference of temperature between pipe or plate surface and the surrounding air.

With the black surface of the pipe black varnished he found that to cool from 152° to 150° Fah. (2 degrees) it took 2 266 minutes, and that to cool from 152° to 140° Fah. (12 degrees) it took 14.533 minutes; or, in other words, cooled an average of one degree in 1.21 minutes, showing an apparent increase of cooling as the difference between surface and air became less. If we take the average of six experiments (1.2: minutes) progressing by two degrees and correct the time observed on cooling the first two degrees by it, we have 2.42 minutes instead of 2.266 minutes. This shows that the black-varnished surface is slightly more efficient than the rusty one-a little over three per cent.*

With the pipe with two coats of white-lead paint, the efficiency was less than with either of the others, but not as great as usually considered.

The cylinder cooled from 152° to 150° Fah. (2 degrees) in (observed time) 2.316 minutes, and it cooled to 140° Fah., or 12 degrees in 15.366 minutes; or, in other words, it cooled I degree in 1.28 minutes average

Mr. Hood's summary of the matter is that 100 feet of varnished pipe, 1031/4 feet of plain pipe, and 1053/4 feet of white painted pipe have the same values as heating surface. He does not, however, give as the values of these surfaces in heat-units per square foot per degree difference no more than Mr. Tredgold does, and as this will be very important to us hereafter when we desire to

ascertain the quantity of water that must pass through a heater in a given time, to maintain some constant temperature, we will have to calculate it for ourselves by the same method of reasoning, etc., as we did in the case of the latter's experiments.

The surface of the experimental piece of pipe is given as 287.177 square inches, which is two square teet lacking less than one square inch, and therefore we will call it two square feet. The quantity of water actually contained in it was 132.534 cubic inches, and the equivalent in cubic inches of water that was to be added for the specific heat of the iron of the pipe, 39.341 cubic inches; making the estimated value of the water and its envelope equal to 171.875 inches of water.

This water was cooled from 152° to 140° Fah. in each experiment, and therefore had a mean temperature of 146° Fah. The weight of a cubic inch of water at this temperature is 248 grains; therefore we have

$$\frac{171.875 \text{ cub. in.} \times 248 \text{ grs.}}{7,000 \text{ grs.} (1 \text{ lb.})} = 6.089 \text{ lbs. of water.}$$

This water was cooled 12 degrees in the various times, which gives us 6.089 × 12 - 73.068 heat-units as the total heat given off in each case from two square feet of heating surface, or 36.534 heat-units per square foot.

The air of the room was 67° Fah.; consequently the difference of temperature, or, in other words, the excess of temperature of the surface over the air, was 89 degrees. The time for cooling the rusty cylinder was 15 minutes, for one quarter of an hour; therefore we have:

$$\frac{36.534 \times 4}{89^{\circ} \text{ Fah.}}$$
 — 1.642 heat-units

per square foot per hour per degree difference. For the varnished surface it is 1.589 heat-units, and for the white painted surface 1.552 heat-units.

COOLING EFFECT OF WINDOWS.

To ascertain the effect of glass windows to cool the air of a room Mr Hood made experiments with a glass vessel as nearly as possible of the same thickness as ordinary window-glass. The temperature of the room was 65 Fah., and the surface of the vessel was 31,206 square inches, and it contained 9.794 cubic inches of water, including the equivalent for the specific heat of glass. He does not tell us the form of the vessel, which would be very important to know, but presumably it was flat, or at least had perpendicular sides, and being small, represented an average effect in cooling. so that the deductions obtained are presumably fully equal to average conditions.

The average rate of cooling from 150° to 110° Fah. was found to be 1.176 degrees when the mean excess of temperature of surface was 65° Fah. above the temperature of the air, and the time 34 minutes.

The total quantity of water, or its equivalent, is found to weigh .3484 lb. at a temperature of 130° (its mean temperature). This cooled 40° Fah. = 13.93 heat-units for 34.296 square inches, or 58.48 heat-units for a square foot for 34 minutes, or 103.2 heat-units for an hour; /civided by the mean difference in temperature $=\frac{103.2}{6\pi^{\circ}}$

1.59 heat-units per square foot per hour per degree difference of temperature.

Mr. Hood's deductions from his experiment is to the effect, that each square foot of window-glass will cool in a minute of time 1.279 cubic feet of air as many degrees as the inside air is warmer than the external in a comparatively still atmosphere, but that when windows are exposed to the action of winds further experiments are necessary.

It is evident the cooling of air through glass, etc., depends on both the velocity of the air inside and outside taken together.

Nearly all the heat that is lost by air of rooms to cooler air through glass is lost by convection. The air inside the glass falls by loss of heat and increase of weight and follows the laws of a falling body. The velocity of air outside is due to wind-pressure and the angle at which it strikes the glass. Quadrupling the velocity of the outer air, however, does not quadruple the loss of heat through the glass, for the reason that the air inside will not fall in the same ratio but in a ratio about as the square root of the increase of outside velocity, so that the loss of heat through glass cannot be accurately established for a given difference of temperature and a certain velocity of the wind outside; an approximation, however, can be made to the loss of heat for other velocities and temperatures. Unfortunately, we have no very accurate data on the cooling effect of windows for the guidance of heating-engineers, though on the

warming effect of radiator surfaces there is not such a scarcity of information.

As these articles are on warming by hot water. I would like to be able to give some data on the values of hot-water surfaces used in common practice. Presumably, on account of the difficulty of measuring the loss of heat from hotwater coils, etc., maintained at some nearly constant temperature as in actual use, few attempts have been made and none made public except some of the writer's, and these were with indirect coils that do not properly represent the value of direct radiation. I hope, before the present winter is out, however, to be able to give some data on this question, and for the present will give an experiment with a common box-coil that approaches more nearly the condition of a radiator set for direct radiation than any thing

While making experiment on indirect coils I boxed one at the sides and ends and left the top and bottom open, so the air ascended vertically. Presumably, slightly better results would be obtained if the heater was open at the sides as well as top and bottom, but of this there is some doubt.

The coil was of one-inch pipe, 6 pipes wide, 10 pipes high, and 36 inches long between bends: the total surface of pipes, bends, and headers being 74 square feet. A difference of about 110 degrees was maintained between the air of the room and surface of the pipes during the time of trial. By measuring the increase of temperature of the air and its quantity, etc., after passing the coil the amount of heat found corresponded to 1.343 heat-units per square foot of surface per hour given off for each one degree Fah. the air was warmer than the coil. The coilbox was then closed in at the top until the outlet for air was 12x16 inches, without apparently diminishing the flow of air, the better to use the anemometer, and the result obtained was practically the same. This agrees quite nearly with the results of Mr. Hood as given for the 3-inch horizontal pipe; though on account of there being 10 pipes, one above the other, in the box-coil, it would appear that it should do less work It may be that the currents of air were accelerated sufficient by the boxing to account for the similarity. Or, it may be, an error existed in the use of the anemometer and that it recorded more air than actually passed, which is possible by taking the centre of the current; the rubbing sides of the box and pipe causing a slower velocity there than was measured where the anemometer could be used. It is not safe, however, to give a box-coil 10 pipes high, used for direct radiation, a higher value than 1.343, and presumably 1.25 heat-units is high enough.

Mr. George H. Barrus, of Boston, in experiments with a Walworth vertical wrought-iron pipe radiator for steam. found that under average conditions of use, with 8 pounds of steam, in an atmosphere of about 51° Fah, that the units of heat given off per actual square foot of surface was 394.4. If we assume the surface of the iron to be 235° Fah.—the temperature of the steam—we have 235° - 51°

- 184° difference. Then $\frac{394.4}{184°}$ = 2.143 H. U. This is considerably less than Mr. Tredgold's experi-

ments give for a short vertical cylinder, but it is what would be expected, as the pipes used were thirty inches long, and in a cluster two inches wide, screwed into a

He also experimented with a Nason radiator of ordinary height, two pipes wide by 24 pipes long. The total number of heat-units per square foot of surface given off was 347.6; the pressure of the steam was 8 pounds, and the temperature of the air of the room 64° Fah. Assuming the temperature of the pipe to surface to be 235° Fah., the difference then between air and heating surface is 170° Fah., which gives us 347.6 H. U. -2.045 heat-

units per hour per square foot per degree difference.

Mr. Barrus' method of measuring the heat was 10 receive the water of condensation carefully and to ascertain its weight, then compute the heat according to the latent heat of steam. The nearness of the results thus obtained by vertical radiators of different makes, and at different times in different buildings, by the same methods, adds value to the data and establishes the fact, when taken with other investigations, that a tube of a vertical radiator will give off heat equalto about two heat-units per square foot per hour per degree difference.

An experiment made by the writer in 1884 on a 2x7 Bundy steam-radiator, for his own information, and before the Bundy patterns were altered to have an actual surface equal to their commercial rating, gave the following

Digitized by GOOGLE

^{*}In comparing these statements with Mr. Hood's table, note that the time here is given in minutes and decimals of a minute, while in the table it is given in minutes and seconds.

results · Actual surface, 38 square feet; water condensed for one hour was 12.843 pounds; when the pressure of steam was maintained between I and 11/2 pounds, temperature of air of room at floor commencement of experiment 52°; at 5 feet high on side wall 58°; temperature of air of room at floor at end of experiment 571/2°; and at 5 feet high 64°. The temperature of the air as it was found at the floor was presumably the temperature at which it first came in contact with the heater, but, as in the other cases, the temperature of the room only was noted-without informing us further-we will in this case take the mean of the temperature given, which is 57.9° Fah., and presumably near enough for our purpose, which is not to compare the heaters, but to establish the condensation or cooling for ordinary condition of use.

Taking the temperature of the steam (1 lb.), therefore, at 215° Fah., and the latent heat of its vaporization at 962 heat-units per pound, we will have : difference of temperature between steam (or pipe), 157.1° Fah., and total heat of 12.843 pounds of steam, 12355 heat-units, or 325.1, heat-units per actual square foot of surface, equaling 2.07 heat-units per square foot of surface per hour per degree of difference between steam and air.

It is possible that should these radiators be transposed as to the buildings they were tested in, the results would slightly differ, as the effect of the passage of heat by radiation alone from or to the radiator cannot be estimated, as it will depend on the surrounding walls, etc. For instance, one experiment being made in a cellar and enother on an upper floor of a building it is reasonand another on an upper floor of a building, it is reasonable to assume it will effect the results, and the question of humidity may also come in as a factor for or against a radiator.

(TO BE CONTINUED.)

PLUMBING LAW EXPERIENCE AT WEST NEWTON, MASS.

CITY ENGINEER ALFRED F. NOYES makes the "follow ing comments based upon his experience under the new plumbing law of that city.

The City Engineer being the agent of the Board of Health for the inspection of plumbing, his assistants were detailed as inspectors.

"The past year's experience has demonstrated that the more time they have been able to give to conversation with plumbers and owners in explanation of the rules, the more ready has been the compliance with the requests of the board. It has also been demonstrated that in order to get the best results, and more perfect work, every step in its execution should be more closely watched

in its execution should be more closely watc'ed.

"As sta'ed in my last report, the board, through the City Council, petitioned the General Court for authority to require all plumbers doing work in this city to be licensed, and March 20, 1886, the General Court passed chapter 100 of the Acts of 1886 granting the desired authority. An ordinance has been drafted in accordance with this act and is now under consideration by the board. That the ordinance is needed is shown by the large amount of careless work found to have been done, in one case the careless work found to have been done, in one case the careless work found to have been done, in one case the entire plumbing for a bath-room having been done personally by a tenant who was not a plumber. Such an ordinance will not only place the plumbers directly in contact with the board, but will also relieve the plumbers of the pressure to which they are frequently subjected by the results are interimperant of their own realizes or owners that are either ignorant of their own welfare or

desirous of saving expense.

"The inspection of new work this year has shown that more care is needed in several particulars. There is a tendency to leave the top end of the soil-pipe near windows in the roof or other parts of the house so that odors rising through the pipes are blown into the house. In some houses small S-traps are used for bath tubs, bowls, sinks, or wash-tubs. These traps are the same size as the waste-pipes, and as soon as they collect any grease the diameter begins to diminish, the sectional area of the trap becomes less than that of the waste pipe, and the trap becomes especially sensitive to either suction or force. In the case of one of these traps attached to a bowl on the second floor it was found that the wind blowing across the top of the soil-pipe suphoned the trap and allowed the the top of the soil-pipe syphoned the trap and allowed the odor from the soil-pipe to escape into the room. As the bowl was in a sleeping-room, and within three feet of the head of the bed, the danger is apparent to any one. In another case a trap of this kind was found attached to a nother case a trap of this kind was found attached to a nother case a trap being only three. kitchen sink, the diameter of the trap being only threequarters of an inch.

quarters of an incn.

"In the cheaper grade of houses, where the only fixture is a sink, it has been quite common in the past to use either a lead S-trap or to place a large six-inch earthen trap outside of the house in the main drain. During the trap outside of the house in the main drain. During the past year an endeavor has been made to improve this plan. The small S-trap is entirely unfitted for a kitchen sink on account of the large amount of grease which has to pass through it; the large earthen trap is so much larger than the waste-pipe from the sink that it is liable to stoppage not only by the collection of grease, but by reason of the insufficient scouring it gets. This trap is usually beried up in such a way that it cannot be readily opened and cleaned. The trap recommended is the lead drum or round trap; under all ordinary circumstances this trap is practically antisyphoning. It it generally set upon the floor under the sink, has a brass screw-cover, can be readily opened and

the grease removed as often as may be necessary. It has also been common in the cheaper grade of houses to construct a wash-vault, so called. By this arrangement a vault is built having a pipe leading out from the bottom to a cesspool: the waste-pipe fram the kitchen sink runs into the vault, and is supposed to wash out all the deposit It is a primitive water-closet, but the flow of water from the sink rarely comes while the deposit is in a condition to be readily removed: the force of the water is rarely sufficient, and the general result is a combination of sink-water and fæcal matter, which is much more offensive than either alone. The dry vault, well cared for, and into which sink-water is not allowed to enter, is much less offensive and is no more expensive.
"More care should be used in running vent-pipes from

traps. These pipes should be so arranged as to have a constant upward direction. In connecting traps with the main vent-pipe, it has been necessary in some cases to un the vent-pipe up and then down into the main vent run the vent-pipe up and then down into the main vent, in order to avoid cutting partitions, beams, or floors: it can readily be seen that although this arrangement may not destroy the ventilation entirely, yet it is a defect, and the downward turn prevents the perfect action of the pipe. In all cases of this kind care must be used to prevent any sags which may become traps by reason of condensation sags which may become traps by reason of condensation or other causes. All vent and soil p pes should be run as near as possible to warm chimneys or the inside walls of the house in order to secure, by reason of the warmth of the pipes, a constant upward tendency of the air within the pipes, a constant upward tendency of the air within them. When gas or screw pipe is used for ventilation-pipes, extra care should be taken that all joints are made tight. Where branches or vent-pipes are left for future fixtures, care must be taken to see that the ends are properly plugged. In one case this year a 2-inch vent-pipe was left open at the head of the cellar stairs in a position from which the gas could readily escape into all parts of the house.

During the year numerous examinations have been made of private houses at the request of either the owner or the tenant. Owing to the prevailing method of running all pipes inside of partitions or beneath floors which are securely nailed down, it is often quite difficult, and sometimes impossible, to make satisfactory examinations. sometimes impossible, to make satisfactory examinations.

Ali pipes should be run in positions where they can be readily exposed to view, and in no case enclosed in plastered partitions. This suggestion I consider of value not only from the sanitary point of view, but also on account of the economy in making repairs. All spaces enclosing soil, waste or vent pipes should be ventilated.

The principal source of trouble in old houses has arisen the continued use of the pan water closests which he

from the continued use of the pan water-closets which be-come foul in the receiver and defy cleaning except by taking them entirely apart. This style of closet is being largely replaced by the various patterns of hopper closets, which are usually provided with a copious flush of water and can be readily kept clean. A source of bad odor is the lint and dust which collects under a water-closet back of the front board. In pan closets there is often a leakage of the valves, and in hopper closets a slight condensation which runs down on the floor and keeps this lint and dust damp, and finally produces a bad odor. If water-closets were finished without front boards this defect would not occur, and any leakage would be immediately discovered. In the old style of water-closets the urine shield is often of wood or lead the wood becomes saturated and the lead is seldom washed so that the action of the urine upon either the wood or the lead is extremely offensive; enameled iron shields are now generally used, and they are not open to the above objections. The crockery and the shield of every watercloset should be frequently washed, and should be at all times kept clean and sweet. Water-closets do not always have sufficient scour of water when used to properly clean them or to remove all deposit.

It was formerly customary to run the waste-pipe from the bath-tub and bowl in the bath-room directly into the trap of the water-closet without any trap for these fixtures except that of the water closet. The result is a liability of fæcal matter to stop up the waste-pipes, and bad odors frequently arise from them. In some instances the waste-pipes have become so stopped from this cause, that water pipes have become so stopped from this cause, that water discharged from the bowl backs up into the bath-tub and then slowly runs off from there. In one case noticed the bath-tub was pitched the wrong way, and when the water from the bowl backed into the tub about one-half inch of dirty water remained at the head of the tub and could not run off. In some cases bath-rooms or water-closets are placed in rooms without windows. They should never be been the property of suplicit and air

placed in rooms without windows. They should never be placed where they cannot have plenty of sunlight and air. "In one building the exhaust-pipe from a steam-engine in the basement was connected with a soil-pipe which did not extend through the roof, the result being that the steam forced every trap in the tenements above, and frequently puffed out in the rooms. In one house that was repaired it was found that there had never been a trap on any fixture in the house and one of the bath rooms in the

any fixture in the house, and one of the bath rooms in the house opened directly into a sleeping apartment.

'After inspecting one residence the following report was sent to the tenant: 'Hopper closet in cellar with was sent to the tenant: Propper close in Cenar with direct supply from the city main, very poor flush or scour; wash tubs in cellar have drum-trap apparently all right; bowl on first floor not known whether trapped or not; kitchen sink on first floor in same condition; waste-pipe from bowl on second floor deposits contents in bath-tub; waste from both tub very slow, apparently stopped; no trap appears upon either bowl or bath-tub; pan water-closet sends out very strong stench when pan is dropped; the crockery and lead urine shield on this closet were extremely dirty, and should be washed; general smell of

bath-room very foul and recommend that windows be kept open; soil-pipe stops at second floor, has no foot-vent, and joints are apparently made of putty; same tank used to supply water-closet on second floor that is used for believing history. boiler in kitchen.

The foregoing cases are samples that are frequently met by the inspectors, and show the necesity which has existed for the rigid enforcement of the rules ordered by I am pleased to say that I think both owners and plumbers are appreciating more and more the necessity of more care in designing sanitary appliances, and that the standard of work has been raised very much during the nest year." ing the past year.'

MASTER PLUMBERS' ASSOCIATION OF BOSTON AND VICINITY.

AT a meeting of the Master Plumbers' Association of Boston, held December 22, the following officers were elected for the ensuing year: President, John H. Stevens; First Vice-President, Isaac Riley; Second Vice-President, Daniel G. Fin: erty; Third Vice-President, Thomas J. Tute; Treasurer, John Crawford; Recording Secretary, William H. Mitchell; Financial Secretary, John W. Cosden; Corresponding Secretary, Frank A. Titus.

THE NEW YORK HEALTH DEPARTMENT SECURING THE PUNISHMENT OF "SKIN" PLUMBERS.

IT affords us pleasure to commend the New York Health Department for its endeavor to secure the punishment of 'skin' builders and plumbers who persistently violate the law. Below we give a list taken from the files of the Health Department a couple of weeks ago of recent arrests and convictions:

William M. Kearney was arrested for defective work at 506 West Forty-fourth Street. Inspector W. E. Partridge reported many open and defective joints in soil and waste pipes, especially in water-closet connections and traps. There were free openings in the soil-pipe at many joints, and in one case the spigot end of a length of pipe did not engage at all with the hub of the next end. Mr. Kearney was fined \$250.

John Kear was arrested November 2 for defective plumbing in two tenement-houses on corner of Tenth Avenue and Fortieth Street, reported by Inspector Partridge. The numerous open joints found in soil-pipes were varied with some joints stuffed with oakum and no lead. Mr. Kear upheld the merit of his work and insisted to Chief Inspector Collins that there was no better in New York City. However, he deemed it expedient to plead guilty to the indictment for violation of the health laws, and, in consideration of the most thorough reconstruction of the work in question, his conviction only cost him a fine of \$50, since the payment of which his recent work has endured the most severe tests and inspection.

John McNamarra, 248 East One Hundred and Fourteenth Street, was arrested November 5 and fined \$100 for plumbing violations in five tenement-houses on One Hundred and Fourteenth Street, east of Madison Avenue. Inspector W. H. Titus found cracked pipes, defective joints, open joints, joints packed with paper instead of oakum, and one instance where mud was used for calking a joint in a fresh-air pipe. Out of a total of 19 joints 14 were calked with paper and one with mud.

James G. Collins was arrested October 5, convicted, and fined \$100 for generally defective work in four houses on Ninety-fifth Street, east of Ninth Avenue, reported by Inspector L. M. Hooper. Sample joints were made by layers, first of oakum, then mortar, and a thin film of lead on top. This work was especially defective where least accessible, on the evident assumption that it could not or would not be inspected in such places.

Christopher Nally, 255 East Forty-ninth Street, was arrested November 19 for defective plumbing in tenement 319 West Forty-fourth Street, where Inspector Partridge found almost innumerable defective joints.

Mr. Nally was tried by Special Sessions December 15, and, although vigorously defended by two lawyers, was convicted and fined \$150.

Ellis & White, 141 East Fifty-ninth Street, were arrested for defective plumbing in four houses at northeast corner of Tenth Avenue and Ninety-third Street, where Inspector H. D. Dickinson found many open joints, nearly all filled with putty to deceive the inspector. They were convicted at the Court of Special Sessions, December 14, and fined \$250 each.

Thomas White, of the above firm, was convicted at the same time on a separate charge of violation of plumbing laws in five houses on north side of Eightieth Street, west of Lexington Avenue.

Inspector J. T. Corcoran found open joints in housedrain and soil-pipe, also split pipe, waste-pipe graded the wrong way, and other violations, for which Mr. White was fined \$250 more.

Both of the last two cases were vigorously defended and occupied one entire day in trial.

F. M. Clemmens was arrested November 7 for "skin" work at 9 East Eighty-fifth Street. Inspector Hooper reported a large number of open and defective joints.

Thomas Flynn, 101 West Sixtieth Street, was arrested November 10 for plumbing violations reported by Inspector Dickinson in Nos. 115 to 151 Ninety-seventh Street. Numerous defective joints and cracked and split pipes were found throughout the different buildings discharging sewer-gas into the apartments.

James G. Collins, who was arrested October 5, and convcted for "skin" plumbing, has since been rearrested for defective plumbing in six houses on north side of Ninetyfourth Street, west of Eighth Avenue. Inspector Dickinson found defective joints, split pipes, open joints, and joints containing no packing whatever-not a trace of either oakum or lead. Some of these pipes were very difficult of access, showing a disposition to do bad work where an inspector could not examine it or would be greatly inconvenienced in penetrating. It chanced that one of the above houses was owned by a prominent physician, who was much astonished and chagrined at these developments, and equally grateful for the efficient investigation and action taken by the Health Department.

John Kelly was arrested for "skin" plumbing in twelve tenement-houses on west side of Eighth Avenue, between One Hundred and Forty-seventh and One Hundred and Forty-eighth Streets. The work was wretchedly done throughout, the examination by Inspector Hooper disclosing 125 open joints; also joints otherwise defective, split hubs, cracked pipes, joints partly calked and others not calked at all. In some instances the house-drain had no fall, and in others it was in the wrong direction, being graded towards the house instead of sewer. Upon his hearing before the Police Justice, Mr. Kelly loudly demanded "trial by jury," which he insisted should be composed of mechanics. This elicited the suggestion that it might appropriately and satisfactorily (to him) be further restricted to contain only "skin plumbers."

THE USE OF KEROSENE OIL IN STEAM-BOILERS.*

BY LEWIS F. LYNE, JERSEY CITY, N. J., M. A.M. SOC. M.E.

THE action of kerosene oil for the prevention of scale in steam boilers is a subject upon which the books appear to be silent. At least the writer has been unable to find to be silent. At least the writer has been unable to hid any practical data, that could be made use of, in determining its value as a scale-destroyer. It has often been recommended, but its application for that purpose, so far, has been quite limited. Many theories in regard to its action inside of steam-boilers, have been indulged by engineers, but no systematic course of treatment has yet been brought to my notice. Therefore, a portion of practical experience is presented herewith, in that line, with the hope that others may be induced to compare notes,

the hope that others may be induced to compare notes, and all parties concerned receive substantial benefit. In consultation with an engineer, for whom I entertain a very high regard, he suggested that I try crude petroleum as it was better than kerosene, but he gave no plausible reason why, nor advice as to the quantity or method of introducing it. There was but one course left for me to pursue, which was to try some experiments.

At the Jersey City Electric Light Company's station we have two sectional boilers of the new Root type, 100 horse-power each, and one of 155 horse power. We use the Passaic water, which makes a great deal of scale, and in the steam space, I have noticed a very marked corrosive action, more especially upon the cast-iron flanges of the safety-valves. Within the shell-boilers, which we formerly used, hard scale was formed to an alarming the safety-valves. Within the shell-boilers, which we formerly used, hard scale was formed to an alarming extent, and we could not get a scraper between the tubes to remove all of it. In the dry season salt water found its way into the reservoir, and I now have large lumps of saline matter which were removed from our boilers.

In the boilers which we are now using hard scale would form so as to more than half fill some of the 4-inch tubes of which our boilers are principally composed. Something had to be done. I had tried several compounds, with more or less degrees of success, but still the interior of our boilers could not be kept clean. We tried blowing off, used scrapers and other devices, but without obtaining permanent relief. The deposit was mostly in the lower row of tubes, and within four feet of the back ends near the mud-drum. . The loss of heat due to this incrustation

Nystrom gives the following for calculating this loss:

 $H = \frac{1}{32 \times t^3}$

In which t equals the thickness of scale in sixteenths of

an inch, and H the per cent. From this it would seem that a scale of one sixteenth would cause a loss of about 15 per cent.; three sixteenths, 23 per cent., and so on. Some have claimed the conductivity of scale to be at least 30 per cent. less than iron, hence we recognize the necessity of keeping boilers free from scale and sediment

30 per cent. less than iron, hence we recognize the necessity of keeping boilers free from scale and sediment.

As a preliminary experiment with kerosene oil, I took a test-tube of 1-inch diameter, and in it placed a lump of scale taken from our boilers. A tablespoonful of water was then added, with a film of kerosene upon its surface. Heat was then applied from a Bunsen burner. When ebullition began, the kerosene separated into globules and followed the sides of the tube to the bottom, thence they arose through the centre to the surface. This action continued as long as heat was applied, and proved conclusively, to my mind, that the kerosene would not remain upon the surface of water in a boiler, as has been argued by some engineers. I have since proved this correct, beyond a doubt, by drawing water impregnated with kerosene from near the bottom of the boiler. From the time the water in the test-tube began to simmer the scale commenced to disintegrate, and continued until nothing was left but the hardest substances.

I concluded from this experiment that kerosene oil was just the thing to use in our boilers, so an apparatus to introduce it was made, and attached to the feedpipe. It is an inexpensive affair, made of a piece of five-inch iron pipe, twelve inches long, with a cap screwed upon each end as shown. A pipe at the bottom connected with the hydrant, while the pipe at the top conveyed the kerosene into the teed pipe when the water was turned on. A tallow cock was screwed into the top for filling while the air and water were drawn off at the stop-cocks shown for that purpose. When the feed-water is taken from a tank, or well, where there is no pressure to force it into the boiler, a globe-valve must be placed in the feed-pipe, so as to compel the water to flow temporarily through the reservoir, in the direction shown temporarily through the reservoir, in the direction shown by the arrows, carrying the oil along with it. Our feedpipes used to clog up with hard lumps of scale and rust from the water, but since we began using kerosene, these pipes are all clean and they do not rust. I therefore recommend that the reservoir be placed so that the kerosene may pass through all the water-pipes if possible. When our apparatus was ready for use the water was blown off from a 100 horse-power boiler, the blow-cock closed, and two quarts of kerosene oil introduced. The injector was then started (by steam from one of the other boilers), and as the water rose, the kerosene reached every part of the interior surface. Before filling this boiler an examina-tion was made which showed scale in the tubes of threesixteenths to one-quarter inch in thickness, while in the headers it was half an inch thick in places. We never put cold water in our bo lers, either to wash or fill them, put cold water in our bo lers, either to wash or fill them, unless they are cold, for I have known cracks to originate in steel boilers by so doing. We put in two quarts of kerosene every other day for one month, when this boiler was blown off at ten pounds pressure. It was then opened and examined when we found that the scale was partly dissolved and loosened so that a scraper removed most of it from the inside of the tubes. The scale in the headers remained quite hard, although the surface was softened by the action of the kerosene. The blox-off cock was then closed, and two quarts of kerosene put in, after which the boiler was filled with water, as described. The object of putting in the kerosene first is to have it penetrate the of putting in the kerosene first is to have it penetrate the or putting in the kerosene first is to have it penetrate the scale and loosen it as the water rises, and we know that it does this. During this second month we used the same quantity of kerosene, and in the same way as the first month. At the expiration of that time the water was blown off, and an examination revealed the tubes perfectly clean there was, however, some scale left in the headers, but it was so soft that it could be easily removed with the finger nails. We used no scraper this time, but just closed it up, put in two quarts of kerosene and filled it as at first. During the third month we blew down two gauges of water every week and used the same quantity of kerosene At the expiration of the third month we blew as before. off the water and opened the boiler when to our satisfaction we found it *clean*, a condition that never before existed since we started the boilers. The dirt had all settled in the mud-drum and when the blow-off cock was opened it passed into the sewer. Not a teaspoonful of sediment was found inside this boiler. I closed this boiler and ran it taree consecutive months without opening the blow-off cock or changing the water during that time, using the same quantity of oil as before. At the end of the three months the water was blown off and no dirt was found in the tubes, and very little soft mud in the mud-drum. This I thought was a very conclusive experiment. We then adopted a rule of one quart of kerosene per day for each of the 100 horse-power boilers, and three pints for the 155 horse-power boiler. The water is blown down two gauges every week and the entire contents every month. Water is never used to wash them out nor is a scraper necessary; for the mud all goes out with the water. An examination is made of the interior and we put them to work again. This is a wonderful relief to us, for the reason that no scale forms in any of our boilers, and the corrosive action mentioned as having existed at first has entirely ceased.

Another thing worthy of special notice is, that it was within two months. Before using kerosene these tubes would become badly grooved and eaten away at the upper ends so that they would break. Our engineer came very near losing his eyesight through the breaking of one of

these glasses, and his face was badly disfigured by being cut with the broken glass. Now these tubes do not show any such action, and they have been in use more than a

I admit that rubber packing and kerosene oil do not 4 agree, so to guard against any trouble from that source, I had new nuts 1½ inches deep placed at the ends of the glass tubes, and used asbestos wicking dipped in boiled oil, and then squeezed dry, for packing. They do not leak and these joints are permanent.

use rubber packing in flange-joints about a boiler, or in any place where it comes in contact with steam. For faced-joints, I insert asbestos in sheets, one sixteenth inch in thickness; and for rough joints, the sixteenth inch in thickness; and for rough joints, the same material one-eighth inch thick. After purchasing the asbestos, I spread upon both sides, with a brush, all the boiled oil that it will readily absorb, and then hang up the sheets until required for use. When a gasket is needed, we cut it to the required size, then rub both sides well with pure graphite, and screw it up hot, after which no more attention is required. We have joints made in this way which have been in use more than there were this way which have been in use more than three years, and as yet have showed no signs of leaking. I took some of them apart recently, and the surfaces separated very nicely, and there was no evidence of rusting or corrosive action upon them. A short time since, one of our neighaction upon them. A short time since, one of our neighbors had great difficulty in making a joint upon a badly rusted mud drum of a shell boiler, and it could not be kept tight for any considerable length of time. He made a gasket of asbestos prepared as described, and has not a gasket of asbestos prepared as described, and has not touched it since. In taking apart our flanged joints, we broke no bolts nor split any nut, as is usual with such joints made in the ordinary way; for, when these joints were made, we smeared the threads and nuts with graphite mixed with boiled oil. A small quantity of this substance rubbed upon the stems of safety-valves will prevent them from sticking or corroding. A small monkey-wrench easily removed the nuts, and none of them were rusted. This is the way we treat all of the nuts and bolts upon our boilers, and the same mixture is used in putting up steamboilers, and the same mixture is used in putting upsteam-pipe. The result is that we break no fittings nor do we split any pipe in taking them down, after years of service. I am aware of instances where graphite used upon iron surfaces has shown, when taken apart, a sort of hard scale, having the appearance of some sort of cement. This is liable to occur when the graphite contains foreign substances, such as silica and sulphur. The common. cheaper forms of graphite will not give satisfaction for these purposes; it must be pure. The kind that I now use, and poses; it must be pure. The kind that I now use, and have used for the past fifteen years, is made by the Dixon Crucible Co., who have a special process, by which they remove all earthy and mineral substances, leaving the flakes of graphite pure. I have never had any unpleasant experiences with this grade of graphite, and have used it experiences with this grade of graphite, and have used it extensively, not only as described above, but also in the cylinders of steam-engines. In conclusion, I desire to say that crude petroleum has, to my certain knowledge, been used in steam-boilers during the past eleven years and upwards, where, with judicious application, it has been successful in removing and preventing scale. While this is admitted, I must also acknowledge that great damited to believe her resulted by not observing the receiver. age to boilers has resulted by not observing the necessary precautions in the quantity put into the boiler each time. I will mention but one instance, which is that of a tug-boat now running in New York Harbor. The boiler was badly scaled, and some one advised the engineer to use crude petroleum; so he "gave the boiler a good dose," as he said. In a few days the tubes began to leak, and the he said. In a few days the tubes began to leak, and the crown-sheet bagged down. The boat was then laid up, when it was found that the heavy oil had mixed with the mud and had formed a paste on the crown-sheet. This paste kept the water from reaching the plates, hence the result stated above. This paste was so dense that water from a hose would not dislodge it; and I do not hesitate to say that, had kerosene oil been used in this instance instead of crude petroleum, the boiler would not have been instead of crude petroleum, the boiler would not have been injured. The reason is that there is not sufficient body in kerosene oil to form a paste. The chief objection to crude petroleum is that it is too heavy, while in kerosene oil there is no substance which will stick fast to the interior of a

In it we find all that is necessary to accomplish the desired object without the objectionable features just mentioned. I appreciate the fact that there may be instances where steam is blown directly into fibrous materials in the course of their manufacture, and also in the preparation of articles of food, where the odor or possibly the taste of kerosene oil might be disagreeable; but such instances are few, when compared with the many, where it might be successfully employed for the prevention of scale in steam-boilers. Some engineers advance very queer theories against the use of kerosene; but I must assert that, for the most part, they are only imaginary. We have as yet found no objections in our experience. Our boilers do not lift their water, they are free from scale, and our fuel bill is thereby greatly reduced.

THE NEW BRIDGE AT CAIRO.

THE new Cairo bridge across the Ohio River is to have two spans 518 feet each, seven 400 feet each, and three 250 feet each; total length, 4,760 feet. It will be 53 feet above high-water mark, and will cost \$2,500,000. It will take 21/2 years to build it.

Abstract of pap r read at the sixteenth annual meeting of the American Society of Mechanical Engineers.

Correspondence.

All correspondents should s-nd us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

"THE OLDEST TIMBER BRIDGE OF ANY CON-SIDERABLE SPAN."

WINFIELD, KAN., December 22, 1887.

WINFIELD, KAN., December 22, 1887.

SIR: I had intended some time since to call your attention, as a matter of historical interest in the progress of bridge-building in America, to the claim of Professor Trowbridge in his article in No. 20, Vol. XVI. (October 15), for the Towne lattice bridge therein referred to as "probably the oldest timber bridge of any considerable span in this or any other country." If the bridge he refers to is still standing the claim may now be good, but two years ago, a bridge then standing in Chillicothe, Ohio, would have been entitled to priority, having been built and opened for travel in 1817 and in continuous use until torn down to be replaced by an iron superstructure. torn down to be replaced by an iron superstructure.

The bridge I refer to was built of oak timber and cov-

ered, and consisted of two spans, each 150 feet in length, with double roadway. The trusses were laminated arches, slightly braced, from which the roadway was suspended by wrought iron rods.

The old masonry piers were in good condition, and after

being pointed up and slightly repaired, received the new superstructure.

Last year I prepared a description of it, which will be found in the "Proceedings of the Ohio Society of Surveyors and Engineers."

Respectfully yours,

CHARLES B. COOK.

ON ARRANGEMENT OF VENT-PIPES FROM A WATER-CLOSET.

BIRMINGHAM, ALA., December 20, 1887.

BIRMINGHAM, ALA., December 20, 1887.

SIR: As I am now fitting up Mayor Lane's new residence, I would like your opinion on the arrangement of my vent-pipe from two of his water closets. I enclose sketch. My soil-pipe is 4-inch, using Y and ½ bends in making all connections and offsets in soil and vents until I get above floor, where I used full-size lead, 2-inch for trap-vents into soil-pipe vent, 1½-inch for other two vents, the receiver, and bowl. All vents run separately to deck on roof. There is no other work over his. The traps, eight pound, with seat, and 4-inch brass ferrule wiped on the lower end of receiver. The vents rom bowl are run to outside wall for current.

Respectfully, W. H. FRANKLIN.

THESE PIPES TO CONVENIENT POINT OUT OF DOORS . GAS JET VENT FROM UNDER SEAT METHOD OF RUNNING VENT PIPES FROM THIS TYPE OF W.C

The vents, which we have labeled A. B. and C. are each for a different purpose. A is the trap-vent to prevent syphonage. Under the conditions stated the size mentioned is ample to serve the purpose. B is the vent from the receiver used on this form of closet to permit the expulsion of air confined between the water in the trap and that in the bowl; to carry this to the nearest convenient point out of doors, where the occasional puff of air will cause no offense, is the proper thing to do in the latitude of Birmingham. C is the vent from under the seat or bowl intended to secure local ventilation - i. e., to ventilate the apartment in which the watercloset is placed. If this vent went directly out of doors without the aid of artificial heat inside the house the draught would often be from out doors into the room and thence into the house. To maintain a constant draught out of the water closet apartment, this pipe should have a gas-burner lit within it, and for that purpose there are several forms of lanterns made to adjust to such a ventpipe]

CAN THE ELEVATED ROADS BE OPERATED WITH LESS NOISE?

NEW YORK, December 12, 1887.

SIR: About two months ago I moved into rooms situated near one of the stations of the Sixth Avenue Elevated Railroad, not realizing what an intolerable noise the trains and locomotives make, and my experience, which must be the same as that of many others, causes me great regret at choosing the situation. The trains passtwo arriving at the same moment—with great frequency; the rumbling noise of the heavy train on the slight iron structure is very loud, and the puff, puff, puff, puff of the locomotive as the train starts out of the station is exceedingly startling and annoying. I notice that the drivers of the locomotives differ in their management of them; some cause them to puff only a few times at the very start, and not at all when the trains are light; other drivers cause the locomotive to puff a distance of 400 to 500 feet without regard to the length or weight of the train behind them. The sudden and violent puff of the steam is very trying just as one has laid down to sleep, and in my own case has an irritating effect on my nerves. I write to inquire whether it is possible for the locomotive drivers to accomplish the work required without making so much noise. I confess having no practical knowledge on the subject.

If nervous irritation and personal discomfort were the only results of these circumstances, one might perhaps get used to them, as my neighbors say I should do; but two physicians who make a specialty of the ear inform me that the continual noise to which my ears are subjected will eventually dull my hearing. As I have no predisposition whatever to deafness, the prospect of becoming so does not please me very highly. One of these aurists says he has patients whose deafness can be traced to the noise of the L roads.

The citizens of New York are long suffering and endure many evils, but is not this a new one and very serious in character? Do not imagine I am opposed to the elevated roads per se, for their importance is incontestable; the question I would raise is: Cannot they be operated with less noise?

One word more of a personal character: I have mentioned "nervous irritation," which may cause you to think me a weak, invalided woman, but, on the contrary, I am a stout, hearty man of forty and odd years, who is not commonly conscious of possessing nerves.

O, that the day may soon come when electricity will move cars on the L roads cheaper than steam! To expect the change sooner is to place too much confidence in a money-making corporation. With President Grant, I cry: "Let us have peace." KNICKERBOCKER.

[We shall comment on this later, and meantime should be glad to hear from our readers on the subject. Dwellers in New York have so hardened themselves to endure the noise of the elevated roads as an unavoidable evil that it is only when some new sufferer complains that we realize that the evil is not less great because it is chronic. There is fame and fortune for the man who can devise an efficient remedy.]

NEW YORK HEALTH BOARD PLUMBING REGULATIONS.

SIR: What is the object of a trap to an overflow-pipe of drinking-water tank, as required by section 45, recently published regulations of the New York Health Board? It is seldom likely to have water in it.

[We do not know. Possibly our health authorities will explain.]

MURIATIC ACID FOR CLEARING WATER-BACKS.

SIR: I do not know whether your readers are aware of the fact, but as I have never seen it in print, I venture to send you a recipe for removing lime from water-backs. Until recently we have used drills, but upon the suggestion of an expert chemist, whose water-back was stopped, we used muriatic acid and have continued to do so ever since, with good results. W. G. N.

MILWAUKEE, WIS.

MUNICIPAL DISPOSAL OF GARBAGE.

WILKESBARRE BOARD OF TRADE. WILKESBARRE, PA., December 21, 1887.

SIR: The question of the safe, prompt, and systematic removal of house garbage increases in importance with the growth of a city. It is beginning to attract some attention here, and I have been requested by a committee appointed to consider it to make such inquiry as I can with regard to

the plans or methods pursued in cities where the matter receives recognition at the hands the municipal government, or touching any scheme, public or private, that has had the approval of experience. I am informed that the subject is one with which the editors of THE ENGINEER-ING AND BUILDING RECORD are more likely than any others to be informed. If it could be treated generally in your columns it would answer our purpose, and, it seems to me, be appreciated by your readers in every direction. Respectfully,

C. BEN JOHNSON, Secretary.

[We shall try and review this matter in a subsequent issue. Meanwhile, should be glad to be advised of any cities that have resorted to the cremation of their garbage.]

ENGINEERS' CLUB OF KANSAS CITY.

THE first annual meeting of the Engineers' Club of Kansas City was held December 19.

There were present Messrs. W. B. Knight, W. H. Breithaupt, T. F. Wynne, J. A. L. Waddell, F. W. Tuttle, C. E. Taylor, George C. Stealey, W. Kiersted, C. G. Wade, K. Allen, and five visitors.

Nominations for officers were made as follows: For President, William B Knight, J. A. L. Waddell; Vice-President, Octave Chanute, A. J. Mason; Directors, T. F. Wynne, William B. Knight, W. Kiersted, William H. Breithaupt; Secretary, Treasurer, and Librarian, Kenneth Allen, William H. Breithaupt, it having been decided to unite the offices of secretary, treasurer, and librarian.

The President presented a subscription list for the purpose of defraying expenses of a dinner which he proposed the club should hold in the near future.

Dr. Waddell read a continuation of his "General Specifications for Highway Bridges of Iron and Steel," begun at the last regular meeting, and requested the endorsement of the club. It was voted that the President appoint three members of the club to consider the advisability of such action. Those appointed were Messrs. Chanute. Breithaupt, and Mason.

After a few remarks by Mr. Walker, of Cleveland, the club adjourned to hold its next regular meeting January 9.

NEW ENGLAND WATER-WORKS ASSOCIA-TION.

THERE will be an adjourned meeting of this Association at Young's Hotel, Boston, on Wednesday, January 11, T888

The rooms will be open for members at 11 o'clock A. M. The association will not be called together until after lunch, which will be served promptly at 1 o'clock P M. Lunch tickets, \$1.50.

Edwin Darling is President; R. C. P. Coggeshall, New Bedford, is Secretary.

BUILDING IN ST. PAUL.

(Special Correspondence.)

ST. PAUL, MINN.

The building in this city for the past year has been more extensive than in any other year since the city was incorporated. The total city and suburban building amounts to \$11,543,314. This is an increase of over \$2.000,000 from the figures for 1886. During the year, exclusive of the present December, permits have been taken out to the number of 3,953. There have been 102 buildings erected costing \$10.000 and over; one under way costing \$500,000, another \$300,000, another \$350,000. Over \$300,000 has been spent in school buildings. The total amount of money expended on minor permits was total amount of money expended on minor permits was \$3,644.173. Over \$100,000 was expended in churches; \$235.000 in railroad improvements; \$104,000 in manufacturing; \$603,000 at North St. Paul suburb; over \$1,000,000 at the stock yards, and nearly \$300,000 at St. Paul Park

PERSONAL.

FRANK BERESFORD, Asst. Eng., Cincinnati. Hamilton and Dayton Railroad, died on the 15th inst. of typhoid

LIEUTENANT JOHN BIDDLE, Corps of Engineers, U. S. A., lately stationed at St. Paul, Minn., is now on duty at West Point, N. Y.

F. N. FINNEY, C. E., Managing Director, Wisconsin Central Associated Lines, will sever his connection with this company after January 1, 1888.

COLONEL CHARLES PAGE, Med. Dept., U. S. A., has been appointed to the position of Assistant Surgeon-General, made vacant by the retirement of Dr. Perin.

EDWARD C. CABOT, President Boston Society of Architects, has lately been appointed consulting architect to the Board of Commissioners of New Suffolk County Court-House building.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

UNITED SEWER-PIPE MANUFACTURERS' ASSOCIATION.

THE United Sewer-Pipe Manufacturers' Association was in session last week at the Lochiel Hotel, Harrisburg, Pa., for the purpose, mainly, of considering the question of trade discounts. It was resolved to allow the full trade discount only to firms who simply sell pipe and agree not to engage in the business of laving it. Rochester, N. Y., Philadelphia, Camden, N. J., Boston, Portland, Me., Cleveland, Akron and Toronto, O., and other cities were represented at the meeting.

ARCHITECTURAL COMPETITIONS.

DULUTH, MINN.—Plans are wanted in this city for a two-story brick and stone school-house, cost not to exceed \$20,000, until February 4. Five hundred dollars is the premium offered for the plans adopted. Address George Rupley, Clerk Board of Education.

EAST SAGINAW, MICH.—Plans are wanted in this city for an eight room school-house, to cost, estimated, \$13,\$80, according to specifications. Until January 11. Address A. D. Camp, of the Committee on Building.

MINNEAPOLIS, MINN. — Instructions to architects desiring to submit in competition plans for a public building to cost \$1.150,000, to be erected in this city, have been prepared by the Board of Court-House and City Hall Commissioners, and they will be mailed to any address upon application to the Secretary, Charles P. Preston, 221 Second Avenue South, Minneapolis.

ST. PAUL, MINN.—The trustees and officers of St. Luke's Ilospital desire preliminary sketches of a new hospital building to be of brick, fire-proof, with all modern improvements. Plans accepted to be paid for. Plans to be submitted to Mrs. Oliver Dalrymple, President. Further information can be obtained of Mrs. Dalrymple, or of the Secretary, Mrs. James Gilfillan.

MESSRS. CABOT & CHANDLER, of Boston, have lately been chosen by the Trustees of Harvard College as architects of the Hastings Dormitory.

For works for which proposals are requested see also the "Proposal Column," pages i-iv-viii-79.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE ENGINEERING & BUILDING RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and rel able news for our "Contract ng Intelligence." Information of importance sent us exclusively, and not essewhere published, will be liberally paid for.

WATER. SEWERAGE, ETC.

BUFFALO.—The Common Council Sewer Committee has adopted a resolution providing that the City Engineer prepare specifications, and that a notice of intention be published, asking for bids for doing the work of ventilation of the trunk sewer according to Thomas Dark's plans.

VALDOSTA, GA.—Our correspondent writes from here: "Nothing has as yet been done toward water-works."

FRANKFORT, MICH.—Our correspondent writes concerning the project of establishing water works here, as follows: "Special election for bonding the village for \$10,000 will take place January 10."

NEWPORT, N.II —Our correspondent writes: "Routes have been surveyed from Long Pond in Croydon, and from Sunopee Lake outlet at Sunopee Harlor, distance between five and six miles each, at an estimated cost of \$50,000 to \$60,000. The Legislature of 1887 granted to Hon. Dexter Richards and Frederick W. Lewis a charter for a stock company, and the work will probably be undertaken in 1888."

WINFIELD, KAN.—Our correspondent writes: "The City Council has been considering the matter of establishing a system of sewerage for this city. Preliminary surveys have been made and a general plan prepared for the principal part of the city by the City Engineer, Charles B. Cook. The system as proposed would require some twenty-four miles of sewer, principally pipe. Final action has not yet been taken, and owing to the present depression in business, may be delayed until next season."

ALFRED CENTRE, N. Y.—Our correspondent writes: "A company has been incorporated, and stock books opened, for the purpose of putting in water-works. We anticipate commencing operations as soon as spring opens."

WEST WINSTED, CONN.—Partial surveys have been made for the improvement of the water-power here. Dams, canal, and tunnel from 2,000 to 3,000 feet long, preliminary to the work, are being constructed. Messrs. Hull & Palmer, civil engineers, of Bridgeport, Conn., have the work in charge.

NEW CANAAN, CONN.—Messrs. Hull & Palmer, civil engineers, of Bridgeport, Conn., write as follows: "Surveys and estimates have been made for water-works at this place, and plans of sewerage will soon be made."

WEEPING WATER, NEB.—An election has been called here for January 2 to decide whether or not to issue bonds in the sum of \$15,000 for water-works.

RANTOUL, ILI..—It is reported that Isiah Estep is at the head of a scheme to establish a system of water-works for this place.

MOUNT VERNON, N. Y.--The Board of Trustees have approved the plans prepared for sewering the village, and, it is said, work will soon be commenced.

BEATRICE, NEB.—About \$20,000 is to be expended on the water-works system here; 21,260 feet of additional pipe are to be laid.

ABINGTON, MASS.—The water-works system here will probably be extended by the addition of 21,000 feet of extra mains. The town will ask permission to issue \$30,000 in bonds for the improvement.

DELAWARE, O.—F. M. Marriott, attorney at law, of this city, writes as follows concerning the proposed water-works: "I have just organized a company, with a capital of \$100,000, to build water-works in this city. We have taken no steps further as yet, except to present propositions to the City Council for franchise, which, if granted on fair terms, will enable us to contract at once. We hope to be able to begin work in the early spring. The capital will be furnished at home."

ALLEGHENY, PA.—The Water Committees of the Allegheny Council met recently and determined upon going to Nine-Mile Island for water, which, if Councils consent, will be brought to the city in a steel main, five feet in diameter, costing about \$1,000,000, with a capacity of 32,000,000 gallons per day. The question now awaiting solution, and referred to Messrs. Cochrane, Swindell, and Robison for comparative estimates, is whether to put in light engines at Nine-Mile Island with sufficient force to carry the water to the City Water Works, where it will be repumped into the delivery mains, or whether to put in heavier engines to force the water 300 feet up a stand-pipe, which would give it sufficient head to distribute throughout the city, and thus abolish the present plant. It is said that the plan of building settling reservoirs at Nine-Mile Island will be abandoned. The reservoirs were estimated to cost about \$700,000, and it was suggested that it would probably be cheaper and more satisfactory to build a stand-pipe and put in a filter-system. The filter company which some time ago offered to put in their system at the water-works with a capacity of 20,000,000 gallons a day for \$300,000 has sent a communication to the committee offering to put in a plant with 30,000,000 gallons capacity at Nine-Mile Island for the same money. The committee will meet again to further consider the matter.

MONTGOMERY, ALA.—Mr. Rudolph Hering, C. E., of Chicago, Ill., has made an examination of the plans for the proposed system of sewerage for the city of Montgomery, Ala., and Captain Williamson, the City Engineer, will now proceed to finish the general plans for the work. Mr. Hering will make a written report to the City Council.

ALBANY, N. Y.—The special water commission at a recent meeting postponed the letting of the contract for furnishing pipe and other materials until January 3.

PORTERVILLE, CAL.—The place expects to obtain a water-supply from the Tulaie River and operations towards establishing a system are soon to be commenced.

AUSTIN, TEX.—The Capital Water, Light, Heat and Power Company will probably soon begin building water-works, and it is reported that they will add gas works and an electric lighting plant before long.

KANSAS CITY, Mo.—Address City Engineer Donnelly for particulars concerning several thousand dollars' worth of sewerage and street work which is to be done here, and for which he has plans prepared.

LEBANON, PA.—This city is to have a new sewerage system. For particulars address Mr. Riddle.

Welland, Can.—It is reported that waterworks, to cost \$32,000, will be erected here.

COXSACKIE, N. Y.—It is reported that a system of water-works will be established bere

CORPUS CHRISTI, TEX.—The Mayor can give information concerning a proposed system of water-works for this place.

BALTIMORE, MD.—1t is probable that the Water Board will spend \$300,000 for a high-service reservoir, and about \$60,000 in additional pumping-machinery.

WASHINGTON, O.—Water-works will probably be established here. Address F. Johnson for details.

MOUNT VERNON, ILL.—This place will expend \$25,000 on a water-works system, and steps are now being taken toward establishing the same. For particulars address Mayor George H. Varnell.

MINNEAPOLIS.—Bids opened for furnishing 2,000,000 brick for sewer-work in 1888. William B. Griswold offered to furnish the entire lot for \$11 per 1,000; C. J. Swanson, \$12. Decided to readvertise.

MINNEAPOLIS.—Bids for the new pumpingstation are to be advertised for, to be opened January 10.

BRIDGES.

HUNTINGBURG, IND.—Our correspondent writes. "We have decided to put a 100 foot span iron bridge, twelve feet wide, across Mill

GRAND FORKS, DAK.—In reference to bridge matters here our correspondent writes. "We have expended \$7,500 the past year in building bridges."

ELIZABETH, PA.—Concerning the proposed bridge over the Monongahela, to be erected here, our correspondent writes: "The Directory is determined to commence work on the bridge early in the spring. Will have plans and specifications in a short time."

McConnellsburg. Pa.—Our correspondent writes, concerning the report that a bridge was to be erected here, as follows: "Our Board of County Commissioners has erected one bridge this season, but have done nothing toward the second one, except procure estimates of cost of super and sub structures."

BRIDGEPORT, CONN.—A small bridge is to be built here.

TORONTO, CAN.—It is probable that two bridges will soon be erected here.

WASHINGTON, D. C.—A bridge is to be placed over the Potomac by the B. & P. R. R. HAMILTON, CAN.—The Niagara Central

HAMILTON, CAN.—The Niagara Central Railroad will construct a bridge here. Address the Common Council for details.

Digitized by

WRIGHTSVILLE, GA.—Laurens County has voted to issue bonds to the amount of \$15 000 for the purpose of building an iron bridge across the Oconee River at Dublin.

CHATTANOOGA, TENN.—The Market Street Bridge Co. is arranging for building a bridge, probably of iron. across the Tennessee River, at this place. Plans are being prepared.

WFSTFIELD, MASS—Our correspondent writes: "We have ordered the town of Chicopee to construct a bridge over canal about 80 feet long, not less than 72 feet, with 20 feet driveway; sidewalk on each side of 5 feet; the whole to carry a load of 80 pounds per foot, with a factor of safety of 4."

FORT WORTH, TEX —Our correspondent writes: "No action had as yet, but a petition is now before the City Council to assist in building a bridge in which private parties are mostly interested. I do not think it will go through, as we have a majority of the Councilmen elected in the interests of the people. It may go through next year."

GAS AND ELECTRIC-LIGHTING.

BROCKPORT, N. Y. — An electric-light plant will soon be established here.

COTTON WOOD FALLS, KAN.—An electriclight system is to be established here.

ALLEGAN, MICH.—A gas-well is to be bored

SIOUX CITY, IOWA. — The Sioux City Light, Heat, and Power Company has been incorporated. Capital stock. \$100,000. Emerson McMillan, and others, incorporators.

LOUISVILLE, KY.—It is reported that the Louisville Electric-Light Company will make extensive improvements to its plant.

REMERSBURG, PA.—A company has been formed here to supply the place with piped natural gas.

HOLLAND. MICH.—The residents of this place have requested the officials to do away with gas and substitute the electric light.

Brenham, Tex —An electric-light plant is reported to be erected. The Mayor can give information.

VANDALIA, ILL.—The City Council has granted to George W. Brown and others a franchise of the streets and alleys for thirty years for the purpose of laying gas-mains and pipes. The company will be known as the Vandalia Light and Fuel Company.

SYCAMORE, ILL.—It is probable that this town will soon have electric lights.

FREMONT, O.—The City Council has contracted with the Fremont Electric-Light Company, to furnish 30 lights at \$95 each per year, and it is expected that the plant will be in operation by January I.

IONIA, MICH.—The village officials think of substituting electric lights for gas in this place.

HAGERSTOWN, MD.—An electric-light company is being formed here for the purpose of lighting the public streets.

CHETOPA. KAN.—The question of establishing an electric-light system is being agitated here.

JAMESTOWN, DAK.—The Board of Trustees of the Insane Asylum Home contracted with the Edison Electric-Light Company, of New York, for a 220-light plant.

RAILROADS, CANALS, ETC.

LITTLE ROCK, ARK.—The City Electric-Railway Company will begin operations early in the spring, and are now getting figures on all kinds of plant. The line will be a dummy line, and three or four miles will be put in operation as soon as possible.

NEW ALBANY, IND.—A street-railway is to be constructed here by the New Albany Street Railway Company.

Los Angeles, Cal.—General Solicitor Bunson, of the Atchinson, Topeka, and Santa Fe Railroad Company, says that the company will build a road to Redondo Beach, 16 miles south-west of Los Angeles, to be in running order March I.

BIDS OPENED.

COLUMBUS, NEB.—Synopsis of bids for erecting a bridge over the Loup River, opened December 12 by John Stauffer, County Clerk:
King Bridge Co., Des Moines, Iowa, 4 span, 248 feet, superstructure only, \$27.024, with foundations complete. \$38,000; 5 span: 108 feet, superstructure only, \$24,500; with foundations complete. \$28,100

foundations complete, \$38,199.
W. J. Hobson, St. Joseph, Mo., 5 span of 198 feet or 4 span of 248 feet, complete, for

Milwaukee Bridge and Iron Works, Mil-Milwaukee Bridge and Iron Works, Milwaukee, Wis., 4 span, complete, \$38,300; 5 span, complete, \$37,909.

G. F. Fox, Norfolk, Neb., 4 span, complete, \$37,800; 5 span, complete, \$37,400.

Smith Bridge Co., Minneapolis, Minn., complete, for \$41,000.

Wrought Iron Bridge Co., Canton, Ohio, wrought Iron Bridge Co., Canton, Ohio, and the span and the for \$41,800; 5 span, complete.

4 span, complete, for \$41,800; 5 span, com-

4 span. complete, for \$41,800; 5 span, complete, for \$43,500.

Kansas City Bridge and Iron Co., Kansas City, Mo., 4 span superstructure, \$25,500; substructure, \$13,400—\$38,900; 5 span superstructure and substructure, complete, \$38,900.

Missouri Valley Bridge and Iron Works, Leavenworth, Kan., complete, as per plans,

\$38,900.

\$38,900.
P. E. Lane, Chicago, Ill., 4 span, complete, \$38,498; 5 span, complete, \$37,888.

Board awarded contract to the King Bridge Co., of Des Roines, Iowa, 4 span of 248 feet each, for \$38,000.

BROOKLYN, N. Y.—Synopsis of bids for repairing the turning gear of Hamilton Avenue Bridge, opened December 20 by the Board of City Works:

White & Price, work complete, \$3,900; Norman Hubbard, work complete, \$3,175; Patrick Fox, work complete, \$3,175; James Dillon, work complete, \$2,987.

ASHLAND, PA.—Council has awarded the contract for lighting the streets during 1888 to the Ashland Gas Company, who will turnish Thomson-Houston electric lights of 2,000 candle power at \$100 per lamp.

JUNEAU, WIS.—Synopsis of bids for furnishing apparatus and material and doing all necessary to heat the Dodge County Court-House by steam, opened December 14 by Louis Rushlow, Chairman of the Committee on Public Buildings:

Miller & Reichert, Watertown, I,650 square

feet of radiating surface and one boiler, \$1,885. Additional expenses of extras, \$425; total,

\$2.205.
Samuel I. Pope & Co., Chicago, 1.744 square feet of radiation and one boiler, \$1,659.
King & Walker, Madison, 2,000 square feet of radiation with covering, and one boiler,

f. 1,961.

C. L. Rundell, Oshkosh. 1,800 square feet of radiation, two boilers, all conducting pipes covered, \$1.961.

Krause & Barker, Milwaukee, 1,372 feet radiation, two boilers, and all pipes covered, in basement, \$1,704.

A. B. Taylor, Fond du Lac, radiation, 2,000

square feet. pipe covered in basement, two

boilers in one section, \$1,950.

Moores & Co., Milwaukee, put in three bids, one for \$2,500, one for \$1,800, and one for

\$2,000.
The contract was awarded to C. L. Rundell, of Oshkosh.

MILWAUKEE, Wis.—Synopsis of bids for furnishing and erecting the pumping engines and boilers for the flushing tunnel pumping station, opened December 22 by the Board of Public Works:

Public Works:

The specifications call for pumping machinery of sufficient capacity to raise and deliver continuously 32,000 cubic feet of water per minute, from three to three and a half feet high, with boilers and engines suitable for operating the machinery.

E. P. Allis & Co., of Milwaukee, offer to furnish a vertical compound condensing pumping engine to be placed in a water-tight caisson, about 24 feet long. 15 to 10 feet wide and 18 feet deep, iron influent and effluent conduit gates, and four boilers 54 inches in diameter and 16 feet long, for \$37,500. diameter and 16 feet long, for \$37,500.

The Quintard Company, of New York City,

submitted plans which provide for four small engines, instead of one large one, with the

accompanying machinery.

The contract was awarded to E. P. Allis &

PHILADELPHIA, PA.—Proposals were received at the Park Commission office, for the construction of certain heating apparatus in Horticultural Hall, made necessary by additions to the Hall. The specifications calling for a 30 horse-power Harrison boiler, with radiators, coils pipe and apparatus complete, and the following bids were received: H. T. Moss. \$1,803; Philadelphia Steam Heating Co., \$1,819; J. P. Wood & Co., \$2,000; Thompson Bros., \$2,097; H. B. Smith Co., \$2,000

Bids for lighting the streets of the city during the year 1888 with electric arc lights, of 2,000 candle-power each, were opened by Director of Public Works Wagner on December 24, and the following received:

From United States Electric Light Co., 50 cents per night for each light used from north side of Market to south side of Poplar streets,

and from Broad to Delaware River.

Brush Electric Light Co., 47½ cents each for lights south of Market, north of Spruce, from river to river; 50 cents each from south side of Spruce to north side of Washington avenue; in West Philadelphia, 50 cents each;

of Market, south of Callowhill and west of Broad streets. 47½ cents each.

Keystone Light and Power Co., 35 cents each from Arch to Walnut streets and from

north of Poplar and east of 13th streets.

Philadelphia Electric Light Co., west of Broad, north of Callowhill, 47½ cents each; north from Callowhill and 8th to Broad, 49½ cents; north from Callowhill, between 6th and oth, 52 1/2 cents each.

Germantown Electric Light Co., 55 cents

each for the lamps in Germantown.
Frankford Electric Light Co., all in 23d and part in 25th Ward, 55 cents each.
Wissahickon Electric Light Co., all lights

Wissahickon Electric Light Co., all lights in Manayunk at 55 cents each.

The bids for the coming year are somewhat of a reduction from the prices paid for 1887 This year the average cost for each lamp was 54½ cents per night, but the average for the next year will be about 50 cents, and the total cost for 1888 will be about \$95,000.

Boston.—The following proposals were received on Saturday, December 24, for rebuilding a wharf owned by the Paving Department: John J. Scully, \$6,375.45: J. N. Hayes & Co., \$6,700: William A. Norton, \$6,975; McInnis & Parker, \$7,645: Benjamin Young, \$6,326.50; F. G. Whitcomb, \$7,520; W. A. Kendrick & Son, \$6,609.50. The contract was awarded to Mr. Young, the lowest hidder.

A COLLECTION OF DIAGRAMS

Representing the General Plan of

TWENTY-SIX DIFFERENT WATER-WORKS,

Contributed by Members of the

New England Water-Works Association,

And Compiled by a Committee.

1887.

NEW YORK: PUBLISHED BY THE ENGINEERING AND BUILDING RECORD, 82 & 84 FULTON STREET.

INTRODUCTION.

OFFICE OF SECRETARY.

NEW BEDFORD, MASS., November 1, 1887.

NEW BEDFORD, MASS., November 1, 1887.

THIS collection of diagrams is the result of the persistent efforts of Messrs. Wirliam B. Sherman, of Providence, R. I., and Walter H. Richards, of New London, Conn., who, as a Committee on Exchange of Sketches, have secured these drawings from members of the Association. The following extract from a report presented by these gentlemen at the Manchester, N. H., meeting in June, 1887, will explain in part the origin of the collection:

"In answer to circular letters sent out to members, there were received rough sketches of general plans of twenty-three water-works represented in the Association. Having this data on hand, though crude in many particulars, it was decided to put the same into available shape for the benefit of the members. This has been accomplished by the Committee without cost to the Association. From these rough sketches—revised, reduced to uniform size of 10 by 15 inches—a set of tracings has been made, and a sample tolio of blue prints prepared. This folio and set of tracings are herewith presented as forming the main part of this report."

Since the Manchester meeting three more subjects have been received and subscribtions for sets of reproductions from the tracings have been called for. The ready response to the call is evidence of the value of the Committee's work, and arrangements were made with The Engineering And Building Record for publication in this present form.

R. C. P. COGGESHALL.

THE NEW YORK QUARANTINE VER-SUS NATIONAL QUARANTINE.

THE report of the committee of physicians requested by Mayor Hewitt to investigate the condition of the Quarantine Station of the port of New York will be found elsewhere in this issue. The substance of it has doubtless been telegraphed to all parts of the world. The character and professional standing of these gentlemen and their well-known desire to eliminate political effect from any statements they may make will no doubt compel the Legislature to take some action that will temporarily, at least, result in some improvement. We would, however, again urge the present Congress to pass a law providing for a system of National Quar-

The present disgraceful condition of affairs at the leading port of the country is the natural result of permitting a State to manage a matter vitally affecting the whole country, levying taxes and securing funds from the commerce of the world which is largely to be used by the political party in control in the State. The fact that the buildings and property in this instance are in such a wretched condition is because a Democratic Governor is unwilling that Republican officials shall handle the money needed to make them habitable. On the other hand, a Republican Legislature has for years refused to confirm the appointment of Democratic officials in order that the latter may be deprived of an opportunity of handling the funds that are received.

It is now announced that the Republican majority in the Legislature, realizing that public sentiment is so aroused that they must permit the appointment of new officials, propose to "dismantle the Quarantine fortress" by abolishing the present system of compensating the Health Officer by fees, which he has to divide with his party managers. It is proposed to pay him a salary, and have the fees collected go to the State. Whether, at this late day, this desirable reform is instituted or not, we simply call attention to the spirit that moves these State authorities in dealing with such a national question, and predict that no permanent improvement or adequate protection for the country at large will be received until the United States Government takes the whole matter in charge and becomes responsible for it.

PROGRESS IN CAR-HEATING FROM LOCOMOTIVE.

IT is a hopeful sign when we see announcements like the following in the daily papers from our railway companies in their efforts to secure patronage:

"The Wagner Vestibuled Limited trains, running over the New York Central and Lake Shore roads between New York City and Chicago, are the only trains between these points that are heated by steam throughout the en-

We understand that the Pennsylvania Railroad Company's vestibule train running between New York and Chicago is also heated by steam from the locomotive. On the other hand, we noticed that the cars on the 11 o'clock train from Boston on the Boston and Albany route on last Saturday were still heated by the car-heater, and on this occasion one of the heaters in the drawing-room car was so overheated that

there was a risk of the car taking fire; indeed, the wood-work of the door to the enclosure containing the heater was blisterea. This drawing-room car, though apparently a new one, had only single windows, which made it difficult to heat the car on a cold day with the pipes provided. The chairs were, also, so crowded into the space that it was difficult to turn them without incommoding a neighbor. On the whole, the impression made on the patrons of the road was one of petty meanness on the part of the management, unworthy of so wealthy a corpora-tion as the Boston and Albany Railroad Com-

CEMENT WATER-PIPE.

WE have received from Mr. L. Battin, C. E., of Elizabeth, N. J., a communication which particularly recommends a "cement wrought-iron pipe," which, he claims, has special features of merit. The points made in his communication are, First, that capitalists consider cement water-pipe to be an insufficient security for money loaned, and therefore the question of the true merits of these as compared with cast iron is lost sight of in the greater one of security for loans. greater security, according to Mr. Battin, would seem to be in the raw material. He truly says no lender ever yet dug up water-pipe to settle a claim, and, we may add, he probably never will.

The statement is made that out of 700 waterworks in the country, 150 use cement pipe. Also that twenty years' experience with forty miles of cement pipe, and an extended experience with cast iron, have made him give the preference to cement over iron pipe, the reason being that after twenty years' use it is free from all concretions and tubercles, and retains its full capacity, which is never the case with cast

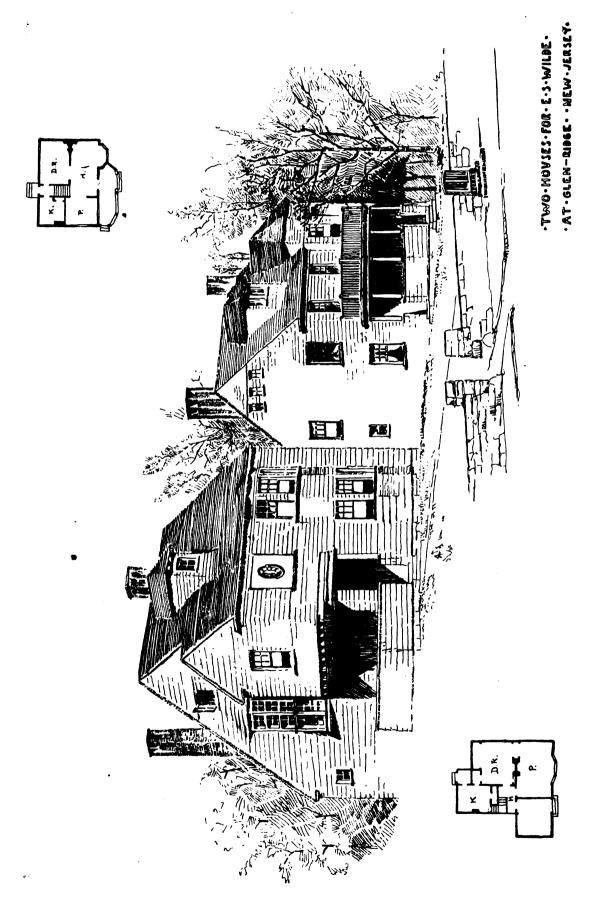

-He acknowledges difficulties in its Second .use requiring the best of materials and careful trenching. This brings in the mention of the patent pipe which has a perforated exterior iron jacket to retain and protect (until placed in the trench) the outer cement coating 3/4 of an inch thick which is put on this pipe at the factory.

We entirely dissent from the first proposition. Capitalists invest in water-works bonds because they believe the franchise and works, as a whole, of value, and they prefer cast-iron pipe because in almost all conditions it has been found most durable. We opine that the 40 miles mentioned are under a low head, and are no doubt doing good.work. Again, they are in a compact soil and not liable to settlement if laid with any care. We believe the experience with cement pipe where laid on yielding soil has been unfavorable, and from a neighboring city where under considerable pressure we learn there have been many failures at the service-taps. At such points the water gets access to the iron and gradually rusts it until failure ensues. Cement pipe when well laid under suitable conditions will no doubt give satisfactory results, but cast-iron will, as a rule, always be the mainstay for water-works.

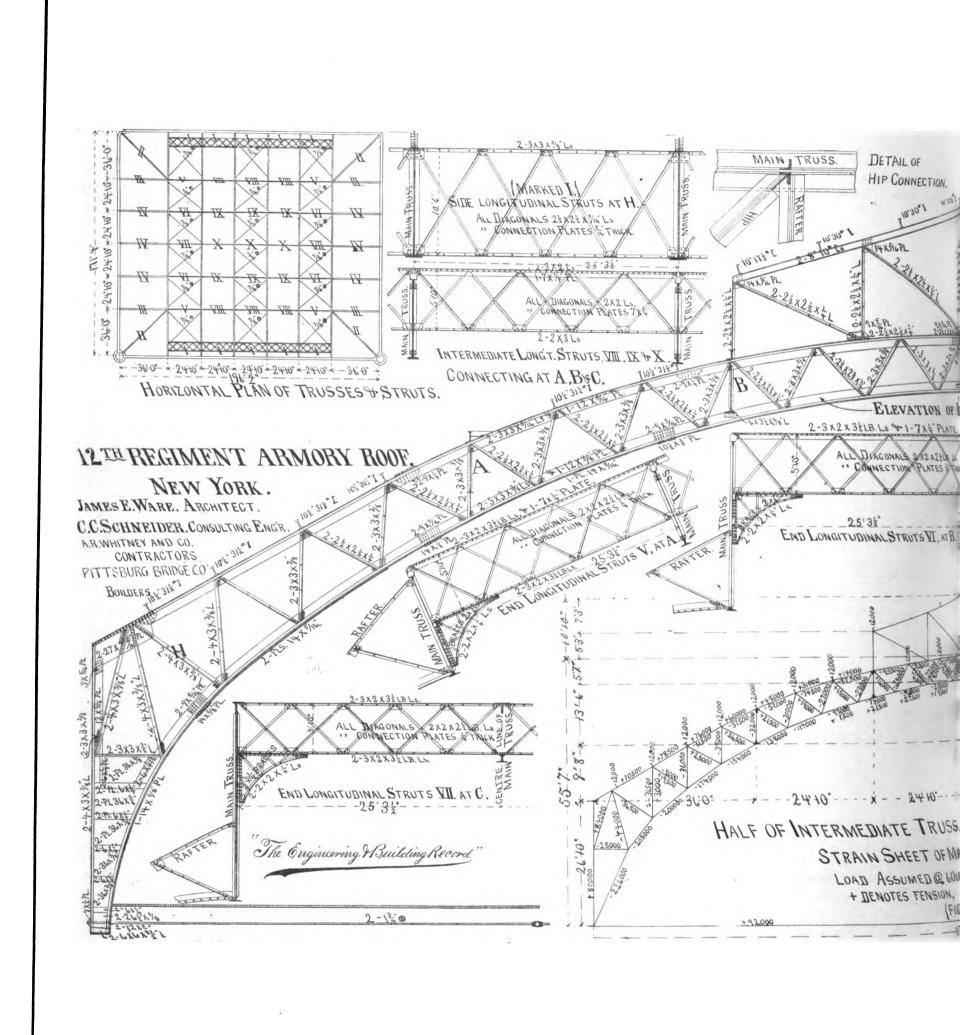

MICROCOCCUS SCARLATINÆ.

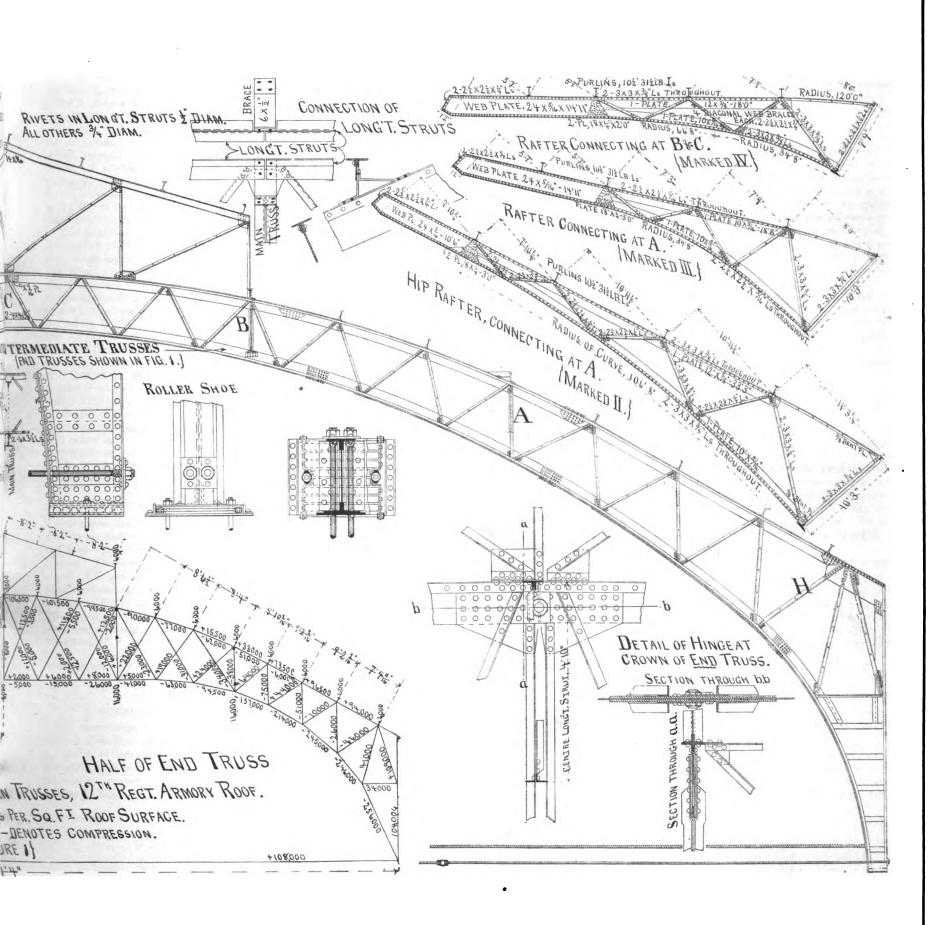

THE supplement to the sixteenth annual report of the Local Government Board of England, containing the report of the Medical Officer for 1886, forms a volume of 450 pages, which, as usual, contains much that is of interest, not only to sanitarians, but also to scientific men. If, for

W. C. HAZLETT, ARCHITECT.

example, we turn to the reports of the investigations of Dr. Klein into the cause of scarlet fever, it is certainly a matter of great interest to learn that he finds in the blood of children affected with scarlet fever a peculiar, very minute micro-organism which can be cultivated on gelatin or blood serum; that this appears to be the same sort of micro-organism as that which he had found the year before in sick cows, the milk from which had caused a small scarlet-fever epidemic, and that when this "micrococcus scarlatinæ," as he calls it, is inoculated on calves it produces in them a disease which seems to be identical with the disease of the cows above referred to. Furthermore, the same micrococcus was found in a tin of condensed milk which was one of a lot which seemed to be connected with a small outbreak of scarlet fever. It also appears that monkeys may be affected with a disease which, to say the least, is remarkably like scarlet fever, and that in one monkey thus affected the peculiar micrococcus was found in the blood.

The practical interest and importance of such researches is, of course, apparent, but even putting these aside, no one can read the details of Dr. Klein's experiments, and see how he took up and answered one question after another, without being interested in it merely as a specimen of scientific method. And while the evidence produced by Dr. Klein is not altogether satisfactory for several reasons, one of which is that there seems to be more than one kind of micro-organism connected with what we call scarlet fever in man, and that there may be more than one kind of scarlet fever, it nevertheless points unmistakably the direction in which further research should be made, and emphasizes the desirability that the Government should provide laboratory facilities and other means for making such researches, as being one of the best possible means of investing a small part of that "surplus" which at present seems to trouble some of our statesmen so much.

OUR ARCHITECTURAL ILLUSTRATIONS.

OUR special illustration is the new depot of the Canadian Pacific Railroad Company at Montreal, Can. Material used, stone, Scotch rubble face, with rock-face belt courses. The interior is hard-wood finish of Vancouver cedar. The general waiting-room, arched over, with granite column supports, carved cap, and arches finished in plaster. Floors made with iron beams, fire-proof finish. The cost is about \$250,000. There will be a train-shed about 500 feet long. The architect was Bruce Price, of New York.

TWO HOUSES FOR E. S. WILDE AT GLEN RIDGE, N. J.—W. C. HASLETT, ARCHITECT.

SUBAQUEOUS TELEPHONES.

WE seem likely before long to have some teasible method of telephonic communication at sea. Mr. Edison is reported to have signaled through a mile of the Caloosahatchie River in Florida, and by means of a submerged microphone, connecting with a telephone above, Professor Lucien J. Blake was able to receive subaqueous signals

from a locomotive bell a mile and a half away on the Wabash River and through three or four windings.

The Electrician also records some experiments of Mr. H. F. Boyer, of H. M. S. "Malabar," and presumably made on board that vessel. He uses a large submerged gong, operated from the bridge, to give the signals, and they are in turn received on a modified Bell telephone in the centre of the gong connected with an ordinary telephone on the bridge. Mr. Boyer has also used small explosions of gun-cotton in place of the gong, but, in view of the experiments of Messrs. Edison and Blake, it is rather surprising to find that he does not claim to be able to hear distinctly the explosion of one ounce of gun-cotton at a greater distance than one mile, unless the difference between smooth river-water and a rough sea will account for it.

Of course, in all the above methods it would be necessary to use the Morse alphabet or something like it. Such signals under the sea are independent of fogs or stormy weather; and they hold out the possibility of lighthouses and lightships being able to signal vessels at all times. Moreover, ships, in addition to signaling each other, could also signal lightships, or announce their number to marine telegraph stations, if the system proves successful.

THE MACHINERY OF SMALL BOATS.

A VALUABLE paper, entitled "The Machinery of Small Boats for Ships of War, etc.," was lately read before the British Society of Naval Architects by A. Spyer, Esq. This paper gives a résumé of what has been done during the past ten or twelve years to increase the speed and efficiency of small craft for naval and other uses. It gives a great deal of valuable data about the details of construction, including the power necessary to propel boats of different sizes at different speeds. It also gives particulars of the weights of various types of machinery, with their economy in fuel, etc. Parties interested in this subject can obtain copies of this paper gratuitously from Mr. Frederick M. Wheeler, of No. 93 Liberty Street, New York, who has published the article in pamphlet form.

PRECAUTIONS AGAINST FIRE IN NEW YORK THEATRES.

ALL theatres must have proscenium walls. All openings in proscenium wall to have double iron or tin-covered wooden doors. Roof over stage to have a skylight or skylights equal to ½ area of stage, opening automatically. All doors must open outwardly. Each gallery must have two staircases or equivalent in fire-escapes.

The person having charge of any theatre shall cause

The person having charge of any theatre shall cause every means of exit to be conspicuously numbered, and shall have a plan showing each of said exits and referring to the numbers aforesaid printed in conspicuous type on the programme of the play.

The signal-boxes placed in a number of the theatres

The signal-boxes placed in a number of the theatres connected with the system of special building signals are each provided with a glass front and a mallet for breaking the glass to give access to the handle used in sending an alarm.

The chiefs of battalion shall detail for duty at theatres and places of public amusement where scenery and stage machinery are used, their best, most reliable, cool, discreet, and experienced men, who have served two years or more in the uniformed force of this department. They shall be on the stage a half hour before the performance commences, and remain after its close a sufficient time to make proper examination and assure themselves that all is secure from fire.

All lights used in theatres and all other places of public amusement shall be properly protected by globes, glass coverings, or in such other manner as the commissioners shall prescribe. THE ROOF OF DRILL-HALL OF TWELFTH REGIMENT ARMORY, NEW YORK.

This drill-hall roof forms but one of many interesting features of the large and appropriate armory building, which is further noticed in this issue.

The drill-hall has an unobstructed floor of over three thousand square feet for the comfortable execution of company tactics, and is handsomely spanned by six riveted arch trusses, hinged at the crown and tied at springing line by rods passing through the foot of the pedestal and carried across just below the floor-line. The arch web is of solid plates for 17 feet from the base plate, and the first 24 feet of extrados, up to top of wall, is vertical, enabling the truss to join neatly and imperceptibly to the brick-work, increasing the effect of solidity, while being actually independent of the walls it transmits neither weight nor strain to them and cannot rack them through distortions of its own members.

One foot of the arch is anchored to the masonry, the other is cardied on expansion rollers that are guided vertically and laterally, but permit temperature movements in the direction of the truss. The intermediate arch trusses are spaced 24 feet 10 inches centre to centre, and have a depth of 5' 7" at crown, the web members throughout forming a simple triangular bracing system of diagonal angles in pairs.

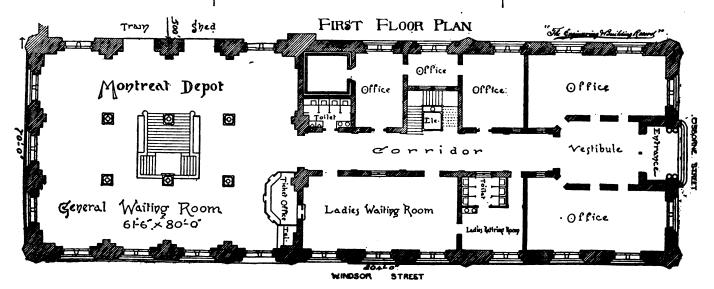

The end arch trusses are spaced 36 feet from the end walls and carry both square and hip rafters. Their strains are therefore greatly augmented, and while the upper roof line is preserved coincident with the other trusses the crown depth is increased to 19' 1" by dropping the lower chord; and the web bracing above the haunches becomes in effect a simple single intersection Warren girder. The greater crown depth also requires and is provided with special hinge in top chord and sliding joint in bottom chord, as shown in general illustration.

The rafters are a combination of plate and lattice girder, with top and bottom chords curved to correspond to the lines of the arch trusses. The connections are made at the intersections of the chords and of the lower chord and web. The chords are constructed with a vertical web plate forming a T-section, and affording easy connection of web diagonals. The purlins are rolled I-beams 10½ inches, 31½ pounds, spaced from 5 feet to 8 feet apart, and located, both on arch trusses and rafters, always at an apex of web members.

Simple Warren girder trusses, 5 feet and 6 feet deep, the diagonals of single and the chords of pairs of angles, form five lines of longitudinal bracing continuous from end arch truss to end arch truss and extend to end walls by rafters abutting in same vertical plane; their connections embrace nearly the whole vertical intersection of the intermediate arch trusses, and form an exceedingly stiff system.

After erection additional stiffness at the haunches was considered desirable, and two more lines of longitudinal girder struts, about ten feet deep, were added at the point H (see general drawing) in a plane inclined about 45 degrees from the vertical, to prevent lateral deflection of the bottom chords.

In the end and centre panels diagonal lateral rods are placed in the plane of the top chord, forming, with the struts and trusses, an efficient system of wind-bracing. A very wide lantern and ventilator surmounts the crown

and affords ample side lights. The entire roof is of steel. and all connections are made with steel rivets.

The arch trusses were shipped from the shop in eight segments each, and erected with three shear poles that raised the pieces into position and sustained them until bolted up and stayed by the struts and furring.

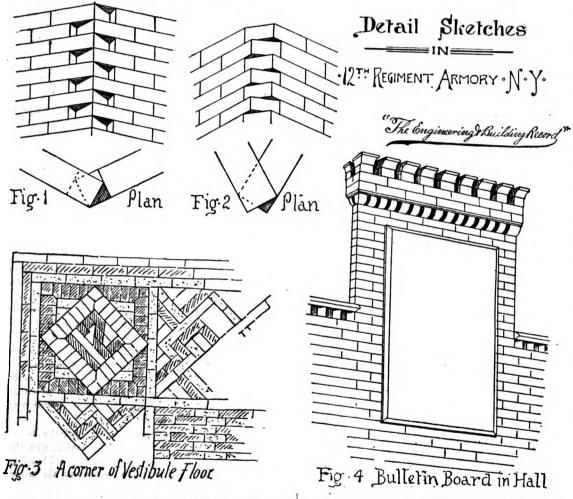

A novel and very economical and effective feature of the interior construction of the Drill Hall was the support of the balcony, carried in effect by longitudinal plate girders, which form a front panelling; and by the transverse plate girders which connect with these longitudinals, the main transverse girders are simple cantilevers supported by columns about nine feet from the extreme end, and built two feet into the solid wall, which anchors them by the weight of all the brick-work above. The longitudinal girders are carried by these cantilevers, and in their turn support the outer ends of the intermediate transverse girders which have no columns.

SOME ARCHITECTURAL FEATURES OF THE TWELFTH REGIMENT ARMORY.

FROM the quarry-faced granite base that everywhere underlies the structure, the walls of common brick, in red mortar, are raised. The long curtain-walls that stretch between the towers are gathered into buttresses of semi-circular form, which rise from the outer face of the granite base, while the walls between, starting on the same line, are reduced in thickness by a uniform batter about four for a height of five feet from the floor. It is laid in red mortar and capped with a saw-toothed and molded cours e of brick. The openings for doors and corridors have semicircular arches of brick, with label moldings like the dado cap. The walls from dado cap and from label moldings up and the ceilings are left in the browning plaster and treated with distemper.

As an example of the neat finish obtained with the brickwork note the sketch of bulletin board, Fig. 4.

The fire-places throughout are of Philadelphia pressed brick, with very little trimming of stone or granite, and no mantel, but a single shelf of stone. Some of those in company room have the crown molding of lockers carried across the breast The wood-work, except floor, is of oak, tinged with ammonia and finished antique. It is very sparingly used, and the moldings and trim are heavy and simple, being, like the quarry-faced granite, in harmony with the brick-work and rough plaster. The main hall, with its great oaken staircase with beams showing under landings and stairs, and the great trimmer beam supported in the centre by the large square newel-post. is in the style of the Fifteenth Century. The immense drill-room is simple in the extreme, the great iron and glass roof, which is in one clear span, giving every opportunity for free movement on the floor.

feet high, then are carried up perpendicular. They are again brought out by a series of arches that spring from granite corbels, and this corbel-course in turn carries a high parapet wall pierced at regular intervals with loopholes and coped with quarry-faced granite.

All the exterior walls, except a little about the main entrance, are of plain, unmolded brick-work. The semicircular buttresses are built of headers and the angles other than right angles are built as shown in Figs. 1 and 2 without cutting the brick.

The doorways are plain, massive arches of cut granite, and the walls about the main entrance are of squared granite to the sills of the second story windows, then are carried up in brick in the form of a tower with turrets and battlements. One steps from the granite threshold of the main entrance on to the brick pavement of the vestibule. which is of ordinary front brick in three colors laid on edge in patterns as shown in Fig. 3; the centre is of two colors only and shows the ends of the bricks.

In the halls the brick-work of the partitions is exposed

PAVEMENTS AND STREET RAILROADS.

No. XXV.

(Continued from page 68.)

REPAIRING, CLEANSING, AND WATERING.

FROM a report by Mr. George Livingston, C. E., Surveyor of St. George's, Hanover Square, London, we gather the following information.

There are forty-two miles of paved streets in the parish. With the exception of Piccadilly and two miles paved with other materials, all of these are macadamized, the road metal consisting either of granite, flints, or gravel. The labor of maintenance is performed by what is called a "lifting" gang, the men being paid fourpence per hour. The engineer and stoker of the road-roller receive more. This gang is supplemented for a part of the year by men called "district roadmen."

The average annual cost of maintenance of the macadamized streets, based on the traffic and cost of the past five years, is estimated at 2s. 6d. per yard for the future,

and the estimate for granite, including renewal in thirty vears, is a trifle more than one-half as much. The addition of cost of cleansing in each case would make the disparity still greater.

Four systems of maintenance and repair are discussed: First-By contract under fixed prices for labor and materials. The difficulties of determining the exact condition the streets shall be in at the expiration of the contract, and of getting efficient contractors is dwelt upon. The convenience of a large staff of workmen is also men-

Second-By piece-work or part contract. The vestry would by this supply the materials and the contractor the labor and tools.

Third-By a superior class of men in the employment of the parish. This is essentially the present plan, except that by offering a higher price for labor better men would be obtained.

Fourth-By the substitution of a different description of payement.

Street cleaning is considered one of the most important matters to deal with. It is done in part by contract and in part by the parish staff. There are in the employ of the parish in the "in wards" twenty-two men, one foreman, and a sweeping-machine. Men are paid 2s. 6d., foreman 3s. 6d. per day, beginning at 4 o'clock in the morning in summer and 6 o'clock in the winter. Sweepings are removed by carts as soon as possible. The sweepers are mostly paupers and cost more on account of small quantity of work done than a better class of labor. Having no water-proof clothing furnished them, no work is done in wet weather. In the out wards there are thirty-two districts, in each of which a roadman sweeps the crossings and collects the refuse by barrow for removal by the carts. He also does all repairing needed. The total annual cost for cleaning the streets is about £10,000.

"Notwithstanding this large outlay, the streets of the parish (in the opinion of the committee) continue to be most inefficiently cleansed. The nuisance most complained is, that the mud is swept from the centre and deposited in large heaps at the sides of the road in or near the chan-nel, where it is left for an unreasonable time to the great inconvenience of the public. The simple cause of this is that the streets which have been swept yield a greater quantity of mud than can, by the present system, be requantity of mud than can, by the present system, be removed. This is due chiefly to an insufficient staff of horses and carts to remove the slop and the difficulty attending its ultimate disposal. Any increase, therefore, in the staff necessary to perform this work more rapidly must entail additional expense.

"The difficulties in the way of a speedy cleansing of the streets, however, under existing circumstances are numerous. The chief are:

"First-The nature and condition of the pavement to be cleansed.

"Second-The imperfect method of sweeping.

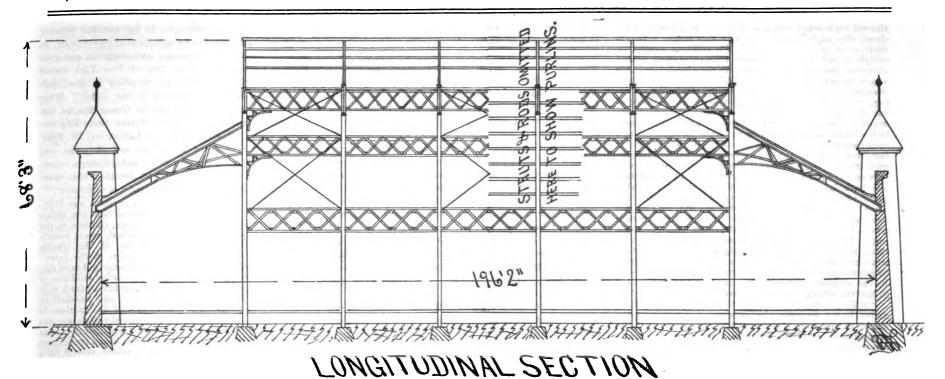

"Third-The amount of mud to be removed.

"Fourth-The objectionable and dilatory method of removal.

"The cleansing of the streets, both as regards its cost and efficiency, depends, to a very great extent, upon the description of pavement of which they are composed; and it cannot be disputed that macadamized streets (such as most of the thoroughfares of this parish), subject to heavy most of the thoroughtares of this parish), subject to heavy traffic, yield a much greater quantity of mud than any other pavement. For example, the average quantity of slop removed from the macadamized portion of Piccadilly (previous to its being paved with wood), between Engine Street and Hyde Park Corner, comprising an area of about 8,600 yards, was seldom less than from 25 to 30, and frequently of the second second part leads a day in most weather. quently as much as 40 cart-loads a day in wet weather; notwithstanding this, the roadway was never in a satisfactory condition. Whereas, since it has been paved, the average quantity of slop removed, under equal conditions, tory condition. Whereas, since it has been paved, the average quantity of slop removed, under equal conditions, from the entire length of the roadway—nearly three-quarters of a mile—representing an area of about 20,000 yards, does not exceed 12 cart-loads a day, the greater portion of which is a valuable manure. Every one who has observed the roadway under the two conditions of pavement must be carefully of the year improvement that he have effected be sensible of the vast improvement that has been effected. I have no hesitation in saying that Piccadilly, which was formerly one of the worst kept and filthiest roads in the parish, is now, considering the labor employed, one of the handsomest, cleanest, and best kept thoroughfares in the

metropolis.
"The surface of streets, under certain conditions, is frequently covered with a thick, sticky, greasy mud, due to various circumstances, the state of the atmosphere, the situation of the street, and the influence of wind and sun, etc., which the present system of sweeping, especially on macadam, utterly fails to remove, and which is the occasion of serious accidents. According to some returns of the Registrar-General, the average annual number of persons killed in the streets of London is about 200, and the number injured by accident about 2,000. The greasy and elippers state of the streets is often the cause of these number injured by accident about 2,000. The greasy and slippery state of the streets is often the cause of these casualties.

Digitized by Google

DETAILS OF TWELFTH REGIMENT ARMORY, N. Y.

"The macadamized roads, also, at times, are 'permeated with the solutions of the surface dung deposits, and become excrement sodden,' the dry decomposition of which neither the broom-sweeping nor the scraper can wholly remove; and the moist exhalations produced by street-watering (during the process of evaporation), especially in hot weather, are most offensive. As a matter of public health and safety, therefore, the perfect cleansing of the roads and streets is most essential. The quantity of mud and slop to be removed from the streets depends entirely upon the condition of their surface and the nature of the weather; and the accumulation swept from the streets of this parish, which averages about 30,000 loads a year, is so great that its speedy removal from all the streets is, under present arrangements, impossible. This is, in great measure, due to the fact that the entire bulk, after having been scooped up in shovelfuls, has to be removed by horses and carts. A more filthy, more costly, and less speedy method of street cleansing cannot be well imagined, and there are many who regard it as discreditable to the sanitary arrangements of this capital.

"If the cleansing of the streets is continued to be done

"If the cleansing of the streets is continued to be done on the present principle, there is an obvious remedy for the evils complained of, provided the necessary expense is incurred. Suppose, for instance, it is required to have the whole of the streets in the parish cleansed by a certain hour in the morning (say 10 o'clock), all that would be necessary would be to employ a sufficient number of men to sweep the mud and dirt from the streets before that time, and to make it imperative upon the contractor to remove it; but the cost of providing such a staff would be serious. In cleansing thoroughfares, especially those of great traffic, speed and efficiency are of the first importance; any scheme, therefore, to be proposed for the better cleansing of the streets must have regard to such results. One method which I venture to suggest, by which this might be effected would be by fixing in each of the principal streets of the parish a number of hydrants, at convenient distances apart, to which suitable lengths of hose-pipe could be attached. By this arrangement, the whole length of a street could be thoroughly cleansed in a comparatively short time, and after the street had been washed by the application of water in this manner, and swept by an India-rubber broom or squeegee, made on the principle of the present horse-scraper, so as to remove any wet or moisture from the surface, it would be rendered perfectly dry and free from every description of filth.

"Under existing arrangements, the sweepings of the

"Under existing arrangements, the sweepings of the streets (as before stated) are removed by contract, and it is naturally the object of the contractor in performing this work to avoid as much cartage as possible; consequently, in wet weather, the mud and slop are often either left at the sides of the streets, or are, as is frequently the case, when opportunity offers, swept into the gullies. The adoption of the hose-pipe, however, would dispense almost entirely with scavengers, and also with the annoyance and labor of cartage; for, by the application of water, the sweepings of the streets would be put in such condition as to cause them to pass off immediately into the sewers.

"The passing of this liquefied mud through the sewers

"The passing of this liquefied mud through the sewers might be considered objectionable, as being likely to choke them up. I am of opinion, however, that, so far from creating any stoppage in the sewers, the operation would be most beneficial, as it would have the effect of flushing them. This hose or jet system is not new; and Mr. Heywood, the City Engineer, who tried it, states with reference to the effect it had upon the sewers that 'during the experiment in street-washing I had the gullies and sewers within the city carefully examined from time to time, when they were found to be not only as clean as they had previously been, but, if anything, cleaner; and, indeed, I think that if the surfaces of the city pavements were

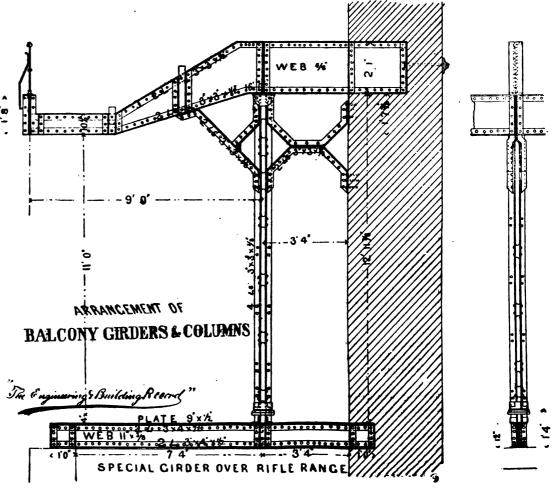

cleansed by water alone, both gullies and sewers would be cleaner than at the present time, for, as before stated, much dust or dirt is now swept into them in such condition that the usual current does not readily move it, whereas, if the streets were daily washed, nothing would go into the sewers excepting that which found its way there by reason of its fluidity.

of its fluidity.'

"Where the streets are paved as in the city, no reasonable objection could be raised to the adoption of such a system; with macadamized roads, however, it might be different. Under any circumstances, the hose-pipe would have the effect of thoroughly cleansing the streets of all their impurities, no matter what might be the nature of the pavement or the condition of its surtace; and it would be equally applicable and effective in all weathers, frost excepted. Under the present arrangements, and during dry weather, it is at times quite impossible to remove the dust and dung, etc., which accumulate in the streets, and which, as I have already stated, under certain conditions are the cause of offensive smells. To in part mitigate this nuisance. I have caused the streets to be swept during the early hours of the morning; and although this has genererally speaking been, to some extent, successful, it cannot

at all times be performed with good effect, for in certain seasons the ground is during the early morning so damp from heavy dews that sweeping alone fails to remove the dry dust and other offensive matter from the surface of the streets into which they have been firmly trodden. For the past two summers I have had the principal thoroughfares washed twice a week, and the result has proved so beneficial that during the excessively hot weather of last summer I had not one single complaint. Such a system of street cleansing would be the most successful method applicable, as cleansing by water produces a perfect state of cleanliness, by the removal of all decomposing matter. "Failing this scheme, the only other method I can sug-

"Failing this scheme, the only other method I can suggest is by making provision in the streets for the reception of the sweepings during the wet weather, which is quite practicable. The quantity of slop or mud swept from the macadamized roads on a wet day averages in this district from four to five loads per mile. In certain streets, of course, the quantity to be removed would be greatly in excess of this; but these would be the exception. All that would be required, therefore, would be to construct in each street a receptacle of sufficient capacity to contain the slop swept from its surface, and as the quantity to be

DETAILS OF TWELFTH REGIMENT ARMORY, N. Y.

Digitized by Google

allowed for is small compared with the entire length of the street, this might be effected by a very simple arrangement—namely, the construction of a sufficient number of troughs in each street, at convenient distances apart, placed alongside the curb, and underneath the channel way into which the mud on the streets would be at once swept, and whence it could afterwards be carted. The great advanwhence it could afterwards be carted. The great advantage of this would be that in sloppy weather the whole of the mud and dirt swept from the surface of the streets would be immediately removed out of sight. The receptacles might be made fixed or movable as required, and constructed so as to present no unsightly appearance; in constructed so as to present no unsignity appearance; in fact, they would in appearance exactly resemble a length-ened street gully, except that provision would be made to prevent the entrance of storm-waters. In a thoroughfare like Park Lane, for instance, which on a wet day yields like Park Lane, for instance, which on a wet day yields about thirty loads of slop, thirty of these receptacles, placed at suitable intervals, each seven feet long by two feet wide and two feet deep, would be ample for the reception of the accumulated slop of the entire length of roadway. The contents would be removed in carts at leisure, either during the day or at night. Under existing arrangements the time occupied in filling a cart varies from twenty minutes to half an hour according to circumstances.

arrangements the time occupied in filling a cart varies from twenty minutes to half an hour according to circumstances. By the proposed arrangement a cart could easily be filled in half the shortest period now required.

"Failing both of these suggestions the only other alternative is to increase the number of horse-sweeping machines, and make it binding under heavy fines upon the contractor to remove the whole of the streets. A man with a ti is swept from the surface of the streets. A man with a broom will sweep about 3,000 square yards a day; a man

and horse with rotary sweeping-machine will sweep an area ten times as great—namely, say 30,000 yards.

"In addition to and in connection with either of these systems the erection of 'orderly bins' along the sides of the principal streets to collect the horse-dung and other matter which accumulates during the day would be of much use and greatly assist the work of cleansing.

much use and greatly assist the work of cleansing.

"In Paris the sweepings of the streets are not removed in carts as is the system here. There the London 'slop' cart is unknown, the refuse and mud is not permitted to remain on the surface of the streets, but is, with the aid of water, swept directly into specially-constructed sewers.

"The conclusions resulting from the foregoing may be recapitulated as follows:

"First—The work of repairing and maintaining the

be recapitulated as follows:

"First—The work of repairing and maintaining the parish roads would be more ecomically and efficiently performed by having ample accommodation for the storage of road material; by the employment of able-bodied laborers; and by discontinuing the use of macadam in all leading thereughlares thoroughfares.
"Second—Cleansing would be more rapidly effected by

such methods as the employment of hydrants, with receptacles for sweeping at the street sides; employing more horse sweeping-machines; obliging contractors to remove mud as swept up; increasing the number of parish horses and carts, etc., and discontinuing macadam in leading thoroughfares.

(To BE CONTINUED.)

REPORT OF THE MISSOURI RIVER COM-MISSION.

THIS report for the year ending June 30, 1886, contains among other things some valuable information as to methods of work; among the novelties being the introduction of steel tapes for accurate measurements, reported on by First Lieutenant Thomas A. Bingham and Assistant Engineer O. B. Wheeler. The mean probable error on a base line 9.712 feet long was I in 1,250,000. On another base 7,923 feet long the probable error was I in 140,000.

The adjusting apparatus for the use of the tape in measuring is also illustrated, together with its use, by photo-lithographs.

A standard gauge has been very successfully used for tide-gauge readings from bridges. It is arranged with a 14pound weight suspended by a steel wire cord, 1/8-inch in diameter, passing over a grooved sheave, which is attached by a lag-screw (on which it turns) to a track-stringer or other bridge timber. To the other end of the cord is attached a turnbuckle and lock-nut for taking up the stretch. A gauge-rod is attached horizontally to the stringer, with its zero properly adjusted, so that when the weight is lowered so as to touch the water the reading can be at once taken. This is reported on by Mr. A. H. Blaisdell, Assistant Engineer.

Mr. D. W. Willman, Assistant Engineer, reports on details of leveling and triangulation, organization of parties, method of fixing triangulation stations, and bench marks, etc.

The method used of leveling across rivers is described by means of which the results obtained are within a probable error of 0.0007 foot.

The Commission give details of successful work accomplished in stopping further caving of banks by the use of mattresses covered with stone. These reach 60 to 75 feet below low water and from 30 to 60 feet up the banks above it and seem to be permanent.

They outline their plans for the future, an I recommend an appropriation of \$1,000,000 annually. The design ation in the act of appropriation of a series of points where work must be done under a limited appropriation is justly criticised, as it is a simple waste of money to have a piece of work incomplete at the end of a season. The surveys of the river are still incomplete, some 2,000 miles remaining to be surveyed, which will require an expenditure of \$165,000 more.

Lieutenant Bingham also reports on the commerce of the river, and the great advantages to result from systematic improvement of the navigation. He makes the tollowing very pertinent observations:

"It is easy to see how by discriminations between local and through tariffs-added to the fact that the country along, or railroad, is to a great extent vassal to it-railroads can, by their combination, ruin the trade of a single highway. But it is not in these ways only that railroads have succeeded in practically suppressing the Missouri River traffic. The bridges are the obstacles to river trade.

"The advantage of a water route lies in the huge cargoes of barges that can be guided by one tow-boat. In a tortuous and swift stream, a large tow is difficult to handle at all times, but when the dangers are increased by a number of bridge-piers, not only blocking the highway, but giving rise to currents and eddies which not infrequently affect the river channel, the difficulties become so great that there are at present no barges run on the Missouri. Yet with the proposed channel of twelve feet barges could largely be used in spite of bridges." "The river can be so improved as to be permanently passable for huge fleets, and the saving (in freights) in one year would more than

pay for the improvements."

From the census of 1880 it is estimated that a saving to the producers of \$22,000,000 would be made for that one year by a properly improved river route, and this is more than twenty times the amount asked for by the commission for a year's expenditure.

Such figures as these are very suggestive, and it is only by constantly keeping them before the people that public sentiment can be educated to a proper appreciation of the immense benefit there is yet to accrue to the commerce of the country by a judicious expenditure in improving the waterways which Nature has so liberally provided.

"SIGNS IN THE HEAVENS."

AFTER listening to a recent sermon, entitled "Are Miracles Wrought Now?" it occurred to the writer that by means of a powerful stereopticon apparatus directed vertically upwards it might be possible on a dark night to cast a picture on low clouds that would be reasonably distinct to observers directly beneath it. Consultation with an expert in such matters has confirmed the impression of its possible feasibility, and the suggestion is given for what it may be worth.

It is hoped that nobody will mention this to the proprietors of washing compounds and patent medicines. It is bad enough to meet their advertisements at every turn on rocks, fences, and chimneys, but to walk out at night under a canopy of detergents and liver pills is a prospect too painful to contemplate.

MANY years ago, when the electric light was a new thing, it was exhibited on Boston Common, and pictures were thrown by it on the fountain in the Frog Pond, which were quite plain to observers on a line with the electric-light apparatus.

THE NEW YORK QUARANTINE ESTABLISH-MENT.

THE following is the report prepared by the Committee of the Academy of Medicine who were requested by Mayor Hewitt to make an investigation of the condition of the Quarantine Station of this port. This committee consisted of Dr. C. R. Agnew, Dr. E. G. Janewey, Dr. A. Jacobi, Dr. Richard H. Derby. The committee were accompanied by Dr. Herman M. Biggs, of the Carnegie Laboratory, Dr. Prudden, of the College of Physicians and Surgeons of this city, President James C. Bayles, of the New York Board of Health, and State Enginner Elnathan Sweet. They also secured the services of Mr. F. N. Owen, Mem. Am. Soc. C. E., to report upon the sanitary engineering features of the Station, and make suggestions regarding the necessary improvements.

Mayor Hewitt requested the committee "to make an early examination of the Quarantine establishment, to point out its defects and its requirements, in order to bring it up to the highest ideal standard of modern scien-

tific and medical knowledge; to estimate the amount which will be required to be appropriated by the State, in order to complete the necessary improvements, and gen. erally to suggest whether the city of New York should provide any further temporary hospitals in case there should be an outbreak of cholera in our midst." When the committee made its first visit to Quarantine, on Saturday, December 19, President Bayles, State Engineer Sweet, Dr. Biggs, of the Carnegie Laboratory, Dr. Prudden, of the College of Physicians and Surgeons, and Frederick N. Owen, engineer of Columbia College, accompanied them, and Drs. Biggs and Prudden were made members of the committee. The report is as follows:

"The first point reached in the explorations was Hoffman's Island. It should be remembered that the Quarantine establishment, port of New York, consists of the landing station at Clifton, Staten Island, where vessels arriving receive the official inspection of the Health Officer; and two miles below this station, in the Lower Bay, two islands, artificially made of rip-rap and sand filling. The more pothers of these islands called Hoffman in Bay, two islands, artificially made of rip-rap and sand filling. The more northen of these islands, called Hoffman, is dout two acres in extent; the more southern, near a mile distant from the former, is two across and one-half in size. Hoffman Island, in the system of Quarantine, is the place of detention. Off it detained vessels are anchored in the roadstead and exposed there to heavy seas when the wind is on the coast. To this island passengers and their hagging are taken from detained vessels by a when the wind is on the coast. To this island passengers and their baggage are taken from detained vessels by a small steam-tug when, in the opinion of the Health Officer, their detention is made necessary by prevalence among them of infectious diseases, or when such diseases

shall have existed on the ships in which they have arrived.
"The sick are sent immediately to Swinburne Island, to the hospital buildings which exist there.

to the hospital buildings which exist there.

"It is proper here to say that the Quarantine property, land, buildings, and plant generally owned by the State of New York, is in the custody of a body called the Commissioners of Quarantine appointed by the State and responsible to it. The Health Officer of the port, appointed by the Governor of the State and confirmed by its Senate, has no other control of the property and stations than that of police. He may use it without addition or modification, and so far only as may be necessary to enable him to discharge his duties in preventing the introduction into the port of New York of contagious diseases or infectious substances. In regard to the question whether Quarantine property and affairs should be under the jurisdiction of a National Government rather than a State Government as now, the committee is not called State Government as now, the committee is not called upon to express an opinion. The committee deems its business to be to point out such defects of the Quarantine establishment as are plainly apparent and easily remedied; to advocate such improvements in the plant at Quarantine as would render it a sufficient safeguard for the port of New York and the country at large if administered in a scientific manner.

As a related matter we would allude to the possible "As a related matter we would allude to the possible effect produced upon the business interests of New York and the country at large if cholera were permitted to invade the dense population of the city. It is estimated that \$100,000 a day is received by those hotels in the city of New York from which people would flee if an alarm of cholera existed here. The amount of money received over the counters of shops from those who frequent the city to have its innumerable wares cannot be estimated. It city to buy its innumerable wares cannot be estimated. It is millions. Hundreds of millions are annually produced in values in our various factories. To disturb the peace and industrial interests of the city by permitting the irruption of cholera through defects in quarantine would inflict an injury upon business beyond computation. The time consumed in reaching San Francisco by railroad is about that of the possible maximum period of incubation of cholera. The germs of any of the contagious diseases admitted into the port of New York by inadequate quaradmitted into the port of New York by inadequate quar-antine might be conveyed to any portion of the United States, fructifying as they went. Every citizen of the United States and British provinces has therefore a per-sonal interest in the condition of the New York quarantine. The existence of cholera in New York would cause the entire country to quarantine against the city. In this way inter-state commerce would be paralyzed or seriously embarrassed. As regards the effect upon the health and death-rate of the people we cannot even surmise, as that question would turn upon the efficiency of sanitary police. The law of cholera, its propagation, limitation, and extinction are so well understood that the disease may be said without presumption to be subject to scientific prevention or control.

With these few preliminary considerations your committee would now, in a cursory way, call attention to some of the manifest defects in the Quarantine establishsome of the manifest detects in the Quarantine establishment. In so doing they expect only to prepare the way for a thorough study of the subject. Thus steps may be taken to induce the Legislature, under appropriate law, to grant money enough to make Quarantine what it should be. The plans to do this should be speedily prepared by the State officers. If there is neglect in this matter and cholera, which has threatened to invade our port for more than three years and has recently been brought to Quarantine, should appear in the spring, and, favored by warm weather, pass an imperfect quarantine and reach New York City or Brooklyn, or possibly extend beyond to near or remote places, public opinion would seek out the blameworthy and visit them with a condemnation which no seclusion would be deep enough to smother or mitigate.

"The ground on Hoffman Island is soft, uneven, full of recesses in which water, refuse, etc., will be retained

of recesses in which water, refuse, etc., will be retained without any chance of their being cleaned. The wood walks are in the worst possible condition, interrupted, broken, rotten. The rip-rap of only one-half of the island is now supported by an inside wall of cement.

"The present buildings used for the residence of the people quarantined are hardly adapted for their purpose. They should be razed or remodeled.

"There is now almost no adequate separation of ages, sexes, or families. No suspected groups can now be isolated. There is no opportunity at all to separate those who may be amply able and willing to pay. There is no proper accommodation, bedsteads, bedding, tables, forks, knives, spoons, plates, or towels. As an evidence of the hardships caused by want of means of isolation a steamer is at present detained at Quarantine owing to the passengers and crew having been exposed to small-pox. They cannot and crew having been exposed to small-pox. They cannot be taken to the island, as there is no subdivision of the hospital of observation.

"The supply of water is insufficient, and warm water is almost entirely wanting.
"For a population now there of more than five hundred persons there are about four water-closets, each closet having three or four hoppers, some of which are not flushed at all, and all of which are old, badly constructed, and out of reposit and out of repair.

and out of repair.

"The cleaning and disinfecting plant is entirely inadequate in extent and efficiency, thus making it impossible to cleanse the persons of the quarantined or disinfect their luggage, either expeditiously or thoroughly.

"The 'sulphur-room' should not be where it is and as it

is; for, being on the main floor of a building occupied by masses of the quarantined, the latter are constantly exposed to fresh infection from clothing brought in to be disinfected and to the fumes of sulphurous acid when the door of the sulphur-room is opened.

"The island must be protected against the inroads of the sea. This may be done as may seem best to the State the sea.

Engineer:

-The rip-rap wall extending around the island should be made smooth and even to the water's edge.

"Second—The concrete wall, extending at present only part way around the island and inside the rip-rap, should

Third—A solid wall of masonry, with smooth surface and steeply sloping, should be laid on the face of rough stones, either on the line of or within the existing rip-rap.

"Fourth—A low wall might be built within the rip-rap, capped with stone or granite curbing, on which a broad walk should be constructed around the island.

"An iron fence on the outer edge of the wall should extend entirely around the island, in order, first, to separate the occupants of the island from the rip-rap, and, second, to prevent access of strangers to the island.

The surface of the island should be cemented or asphalted, and should be raised sufficiently above the exterior wall to allow of good drainage. It should be smooth and hard to allow of thorough cleansing and prevent

the lodgment of filth or germs.

The docks should be reconstruced and two in number the floorings made non-absorbent with concrete or asphalt.

One should be for general use and the other exclusive for the disenfectant plant. A covered landing stage should be constructed on the former, from which the sick in stretchers could be transferred to boats. A covered way should be provided from this dock to the large buildings and hospitals. It would be well to have a hand car, rails to be laid from the dock to the buildings.

"The surface of the island outside of buildings should

be divided by a wall or iron fence into two distinct

portions:
"A.—The part adjacent to the boat landing should be A.—I he part adjacent to the boat landing should be used for disembarking, disinfection, etc., and on this should be placed the cook-room and dormitory for employees and all other administrative appurtenances.

"B.—The remainder of the island should be divided by

walls into approximately equal areas, corresponding to the groups of people, each with a water front, and each one of these areas should be in communication with one only of the sets of apartments occupied by the separate

groups of people.

"It would be advisable to separate each of these yards from the water front by an open iron fence so as to leave a walk of about 10 feet in breadth around the island exclusive of the administration area. There should be on the outer or sea side of this wall another iron fence around

"The present administration building, if retained, and one of the largest buildings must be remodeled to answer for a new administration building, a disinfecting building and a storehouse.

If the present large buildings are to remain the roof should be repaired; each main floor should be subdivided into two or more portions by solid partitions to allow the into two or more portions by solid partitions to allow the grouping of the inmates according to age, sex, and relationship; each apartment should have a separate entrance and be thoroughly ventilated. This method should be condemned, however, unless absolutely unavoidable, as poorly-ventilated apartments would result. The best plan, and in the only soliton. and, in the opinion of the committee, the only sanitary one, would be to construct new fire and filth proof buildone, would be to construct new hre and hith proof buildings, tearing down the old ones as speedily as possible; or, if need be, one at a time.

"The present administration building should be remodeled or a new one erected. It should contain the medical

officer's apartment (who should also be superintendent) and quarters for an engineer, and with private kitchen;

also an extension in one of the docks, with a furnace suitable for burning actually infected articles brought in by passengers, kitchen refuse, etc.

passengers, kitchen refuse, etc.
"Separated from these apartments there should be a large kitchen, with accommodations for cooking meals for 800 or 1,000 persons; rooms for the attendants; boilerroom containing at least two boilers for adequate power and security in case of accident to one; engine, pumps, and apparatus for electric lighting; the sleeping and living rooms for the employees, with three rooms for the resident physician, may be placed in a separate building.

"There should be a small isolated building, easy of access to the dock, where persons taken suddenly ill could be at once placed prior to their removal to Swinburne Island. It should contain at least four rooms to admit of

the separation of the sexes and of diseases.

"The main buildings should be on the pavilion plan, of brick and iron, with two stories. Each should have a central hall, from which wings should radiate at right angles. These wings should constitute rooms capable of giving 500 cubic feet of air to each adult or every two children, and of a size to accommodate twenty-five per-

sons, with an extreme capacity of forty or fifty.

"A separate set of rooms should be provided for cabin passengers and those who could pay for better accommodations. [Here follow ordinary recommendations as to isolation of classes, construction of walls and floor in nonabsorbent materials. cellar ventilation, drainage, water-closets, lavatories, laundry, furniture, table utensils, meals, temporary suits of clothing to be used by emigrants while clothes are being disinfected, and towels.]

"The disinfecting plant should be situated in a separate building near the water's edge. The plant should consist of two or more large iron chambers lined with steam-pipes connected with a superheater, so that a dry temperature of at least 220° could be easily obtained. It should be arranged so that moist steam under fifteen or twenty pounds pressure could be introduced. The room in which the chambers are placed should be divided by a non-absorbent partition, and the materials to be disinfected should be separated at one end and removed from the other, this handling to be done by separate people. [Storage warehouses and the water-supply here received

attention.]

"It would be wise to fill up the present cisterns and construct new ones. * * * It would be well to provide for an emergency by having a large reservoir to which water could be brought in case of emergency. Water for drinking and cooking might be brought by boat from Croton supply. [Amusements, the advisability of having a skilled resident medical officer as Superintendent, etc., are here treated. Then, the recommendations are turned to Swinburne Island, where improvements are suggested in the approach from Hoffman Island; in the number and accommodation for attendants; in the height and ventila-tion of the pavilions; the water-closets; the means of disinfection, which should be similar to those recommended for Hoffman Island; in the morgue and in the means of disposing of bodies of the dead. All the buildings on both

islands should be fire-proof.]

"His Honor the Mayor wishes the committee to estimate the amount which will be required to be appropriated by the State in order to complete the necessary arrangements. * * To comply fully with the request, the ments. * * * To comply fully with the request, the committee would say that a commission should be formed, to consist of the State Engineer, the Superintendent of Public Works, the Mayor of the city of New York, the Mayor of Brooklyn, a representative from the New York Board of Health, the Health Officer of the Port, and the Commissioners of Quarantine."

Civil and Sanitary Engineer Frederick N. Owen recommends improvements in the line of the foregoing report.

Mayor Hewitt, after digesting the report of the committee, sent the following communication to Governor Hill on the subject :

MAYOR'S OFFICE, NEW YORK, December 31, 1887. To the Governor :

SIR: As you are aware, during the last summer and fall several ships arrived in this port from the Kingdom of Italy on which cholera cases were found to exist. Naturally very great apprehension of danger was excited in the public mind, and the quarantine arrangements of this port became the subject of much anxiety and some examination. A committee of the College of Physicians of Philadelphia made a very careful investigation of the provisions under the control of the Commissioners of Quarantine for preventing the spread of contagious dis-The report of this committee was so unvavorable that I deemed it to be my duty to ask the Board of Health of this city to prosecute the investigation and to invite a committee of the New York Academy of Medicine to make a thorough examination of the Quarantine establishment. This duty has been performed by Drs. C. B. Agnew, E. G. Janeway, Stephen Smith, A. Jacobi, T. Mitchell Prudden, Herman M. Biggs, and Richard H. Darby, physicians well known in the profession, and some of them specialists of great distinction.

I have now the honor to transmit herewith the report of this committee, with the accompanying documents. It discloses a condition of affairs which calls for the immediate action of the Legislature. It is evident that neither this city, nor the State, nor any other portions of the Union, are free from the dangers of the spread of contagious diseases, unless the Quarantine establishment at this port, under the control of the State authorities, is at

once reformed and reconstructed. The danger of delay is too imminent to admit of any postponement whatever have, therefore, the honor to request that you will transmit this report to the Legislature and recommend such action as will secure adequate provision against the dangers of contagious diseases which will be liable to break out as contagious diseases which will be liable to break out as soon as the warm weather approaches. It is not proper for me, as Mayor of this city, to suggest the mode of procedure which the State ought to take in reference to this pressing demand for the removal of the danger in our midst, but if, in the wisdom of the Legislature, a commission shall be formed to rebuild the establishment so as to bring it up to the highest ideal standard of modern scientification. tific and medical knowledge, I can assure you of the co-operation of the city authorities, and particularly of the medical profession, who have shown themselves to be fully alive to the dangers of the situation, which cannot be exaggerated. I have the honor to be, very respectfully, your obedient servant,

ABRAM S. HEWITT, Mayor.

THE ENGINEER'S RECOMMENDATIONS. REPORT OF F. N. OWEN.

Hoffman Island.—I. Removal of all timbering and the rip-rap breakwater to the level of low water of spring tides; on the foundation thus made to erect a concrete sea-wall the entire circumference of the island.

2. Remove the present defective docks and construct a

single pier on the channel side of the island of sufficient length to allow the quarantine boat to reach it at all stages of the tide.

The thorough disinfection of sewage before it passes

4. The removal of the present "barracks" and the construction of suitable buildings provided with the most approved means of ventilation, heating, drainage, etc.

5. The buildings should be lighted at night by elec-

5. The pullulings state tricity.
6. Water-closets and lavatories should be in semi-de-

7. Water should be supplied in great abundance, either a pipe under the bay from Staten Island; by a driven well on the island, or by large elevated storage-tanks sup-

8. An isolated building should be built for disinfection. both by steam and sulphur, and so arranged as to effect-ually separate the infected from the disinfected articles.

9. The entire surface of the island should be paved with either asphalt or concrete.

Swinburne Island.—I. A dock should be built on the channel side of the island so that the quarantine boat may

reach it at all stages of the tide.

2. The hospitals should be raised sufficiently to allow the free circulation of air beneath them.

3. Adequate means for the proper heating and thorough ventilation of the various wards should be provided.

THE DIFFERENT VARIETIES OF THUNDER-STORMS, AND A SCHEME FOR THEIR SYSTEMATIC OBSERVATION.*

BY THE HON, R. ABERCROMBY.

THE author shows that there are at least three distinct types of thunder-storm in Great Britain. The first, or squall thunder-storms, are simply squalls associated with thunder and lightning, which fly nearly with the surface of the wind. These form on the sides of primary cyclones. The second, or secondary thunder-storms, are associated with secondary cyclones. These move against the surface of the wind and are very rarely accompanied by squalls. Very little is known of the nature of these squalls, though they are the commonest type of thunder-storms in Great Britain. The third, or line thunder-storms, are apparently of a totally different nature. They take the form of long, narrow bands of rain and thunder, perhaps 100 miles long and only five or ten broad. They cross the country rapidly nearly broadside on. These are usually preceded by a very violent squall. The squall which capsized the 'Eurydice" was of this type. The air in thunder storms seems to circulate round a long horizontal axis, which would lie in the direction of the thunder-storm instead of round a short and nearly vertical axis, as in cyclones. The outline is given of a proposed scheme for the systematic observation of thunder-storms in England, by which it is hoped that the mechanical nature of the circulation of the air in every kind of thunder-storm may be discovered. It is also shown that if that particular kind of thunderstorm which is not associated with any distortion of isobaric lines can be worked out, a kind of rain could then be successfully forecast which is now very rarely announced. Forecasters now have to depend almost exclusively on synoptic charts of isobaric lines. To this extent they fail; but it is hoped that observations in the form and motion of clouds may be found to indicate the approach of rain when the barometer shows nothing.

* Abstract of a paper read before the British Association Meeting st Manchester, September, 1887, and published in the Electrician.

SOME DETAILS OF WATER-WORKS CONSTRUCTION.

No. VI.

(Continued from page 23.)

BY WILLIAM R. BILLINGS, C. E., Superintendent of Water-Works, Taunton, Mass. SERVICE-PIPE.

By common consent and general usage, the term servicepipe is applied to the tube which conveys water from the street-main to the premises on which it is to be used. In the majority of cases the service-pipe proper ends just inside the cellar wall, and the term house-pipes is a suitable one to apply to the tubes which convey the water from that

point to the various fixtures in the building.

There seems to be substantial agreement among those best qualified to judge that lead is the most suitable material for service-pipes, but in spite of this the first cost of lead pipe and the popular prejudice which is often found against it has prevented its adoption in many recently constructed works. This is not the place for a thorough discussion of the subject, but those who care to follow it are referred to a paper by Mr. Walter H. Richards, C. E., Engineer and Superintendent of the New London, Conn., Water-Works, which was published in the transactions of the New England Water-Works Association for 1884, and to Professor Nichols' "Water-Supply from a Chemical Standpoint."

Lead pipe is to be preferred because it is the most durable, the most easily worked, and the smoothest pipe now in the market. Its substitutes are plain wrought iron, tarred or enameled wrought iron, galvanized iron, and wrought iron lined with cement.

One's choice really lies then between lead pipe and

the question as to its healthfulness, leaving only the question of cost to be considered, and upon this latter point Mr. Richards' paper referred to gives some interesting figures.

TAPPING.

Except for special reason, a main should not be tapped for service-pipes until it has been filled, and, better still, if possible, not until it has been thoroughly flushed.

Cast-iron pipes must be entered by means of some sort of tapping-machine. There are several machines for this work upon the market, and one will not make a mistake in buying any one of them, provided it is offered by trustworthy parties. It is well to bear in mind, in selecting a machine, that it is to be carried about, and perhaps knocked about; that it is to be used in all sorts of trenches. wet and dry, muddy, sandy, and rocky, and, therefore, that it should be light, strong, simple, and with as few wearing parts to collect sand and grit as possible. It will be well for any man who taps a pipe under pressure for the first time to choose, if he can, a section which can be easily shut off, for it will be nothing strange if he has to shut down and take off the machine to get the cock into the pipe. Printed directions for operating are furnished with each machine, and a week's work will make one independent of them.

That which is screwed, soldered, or driven into the main pipe is the corporation cock; at the sidewalk we have the curb or sidewalk cock, and just inside the cellar wall should be placed the house shut-off, or stop and waste cock.

In the early days of the Boston Water-Works sidewalk cocks were not used, and to shut off the premises wholly from the main the Water Department was obliged to dig

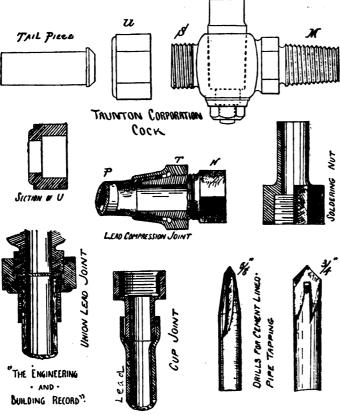

FIGURE 20.

wrought-iron pipe with some protecting coating. Tinlined lead pipe is not, to the writer's way of thinking, worthy of much consideration. The tin lining is thin and easily broken in working, and if the lead be exposed at any point the chance for some galvanic action, followed by the formation of lead carbonate or lead oxide, is too great to be taken. If any combination of chemical and physical reasons in some special case should render lead pipe unadvisable, a perfect though expensive substitute may be found in pure block-tin pipe.

The experience of every city and town which uses lead for service-pipe is, so far as I can learn, that a thin brownish insoluble coating soon forms on the interior walls of the pipe, and then all further action ceases. The cities of New York, Philadelphia and Boston; Worcester, New Bedford, Fall River, in Mass.; Denver, Col.; Atlanta, Geo.; Chicago, Ill.; Wilmington, N. C., to go no further in this country, and Glasgow and Manchester abroad, use lead pipe, and this consideration would seem to dispose of

down to the corporation cock. This condition of things was unsatisfactory, and, under the direction of Assistant Engineer Brackett, sidewalk cocks are being inserted.

As to the house shut-off just inside the cellar wall, there seems to be no good reason why the Water Department, or the water company, should furnish that, except to secure uniformity and a first-class fixture. That there should be a good, sound, easy working shut-off cock at that point there is no sort of doubt, but who should furnish it may be left as an open question. In Taunton it is furnished by the consumer.

Referring to Fig. 20, which represents the particular pattern of corporation cock, with full 3/4-inch way, designed by the writer for use upon the Taunton Water-Works, the end M is the end which is screwed into the main. The general form of this end is the same no matter what is used for service pipe. Something is saved in the cost of manufacture by using the same thread at S and M. Eleven, twelve, fourteen, or sixteen threads to

the inch are admissible, but fourteen has been found to give good results in the practice of the writer. At the end S and in the parts immediately following there is room for great variation in form and method. With the nut u (shown also in section) and the tail-piece forming a ground union joint at the end S, this form of cock may be used (1), with lead service-pipe by making a wiped joint or a cup-joint between the lead pipe and the tail-piece; or (2), with any kind of wrought-iron service-pipe by joining on to the tail-piece a short piece of lead pipe, perhaps 18 inches, just as if the service were to be of lead pipe, and then, by attaching a soldering nut, as shown, and continuing the line with screw-joint pipe.

There is a form of corporation cock in the market in which the end S has a female connection so that wrought-iron pipe may be screwed directly to the cock without the intervention of lead pipe, but this form cannot be recommended for general use, because the flexibility of lead pipe is needed to insure safety against overstraining from settlement in the trench.

In addition to the joints made with lead pipe by wiping or cupping, there is one which may be called the compression-joint. Some regard this joint as to be preferred to any joint which depends upon solder, but the writer's experience does not lead him to take this view of it.

The compression-joint was in use a few years ago in Taunton, but was abandoned for a cup-joint. The corporation-cock then in use was shaped at the end S like the projecting part of N in the compression-joint shown in Fig. 20, and tightness was secured by scraping the outside of the lead pipe to a reasonably smooth surface, so that the cone-shaped nut would draw the lead pipe firmly over the conical projection; the lead pipe having been first spread by driving in a solid plug.

It is evident that this principle can be applied in a variety of ways, and that castings can be designed to fix any combination of materials. For example, the cup joint in Fig. 20 shows how a wrought-iron service-pipe may be joined to a lead connection from the corporation-cock. The lead pipe is attached by a wiped or cup joint to the soldering nut, which is tapped out to receive any size of wrought iron or brass pipe that one chooses.

Still another form of joint has been brought to my attention, by Mr. J. G. Briggs, Superintendent of Water-Works at Terre Haute, Ind., and shown also in Fig. 20, as a union lead joint. Mr. Briggs says the idea is not a new one, but was used twenty years ago or more by an English company who did a large amount of work at Rio Janeiro, Brazil, and that in San Francisco the joint has been used for sixteen years with good results. The lead pipe is put through the brass thimble, and the end hammered or riveted over on a pin made for the purpose, and tightness secured by a washer. If this washer be of lead it will last, but it would seem as though a leather or a rubber washer would be too short-lived to be wholly satisfactory. As to the merits of this joint the writer has no practical knowledge, but the fact that Mr. Briggs favors it would, in the vernacular of the stock market, be counted as a "bull point" for it.

(To be continued.)

FLASH-SIGNALING ON THE CLOUDS.

In the *Electrician* of December 2 is described an experiment on cloud signaling at Singapore between two vessels of the British Navy some sixty miles from each other. Flashes of varying duration and interval forming the letters of the alphabet according to the Morse system were thrown upon the clouds by an electric light. The message was received correctly, but the reply was not intelligible. Though the experiment was only partially successful, it suggests important possibilities, although obviously limited by the necessity of favorable atmospheric conditions, a dark night and low clouds being essential. It is really a sort of artificial "heat lightning."

M. Ducretet has made an important improvement in this method of signaling by an apparatus which automatically records the signals that have been given.

We believe that by means of the heliotrope the Morse signals can be flashed by reflected sunlight to an equal or greater distance from one mountain peak to another, and that this method has frequently been used by our army officers in their Indian campaigns, and also to give "sights" in trigonometrical surveys.

HOT-WATER HEATING APPARATUS IN A SMALL BRICK HOUSE IN BROOKLYN.

THE following communication from "Thermus," describing a piece of work, will be found of interest:

SIR: I herein describe an experimental hot-water apparatus fitted in the most simple manner in one of the numerous small brick houses intended for one family now being built in New York and vicinity. These are now a feature of immense districts of Brooklyn, N. Y. These houses rent from \$300 to \$450 a year, according to circumstances and location, and are the homes of many thousands of small business men, professional men, and clerks who do business in New York and vicinity, and who thus have accommodations in pretty brick or brownstone-front houses, all to themselves, who would be forced to live in apartment-houses in New York at greatly advanced rents.

The drawback to these houses, however, is their method of heating. They are, almost without exception, warmed (?) with a fire-place heater in the dining-room, with a flue to the parlor and front bedroom. During the cold weather people are either forced to freeze or be suffocated with the nondescript half-furnace, half-stove that warms the dining-room and sends gas, ashes, and dust to the upper floors, as not one in twenty of these fire-place heaters are in order during the second winter, and whether they are in order or not the houses cannot be warmed by them in ordinary cold weather. Such, however, is the writer's experience with two different ones, and it seems to be the experience of his neighbors. If much air is allowed to go upstairs from the heater in the dining-room, the draught along the dining-room floor towards the heater keeps one cold. No air is admitted from out of doors, so the advantage of fresh air cannot be claimed for them; they depend on the return of the air down the stairways for a supply to keep up the circulation.

Almost invariably, however, the leakage of gas is from the heater into the air-flues of the house. A 3-inch smokepipe is run up within the principal air-flue, and when the air-flue draws better than the chimney and smoke-pipe the inhabitants keep warm on a mixture of warm air and coalgas, especially when the damper in the pipe is shut, which is the invariable rule at night, to save coal, by those who follow the instructions of the makers. Fortunately, this 3-inch damper has a 1-inch hole in its centre "to carry off the gas," and, therefore, people do not die suddenly from coal-gas poisoning, but of the impairment of health from this cause there is no doubt in the judgment of any intelligent person who has investigated it.

To escape this state of affairs the writer put up the apparatus shown here, and is now using it the second winter with a satisfaction that is beyond comparison. There is no patent on it and its cost is trifling, which will be given in detail hereafter. The radiators and boiler used by the writer are, presumably, patented by the maker, but as any hot-water boiler of the half-dozen good ones now before the public can be used, and flat coils of 1-inch pipe or any hot-water radiator can be placed in the rooms, it comes to the same thing; as the principle of piping is old and is the property of any one who wishes to use it.

In this case a No. 22 Hitchings hot-water base-burning boiler was used and placed in the corner of the dining-room at B. It looks like a base-burning stove and takes up no more room. The object of the position was two-fold. It warmed the dining-room and brought the boiler very near the basement door so ashes, etc., could be quickly removed to the area under stoop, the usual receptacle for it in these houses. The only objection to this position is the length of the stove-pipe as the houses are now built. In the summer, however, this is taken away, and in the winter (with all the heat that comes from a fire in a hot water boiler) a Russia iron pipe five inches in diameter is not very objectionable. In fact, to the man who had to wear his overcoat at breaktast when he depended on his Baltimore heater it is most welcome.

From this little boiler, that has about fifteen square feet of fire surface in it, there is carried a 1½-inch flow-pipe to within six inches of the ceiling. Just below the elbow there is taken the flow or supply pipe for the parlor radiator, plainly shown in the diagram, Fig. 1, which diagram is an exact reproduction of every bit of pipe in the house, and, to a practical man, shows all there is to be seen. For the unpractical, however, I will explain further. After supplying radiator No. 1, the 1½-inch main passes into the hall, or just through the partition. From there it is carried straight to the rear wall of house, through the basement

hall and kitchen, reducing to 1¼ inches in size after the !hird heater is taken off, and thence carried 1¼ inches to the end or fourth heater. This main rises all the way to the last heater, there being about 3 inches rise in its whole length. The return-pipe is an exact reproduction of the flow-pipe, and is set side by side with it, the only difference being in where it enters the boiler—at the bottom. The radiators are all of the same size with an angle-valve to the inlet end of each. They are nominally 25 square feet of surface each, being single-row Bundy hot-water loops, regular height, 10 long, taken at 3½ square feet of the loop, making, in all four, 140 square feet of surface, which has proved itself ample to warm the house when taken in addition with the mains and boiler.

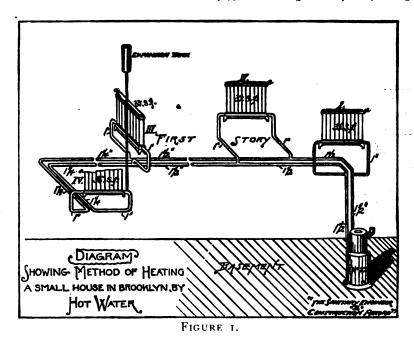

The upper or bedroom floor requires no heaters. Sufficient heat escapes from the parlor floor to keep it warm.

A difference of about twelve degrees exist, between the temperature of the flow and return pipe between where the one flows out of the boiler and the other enters it.

The cost of such an apparatus is as follows:

The boiler, or one of equal power, can be purchased	
and delivered for about	\$50
140 square feet of good hot-water radiator will cost	
about 40 cents per square foot	56
The cost of mains is about \$16	16
Four days' labor, man and helper, \$7.50	30
Smoke-pipe and zinc	5
One thermometer on flow-pipe at boiler	3
Galvanized sheet-iron expansion tank and sundries	5
	\$165

This is the actual cost, and does not allow for profit for a pipe-fitter. If, however, the consumer takes the builder's risk and contracts for labor, he can keep his cost down to \$175, unless things are very badly managed. THERMUS.

In the coldest weather, with water at 170° Fah., the windows on the upper floors can be kept open an inch or two, and, ordinarily, a temperature of 150° Fah. in the pipes keeps the house warm and comfortable, and allows for opening the windows, as above, for a change of air. The apparrtus runs day and night, and a varation of ten degrees is never experienced.

The average consumption of hard coal is less than 50 pounds per day; a ton a month more than doing for all purposes. With the old heater a ton would last not quite twenty days for all purposes.

The houses are in blocks, thirty such houses being in the block this one is in. The end houses would require a more ample apparatus, as they have more windows and a greater outside wall area; for the centre ones, however, the apparatus described here is ample.

The sizes of windows are marked on the plans, Fig. 2, and also the sizes of the rooms.

THE EXPLOSION AT THE EQUITABLE GASWORKS.

THE cause of this disaster, which occurred on New Year's eve and has been fully described in the daily press, has not yet been satisfactorily ascertained, but the dynamite theory at first advanced has been entirely abandoned.

REGARDING THE MAKING OF LEAD BENDS. MILWAUKEE, WIS., December 27, 1887.

SIR: As winter approaches, notwithstanding the jokes of the daily press, the plumbers do not feel exuberant over the prospect of a fortune to be made by thawing and repairing bursted water-pipes. One way to keep the men out of mischief in the long winter days is to make lead bends. The days of "hand-made" traps are over, but as a great many 11/2 and 2 inch lead bends are used by plumbers, it would be profitable to make them. Make a block of wood 2 inches thick, 7 inches long, and 5 inches wide, in this shape, and screw it to the bench. On the right of this piece, and 21/2 inches away, screw on a piece of block 2 inches thick, 7 inches long, and 2 inches wide. Now take a piece of 1½ or 2 inch light lead waste-pipe,

and plug it tightly at one end with a wooden plug, fill it with hot sand, and plug the other end the same way. Some plumbers dress one end in and solder up the point, and after filling the pipe with hot sand, they solder a piece of sheet-lead across the other end, and leave a small air-hole in the centre, which is soldered up the last thing.

The length of the piece of waste-pipe is immaterial, but two feet long is the easiest to handle.

Heat the part to be bent over the blast-furnace so that it is nearly ready to melt and place it between the two blocks. Then bend it around the curve of the block and by using a dresser a perfect bend can be made.

The bends can be made up for overflows to baths and basins and kept in stock. The bends we buy cost us from 40 to 50 cents each, and a good plumber can earn his wages in the winter days making these bends. It is worth a trial at all events. W. G. NICHOLSON.

MASTER PLUMBERS' ASSOCIATION OF BOSTON.

BOSTON, January 2, 1888.

THE meetings of the Master Plumbers' Association are now held on the second and fourth Thursdays of the month, at Elks' Hall, No. 24 Haywood Place. Yours truly,

FRANK A. TITUS, Corresponding Secretary.

PHILADELPHIA TRADE SCHOOLS.

(Special Correspondence.)

PHILADELPHIA, January 3, 1888.

THE Trade School Committee of the Master Plumbers' Association of Philadelphia have determined to open the school connected with the association on January to, for a term of three months, and have prepared a circular of which the following are extracts:

The Trade School under the auspices of the Master Plumbers' Association of the city of Philadelphia will be opened for the season on January 10, 1858. There will be instruction two evenings each week; on Tuesdays, drawing; Fridays, shop practice.

The shop practice will consist of:

- (1) Copper-bit work, tinning of metals.
- (2) Making straight joints.
- (3) Branch-joints.
- (4) Upright joints.
- (5) 2, 3, and 4 inch round and flange joints.
- (6) Cup-joints and seams on sheet-lead.
- (7) Lining tank (copper and lead).
- (8) Making service-boxes and lead traps.
- (9) Calking or making joints on iron pipe.

(10) Rigging hydrants.

Blackboard illustrations of the manner of setting and fitting up plumbing fixtures.

Mental exercises in the nature of questions and answers on :

- (1) The proper arrangement of drains, soil, and waste pipes.
- (2) Trapping and ventilating of drains, soil, and waste pipes.

(3) Cold-water supply-pipes.

The lessons in drawing will consist of instruction in the elements of drawing adapted to the forms of various size of pipes, bends, branches, Y's, T's, etc., as applied to the plumbing of private and public buildings with a view to obtaining proper and effective drainage, showing the principles of syphonage, a proper understanding of which is essential.

Improperly arranged plumbing plans will be given the class for correction in order that they may understand the subject.

Only employees of members of the Master Plumbers' Association will be admitted as pupils. The charges for instruction, including the tools and materials, will be \$3 per term of three months, and applicants must have certificate of appplication signed by their employer.

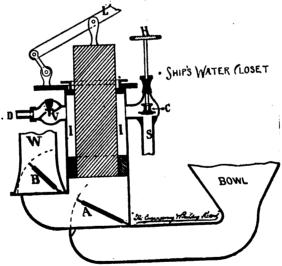

OPERATION OF A SHIP'S WATER-CLOSET DISCHARGING BELOW WATER-LINE.

SIR: Will you explain the working of water-closets which on ships are often situated below the water-line? And oblige,

REPLYING to inquiry of method of arranging waterclosets on ship-board below water-line, we give a working diagram of a closet manufactured by A. B. Sands, of this city, intended for use on yachts, pilot-boats, etc., either above or below the water-line.

Whenever used, the piston is operated by the handlever L. The down stroke creates suction in upper part of chamber I I, closes the valve V, and draws water through 34-inch supply pipe S.

At the up stroke of the piston, valve C closes and valve V opens, and the water in the chamber is forced through discharge-pipe D, which carries it around and flushes the bowl.

At the same time suction is created in the lower part of chamber II, closes valve B, opens A, and draws the soil into the lower part of the chamber. The next down stroke repeats the flushing operation, closes valve A, opens B, and forces the soil up the pipe W and thus discharges it into the sea below the water-line. Repeated strokes will be required to discharge W if its outlet is much above the closet.

The top of chamber I I, bottom of piston, and valve-

rod H are well packed.

C is simply an adjustable check valve to control supply of flush-water, the proper regulation of which greatly facilitates the easy working of the closet, and for this reason the piston is made so large as to greatly reduce the annular space between it and the walls of the chamber.

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

RAPID TRANSIT IN NEW YORK.

SIR: Referring to the communication from an engineer incorporated into your editorial of December 24,

Rapid-Transit Problem in New York," in which he says "one has only to use the London underground," I wish to suggest that the discomforts of the London underground may be no arguments against a New York underground, any more than the fact that on roads costing over \$200,000 per mile in England, a passenger does not ride with the comfort attained on a \$15,000 to \$20 000 road in this country, and pays more for his ride, unless he rides third class, is an argument against our railioads.

There they warm (?) their cars with a hot-water instru-

ment of torture, which makes you wish to put your feet out of the window for coolness during the first hour of your journey and wrap them up in any heat-retaining rug to keep them from freezing for the last hour. And they stop their trains to collect fares! and get run into for their

These are the most costly roads in the world, which are supposed to be the best. They exact between two and three cents per ten mile for freight, and though their engines cost a little more in the first place and quite as much for repairs, they pay less wages by nearly one-half than we, who collected only a fraction over one cent per ton mile on all the freight carried in the United States during 1886.

We may have as inconvenient, costly and bad-smelling an underground railroad in this city as they have in London. Yet I will believe it when I see it.

Please allow me to submit, even though you are advo-cating a road through the blocks on solid masonry, that cating a road through the blocks on solid masonry, that while a road is built for the convenience of its patrons, the people who build it look for interest on the capital invested. This consideration should never be absent from the mind of the engineer entrusted with the design and execution of the work, unless it is a work which, like the smoking of a cigar, is not expected to add to the world's utility. The chattering arrangement now standing in the Sixth and other avenues of this city was cheap enough—to the directors—to probably afford an ample compensation from fares at three cents each. But no one, except those who wish for the profits of building, wish to see any more such structures, and the choice seems to lie between the plans you have advocated and an seems to lie between the plans you have advocated and an Arcade or underground road.

No one can doubt that a solidly built road through the blocks would be more pleasant to ride on than one under Broadway, but the last would carry as many passengers, and probably leave half of the capital required for the better road, free to enter other enterprises; hence, an arcade road through Broadway, which did not have to buy its right of way, could carry passengers cheaper than a road built through the blocks, though it might happen that the only difference would be that the capital invested in the one would earn more than that invested in the

[Passenger carrying capacity is not the only consideration.—ED.]

CAST-IRON PIPES USED FOR MAIN SEWERING AND HOUSE-DRAINING.

LONDON, December 15, 1887.

SIR: The question has been put to me by some of your municipal engineers as to my opinions of the probable endurance of cast-iron pipes when used as sewers and drains. My answer in brief is that "I do not know," as, though I have an experience of thirty years, the pipes used by me are as sound now, apparently, as the day when they were first laid down.

The conditions to be observed are: A full and perfect coating of the cast-iron pipes, when fresh from the foundry, with the black varnish patented by the late Dr. Robert Angus Smith. Let the varnishing be done at the proper time, in the proper manner, and with the proper varnish, and the endurance will most certainly be far beyond my experience. I have seen pipes taken up which had been in the ground thirty years and the varnished skin of the pipe was clean as on the day it was laid. This was the external portion. The inner portion of a pipe may be incrusted by deposit, and if acids are turned in from brass foundries, tin-works, and zinc-works, the pipes may be injured, but I have not as yet seen pipes so injured.

R. RAWLINSON.

SIR ROBERT RAWLINSON ON SMALL PIPE SEWER SYSTEMS.

New York, January 1, 1888.

SIR: I have recently received a very kind letter from Sir Robert Rawlinson. In it he volunteers his opinion on a number of points in connection with sewerage. Thinking that it might also be interesting to your readers, I quote the following. RUDOLPH HERING.

"No drain from any house should be less than six inches in diameter. No sewer in a street should be less than nine inches. All junctions of sewers with the main should be entered at the level of the top rather than at the invert, so that the entering sewers and drains shall not be back-watered by the flow in the main. It is more difficult safely to sewer and drain steep gradients than flat gradi-

ents, because sewage-gases will flow upwards as sewage gravitates downward, and the upper part of a town will be flooded by sewage-gases from below. All steep gradients should be broken by ramps, having special means for ventilation, and the upper ends of all steep sewers should have full ventilation equal to the diameter of the sewer."

"Sewers and drains should be so constructed as to unceasingly pass fresh sewage out without leaving deposit. The most sluggish flow should not be less than one mile per hour, and with sewers true in line, in form, in grade, and well flushed, this may be accomplished, especially if subsoil water is taken in to a limited extent. The worst sewer to manage is one laid on a dry subsoil of sand or gravel, and the sewer leaking. In such sewers deposit will be found. Every dry sewer-trench should therefore be made water-tight before the sewer is laid in, or the sewer will be foul."

"I have sewered towns in England having from 10,000 to 40,000 inhabitants where the entire population is supplied with water-closets, and there is a flow of subsoilwater in the sewers. Every particle of human excreta is at the outlet within the day, the flow from 12 o'clock at night to 6 o'clock in the morning being clean water."

"P. S.—With the end of this year—after 40 years—I end my Government service."

ON THE LOCATION OF TRAP VENT-PIPES. New York, January 4, 1888.

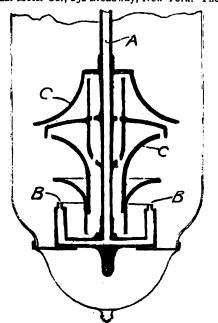

SIR: In reference to the question of location of a ventpipe on trap, as brought up by correspondence in a recent
issue of THE ENGINEERING AND BUILDING RECORD—
viz.: as to whether vent is proper on crown of trap or some
six inches beyond, more or less, as the different situations
call for—my belief is, the proper place is on crown of
trap. I have heard it said that there was an objection to
this, owing to the water splashing up in said vent, and
through time stopping up from grease, etc., that may be
carried by said splashing, thereby spoiling the purpose it
was supposed to remedy. However, that has not been my
experience; on the contrary, I have always found the said
vents perfectly open and as clean almost as when put in.
I think it is a benefit to the trap-seal where such action
takes place, as some of the water thrown up naturally falls
back into trap and filling same, as intended it should be.
There may be cases where the waste may become stopped,
said stoppage back into vent, waste cleaned, and vent left
stopped. I have recently made some tests in this matter
on private houses I fitted up four vears ago and constantly
occupied. I have not found a stoppage in any of them.
Respectfully, JOHN RENEHAN.

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any ofter of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

MEAD'S REGENERATIVE GAS-LAMP.

THE following is an illustration of a new gas-lamp about to be jut on the market by the manufacturers, the National Meter Co., 252 Broadway, New York. The prin-

ciple of its construction, it will be noticed, is that the gas descends the centre tube, A, and igniting at the holes

B, the light is reflected from the enameled surface of the cone or regenerative chamber C. Some of the products of combustion pass into the regenerative chamber, and are returned to the inner side of the flame, securing a more thorough combustion of the gas. Air is admitted to the inside of the flame through passages not shown in the cut. It is claimed that in tests where less than seventeen feet of gas per hour was burned, a steadier and stronger light was secured than from a six-burner chandelier.

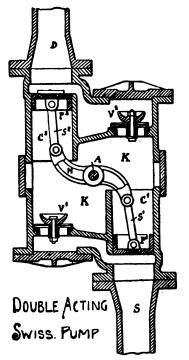

The illustration shows a view of one design. The pulls are for turning on or shutting off the gas.

NOVEL DOUBLE-ACTING PUMP.

Two Swiss inventors, Messrs. Buss and Muller, have contrived a double-acting pump with a single pair of valves.

The illustration, which, with the description, is taken from *Chronique Industrielle*, shows the two cylinders, C¹

and C^9 , open at both ends and connected, through the central chamber K, with the suction and discharge pipes S and D by the valves V^1 and V^9 respectively. The rock-

ing-shaft A controls the pistons P^1 and P^2 by the beam H and links S^1 and S^3 .

In their movement the two pistons simultaneously increase or diminish the volume of chamber K. In the first case the suction-valve V¹ opens and admits into K a quantity of water equal to the sum of the volumes of the two cylinders, while, at the same time, the piston P² forces half that volume into the discharge-pipe, and the piston P¹ displaces a like amount into the suction-pipe, so that only half the quantity has to be drawn in. On the reverse stroke the two pistons approach each other and discharge through valve V² a volume of water equal to the diminution of the chamber K, but the receding of piston P² permits only half of that volume to be forced through the discharge-pipe, while the receding of piston P¹ draws the same volume into the suction-pipe as before.

Thus the valves work alternately, and the pistons also each on its up-stroke only, causing a continuous and uniform flow both in the suction and the discharge pipes.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

A MEETING of the society was held on Wednesday evening, January 4, the President, William E. Worthen in the chair. The paper of the evening was "The North River Bridge Problem, with a Discussion on Long-Span Bridges," read by Mr. Gustav Lindenthal, M. Am. Soc. C. E., of Pittsburg, Pa. The writer outlined a gigantic scheme for constructing a suspension bridge across the Hudson River for the purpose of bringing all the great railroad lines into New York City somewhere above Fourteenth Street. The proposed bridge is to be of the suspension type, and will have two steel towers, located on either shore inside of the pier lines, which will be 500 feet in height. There will be three spans. The length of the central one will be 2,850 feet from centre to centre of towers, and the length of spans between the towers and anchorages are each to be 1,500 feet.

The anchorage must necessarily be very large, the dimensions being 210 wide by 320 feet long, and 210 feet in height.

The roadway is to be 86 feet in width, and will accommodate six tracks.

The longest single span designed up to the present day is for the Forth Bridge now being constructed in Scotland.

After going into the details of his plan to some extent, the writer gave a short description of the different elements of construction and typical constructive details of floor systems and wind cables, followed by a discussion of the cantilever and arch type of bridges, and temperature strains in iron bridges.

The writer advocated the building of a bridge in preference to a tunnel, and stated that a bridge with six tracks would accommodate all of the railroads desiring to enter this city and could be constructed at a smaller cost than the number of tunnels that would be required to furnish the same accommodation, and this cost could be estimated with more certainty.

A bridge built according to this plan would furnish transportation facilities for 50,000 passengers per hour in one direction, probably sufficient to meet the demands for fifty years to come.

The estimated cost for constructing the bridge alone, including the piers and anchorages, would not exceed \$15,000,000, exclusive of land damages.

A discussion of this interesting paper will follow at a future meeting of the society, and further particulars, with illustrations showing how this proposed structure compares with the great bridges of the world, will appear in our next issue.

The following candidates were declared elected:

As Members.—Channing Moore Bolton, Chief Engineer Richmond and Danville Railroad and Manager Richmond City Street Railway, Washington, D. C.; De Clermont Dunlap, Division Engineer, Kansas City Extension C. M. & St. P. Ry., Chicago, Ill.; Henry Holbrook Gladding, engaged chiefly on sewerage, New Haven Conn.; Arthur Hawiland (elected Junior January 4, 1882), Sanitary Engineer and Assistant City Engineer, San Antonio, Tex.; Camille Stanislaus d'Invilliers, engineer in charge of surveys and construction Tyrone Division Pennsylvania Railroad in Clearfield coal region, Phillips burg, Pa.; Charles Hees Ledlie, Civil Engineer, St. Louis, Mo.; Henry Benjamin Patten, Division Engineer Wyoming Division Union Pacific Railway, Cheyenne, Wyo.; Frederick John Henry Rickon, City Engineer, Little Rock, Ark.; John Munrhad Stewaith Assistant Engineer New Croton Aqueduct, Pobbs Ferry, N. Y.; George Francis Wright, City Surveyor, Santa Barbara, Cal.

As funiors.—Julius Le Roy Adams, engaged on construction Williams' Bridge Reservor, Brooklyn, N. Y.; Francis Henry Bainbridge, Assistant Engineer Edge Moor Iron Co., Wilmington, Del.; Eugene Carroll, Resident Engineer Covington Transfer Ra.lway, Covington

Ky : Russell Wadsworth Hildreth, with Union Bridge Co. on the Willamette River Bridge for Oregon Railway and Navigation Co. residence, New York City; Alexander Edward Kastl, Transitman Atchison, Topeka and Santa Fe Pailroad, Chicago, Ill.; William Anthony Lydon, Assistant Engineer with Drainage and Water-Supply Comm ssion, Chicago, Ill.; Alexander Potter, Assistant in office of Chief Engineer Chicago, Santa Fe and California Railway, Kan-

THE ENGINEERS' CLUB OF PHILADELPHIA.

THE Secretary is very glad to be able to announce to the members that both members and guests seem to have been much pleased with our decennial reception, held December 17, 1887. It is almost impossible, we find, to exactly determine the number present, but it looks very much like 342. We were not, however, overcrowded, and judging from the fragments that remained, everybody had enough to eat, ----, and smoke. There was no speechmaking or any attempt to introduce any feature which might have deprived the affair of an entirely informal and purely sociable character. It is believed that this entertainment will be of substantial and permanent benefit to HOWARD MURPHY,

Secretary and Treasurer

THE STRENGTH OF A BALCONY WANTED.

ST. PAUL, December 15, 1887.

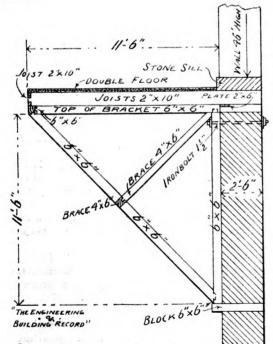

ST. PAUL, December 15, 1887.

SIR: I have made plans for a five-story building for Mr. J. E. Brady, of this city. The building has a porch on the side facing the river, of which I send you a sketch showing the exact construction of the said porch. The building inspector of this city says that a row of men stationed in a line at the extremity of the porch would cause it to break. As I am under the impression that the building inspector is not in the right, I beg you to do the owner of the building and myself a favor by stating in your journal what safe load will the said porch carry and what is its breaking load, and oblige.

The Brady Building Porch.

[The balcony is 45 feet long by 11 feet 6 inches wide, and is supported on four brackets placed 14 feet apart, which, by means of stringers at the outer edge, carry the 2x10-inch floor-beams spaced about 15 inches C to C, and whose inner ends are built into the wall.

Assuming that all the connections are perfect so as to causeno reduction of section and develop the full strength of every part, the following are the safe and breaking loads due to each member, supposing it for the time to be the weakest.

CROSS SECTION OF PORCH SHOWING BRACKET

The details of the connections are not clearly shown, and, as far as indicated, see altogether inadequate. For instance, the connection of the top of the brace to the outer stringer instead of to the horizontal piece called "top of bracket" is an inexcusable blunder, and renders the brace nearly useless, unless it is connected to the "top of bracket" by some means not suggested by the drawing.

On the other hand, the 11/2 inch bolt through the wall is absurdly large and unnecessarily weakens the timber through which it passes, for it can have no greater pull on it than that sustained by the tenon on top of the upright which it holds, which probably could be safely sus-

tained by a bolt not much over half its diameter. In any case the tenon can have no more strain than what may be due to the horizontal outward trust of the top of the brace, which, with the inadequate connection before mentioned, would be very little indeed.

These safe loads, then, have merely a theoretic value and cannot be taken as reliable for this particular structure without further particulars.

The breaking load of the floor-beams alone without the brackets would be 272 pounds per square foot, and the safe load 34 pounds per square foot, supposing that part of the wall resting on them to be heavy enough to keep them from prying it up. This would be true only in case the weight subtracted from the superincumbent wall by openings was balanced by the additional load put upon it by the upper floors, and also in case the wall, which is said to be 20 inches thick, above the balcony were offsetted on the outside only so as to be flush inside.

The inclined struts of the brackets cannot be considered to be properly braced, as there is nothing to prevent them from deflecting simultaneously to the same side, and therefore they would be liable to break at a floor-load of 176 pounds per square foot, and would not be safe for more than 22 pounds per square foot.

The load per square foot that could be safely supported on the balcony by the 11/2-inch bolts is about ten times as much-a ridiculous disproportion.

It must not be assumed that because the floor-beams, as cantilevers without the brackets, would safely carry 34 pounds per square foot, and the brackets alone would safely carry 22 pounds per square foot, that the two together would be safe for 56 pounds per square foot, for the brackets, by reason of their greater stiffness, would take nearly all the load at first and not till they had been crippled, so as to afford little, if any, support, would the cantilever action of the beams come into play.

From the safe loads given above the weight of the structure, which cannot be much less than ten pounds per square foot, must be subtracted to find what can be safely borne, which is very little indeed-hardly, as far as the brackets are concerned, equal to a good fall of snow.

The New York building laws require all dwelling-house floors to be proportioned for a live load of 75 pounds per square foot, and those of public resorts for a live load of 120 pounds per square foot, and nothing is more liable to overcrowding than a balcony in case of any public display or excitement.

As between our correspondent and the building inspector, we think they are both right, for while the inspector would have failed in his duty had he not condemned such a flimsy and ill-proportioned structure, it would probably for a long time have been safe for a single row of men at its outer edge, provided always that the connections were adequate and the wall so heavy and so placed as to hold down the beams.

We have given more consideration to this case than we should otherwise have done, as it is the not infrequent one of a builder anxious to do what is right, but unable, through lack of scientific knowledge, to determine in an unusual case what the right thing is.

We trust it may serve to warn those who may have similar problems that a due regard for the lives and property of their neighbors would require them to take competent professional advice in all matters of which they are not absolutely certain.

In this respect our correspondent has set them a commendable example, though, as a rule, the nearest good engineer is the proper person to whom to apply.]

PROPOSED NEW LIGHT-HOUSE AT CAPE HATTERAS.

RECENT press dispatches state that the Lighthouse Board is considering the feasibility of erecting a lighthouse of the first order on the outer shoals at Cape Hatteras. These waters, which are regarded as the most dangerous on the Atlantic coast, are now insufficiently protected. The engineering difficulties in the way of the construction of a lighthouse on the shoals are so many that the recent developments in constructive engineering were needed to insure success in the undertaking. Plans for the work are now being prepared.

THE Master Builders' Exchange of Philadelphia intend celebrating the first anniversary of their existence by a grand complimentary banquet to its members and many distinguished guests on January 24 at St. George's Hall, when it is expected some 400 persons will be present.

SOUNDING BY MEANS OF TORPEDOES.

A DUBLIN inventor, Mr. J. Joly, has devised a method of expeditiously obtaining soundings from a moving vessel. He drops overboard a torpedo arranged to explode on striking the bottom. The time that elapses in different depths of water between dropping the torpedo and hearing the report of its explosion having been previously ascertained by experiment, the observer, with a stopwatch, which may graduated to depths instead of seconds, and equipped with an ear-trumpet, a telephone dipping into the sea, can readily determine the soundings. For shallow water the ear-trumpet may not be necessary.

LEBANON, PA., WATER-WORKS.

R. J. SHERK, Superintendent of the Water-Works of Lebanon, Pa., reports that the cost of the works was \$252,000, and the debt is \$150,000. The population is now 14,000 and the daily consumption 1,000,000 gallons. There are 23 miles of pipe, with 1,940 taps, 4 meters, and 90 hydrants. The pressure is 60 pounds. The supply is by gravity and a temporary pumping plant.

BUILDING IN MINNEAPOLIS.

THE total amount of building in this city for the past year amounted to \$9,311,372. Nearly 150 business blocks were erected at a cost of \$1,000,000; nearly \$200,000 has been put into churches; the educational institutions erected have cost \$407,000; in manufacturing, \$271,860 has been expended; new grain elevators have cost \$350,000, and \$425,000 has been spent on bridges.

A CORRECTION CORRECTED.

OUR artist was right after all about those hook-bolts illustrated in our last issue. The bolts being used as stated, to secure the cross-ties to the track-stringers, or what en the L-roads are the longitudinal girders, are, of course, used with the hook end down, as shown,

The head of bolt A exactly resembles the clip used with a lag screw for fastening the rails on the L-roads, and misled us for the moment.

RECENT PUBLICATIONS.

MESSRS. CARRERE & HASTINGS, of New York, the architects of the Ponce de Leon and the Alcazar, the notable hotels recently built at St. Augustine, Fla., have issued a very attractive publication in which the advantages of St. Augustine are set forth. Among the beautiful illustrations in this publication are perspectives of these two famous hotels and interior of bits of detail; also of the Casa Monica, of which Mr. F. W. Smith is the architect. Among the illustrations are reproductions of the drawings that are so attractive a feature of the Architectural League of this city.

"THE LOCOMOTIVE ENGINEER."

WE have received the first number of this journal, issued by our friends, the publishers of the American Machinist. The new journal is to be devoted to the "special interests of locomotive engineers and firemen and locomotive maintenance and repairs." In its salutatory it announces that its editor, Mr. John A. Hill, left his locomotive to accept his present position. We wish our new contemporary the fullest measure of success, and it certainly starts out with good prospects, since its promoters have been so successful in establishing so good a paper as our esteemed contemporary, the American Machinist.

THE TEHUANTEPEC SHIP-RAILWAY.

COLONEL JAMES ANDREWS, of Pittsburg, who was Mr. Eads' principal associate in his various undertakings, and has since the death of the latter been really at the head of the Tehuantepec Ship-Railway project, has brought to New York the very complete and valuable model of the shiplifting appliances which Mr. Eads had made when in England four years ago, and is having it set up in the Mills Building preparatory to more active operations in furtherance of this great enterprise.

PERSONAL.

DR. O. W. WIGHT, Health Commissioner of Detroit, Mich., has just returned from his trip around the world.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITIONS.

CORNING, N. Y.—Plans are wanted for a Y. M. C. A. building to be built in this city.

BRIDGETOWN, N. J.—Plans for a \$30,000 building are wanted by the Y. M. C. A.

MAMARONECK, N. Y.—The Y. M. C. A. wants plans for a new building to cost \$50,-

TRADE CATALOGUES.

MESSRS. FRANCIS MORANDI & SON, of Nos. 50 Union and 37 Friend Streets, Boston, Mass., have just sent us their new catalogue illustrating and describing a variety of ranges, steam-tables, steamers, kettles, urns, copper and iron goods, etc., for restaurants, hotels, etc., manufactured by them.

For works for which proposals are requested see also the "Proposal Column," pages i-v-v111-05.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE ENGINEERING & BUILDING RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

WATER. SEWERAGE, ETC.

WELLAND, CAN. — Our correspondent rites: "By-law has been passed authorizing use of \$32,000 for the erection of water-works, and all arrangements have been made to secure water-power from the Government of the Dominion with Lake Erie for a head, and it is the intention of the corporation to proceed with the construction as soon as spring opens."

MOUNT VERNON, ILL.—Our correspondent writes from here as follows: "The waterworks scheme has fallen through."

READING, PA.—Our correspondent writes: "The Council will ask for proposals for the construction of two large sewers, to cost \$60,ooo, in February.

FORT WAYNE, IND .- The Natural Water-Supply Company, of Cincinnati, offers to furnish Fort Wayne, Ind., an inexhaustible supply of water by a series of filter wells to be put down by a steam process, charging for the system complete \$190,000. The company agrees to furnish 3,000,000 gallons of water per day.

RANTOUL, ILL.—Concerning water-works matters here our correspondent writes as follows: "Our town has in contemplation the nonlows: "Our town has in contemplation the building of small works in that line on the tower and tank plan. Tower about forty feet, tank to hold about 600 barrels. We expect to pump by wind-power for the first year."

HERKIMER, N. Y.—Our correspondent writes: "Our water-works will be a reserve supply and direct pumping system. At this date cannot give full particulars, but will as soon as possible."

COXSACKIE, N. V.—In answer to an inquiry about the reported building of water-works here our correspondent writes: "There has been property bought here for water-works, but when they are to be put in operation no one seems to know. The property was purchased by Mr. Benjamin H. Stevens, Flatbush, L. I. By writing to him you will get the information."

MT. STERLING, KY .- Mr. H. Clay McKee writes from this place as follows: "Some steps have been taken looking towards the construction of water-works for this city. I am one of a committee to look after the matter, but no contracts have yet been made to construct them."

ROCKFORD, ILL.—It is reported that a sew-erage system is to be established here.

LEBANON, PA .- Our correspondent writes: "The city is furnished with water by gravitation at present. There is some talk of making an additional supply by means of pumping, but the city is not in a position financially to warrant the additional debt. In case of a drought we have a temporary pumping of water into the mains for which the city pays \$30 per 1,000,000 gallons of water." The city is furnished with water by gravita-

KANSAS CITY, Mo .- Concerning the building of additional sewers here our correspondent writes as follsws: "Plans are about completed for sewers in two districts, the work for which will be for letting about February 10. The probable cost of both is \$45,000. Further plans and work in a great measure depend upon the construction of the O. K. Creek sewer, delayed by want of money, \$250,000, a large part of which I have hope will be provided from our next tax levy, in May next."

HENDERSONVILLE, S. C .- Our correspondent writes, concerning the water-works, as follows: "The election was held in this town January 2 and resulted in a unanimous vote for water-works. We want to issue bonds soon and let the contract."

SEABRIGHT, N. J .- Concerning water-works matters here our correspondent writes as fol-lows: "Company organized; 2 Hall steampumps, 14x7x12 and 2 boilers; stand-pipe contracted by Cunningham Iron Works, Boston; water supply from bored wells; pumphouse nearly finished; foundation of stand-pipe in progress."

AMERICUS, GA.—Address the Mayor for information of new water-works, reported to be built here.

ROANOKE, VA.-It is reported that the Mayor can give information of a projected sewerage system for this place.

WARRENTON, VA.-It is reported that a New York company has made a proposition to build water-works and erect an electriclight plant here. The Mayor can give infor-

LINDSBURG, KAN.—It is reported that water-works are to be established here.

ACUSHNET, MASS.—Concerning a report that water-works were to be erected here, our correspondent writes: "I know of no waterworks in contemplation here in Acushnet."

BRIDGES.

FALL OF A BRIDGE AT PITTSBURG.

PITTSBURG, PA.—The bridge across the Allegheny River at Thirtieth Street, that city, fell into the river on Monday morning last, the ice having taken out the false work.

The contract was originally let to D. W. C. Carroll & Co., but, subsequently, it was given to the Keystone Bridge Company, and they had just taken hold of the work and will be the losers.

DAVTONA FLA -Concerning a report that a bridge was to be erected here, our correspondent writes as follows: "There is no spondent writes as follows: There is no public bridge to be built here; there is talk of a bridge over the Halifax River by private parties, but has not taken definite shape as yet. Perhaps will in the near future.

VINCENNES, IND.—A \$32,000 bridge is to be built here across the Wabash. The city officials have charge of the construction details.

JEFFERSONVILLE, IND.—It is reported that a bridge is to be built between this city and Louisville, Ky., to cost about \$1.250,000. It is said that plans are wanted, and that information can be had by addressing the Hon. Jonas G. Howard, Washington, D. C.

GAS AND ELECTRIC-LIGHTING.

TROY, ALA.-It is reported that an electriclight plant is to be erected here.

DE FUNIAK, FLA.—The streets of this place are to be lighted by electricity.

MILWAUKEE .- The residents of the northwestern portion of Milwaukee are complaining because the electric lights contracted for by the city are not placed in position and running.

The contract was let some time ago for 30 electric lights to be in operation by December 15, but the poles are not erected yet.

MOUNT VERNON, N. Y .- This village has entered into a contract with the electric-light company for the latter to furnish 30 street lamps at a cost of \$100 a lamp a year, and with the gas company to furnish 150 street lights at a cost of \$20 a lamp a year.

FREDERICK, IND.—Efforts are being made to establish an electric-light plant here. W. A. Dunn, of Baltimore, is at the head of the

CLEVELAND, TENN.—The Mayor can give information concerning the erection of an electric light plant here.

LEXINGTON, KY.—It is reported that the local gas company will enlarge its works.

HAMPTON, VA.—An electric-light plant is to be established here. For details address James W. Nagley, Pittsburg, Pa.

AMERICUS, GA.—Gas-works will probably be established here. The Mayor can give de-

STREET WORK AND PAVING.

MILWAUKEE.—The Board of Public Works will boulevard Pleasant Street, from Van Buren to Franklin Streets, 5 blocks. The following streets will be repaved: Juneau Avenue, from Milwaukee to Market Streets, 2 blocks; Van Buren, from Knapp Street to Jun-eau Avenue, t block; Knapp Street, from Astor to Franklin Street, I block; Prospect Avenue, from Royal to Lafayette Place, 3 blocks; North Water Street, from Juneau Avenue to Lyon Street, 2 blocks.

RAILROADS, CANALS, ETC.

MILWAUKEE, WIS.—The 1,300-foot tunnel on the Chicago, Madison & N. R. R. Co., three miles north of Monticello, is nearly com-In five weeks the arch supports will be completed and the steel laid through the

The Milwaukee & Lake Geneva R. R. Co. will build 55 miles of track, from Milwaukee to the State line. A large part of the grading has been done.

The contract to build three miles of track at Marion, Iowa, has been let by the Chicago, Milwaukee & St. Paul Railway Co. to Harrisch & Green, of Milwaukee. It will be necessary to remove 100,000 yards of earth to make one cut on this piece of work.

The Wisconsin Central Line will build from Antioch (or near there) on their present main line to Geneva, thence up to Portage by the new route of the Geneva & Portage R. R., thus connecting them with their Southern

Thomas S. King, a New York contractor, has been looking over the old Milwaukee and Beloit Railroad and says it will be rebuilt this summer. He was accompanied by two engineers from Chicago who investigated the feasibility of raising the Central Line's bridge at Mukwonago, Wis. It can be raised six feet and the new road, the Milwaukee Peoria & St. Louis R. R. Co., can pass under the Cen-tral's road. The officers of the new road are tral's road. The officers of the new road are W. F. Dalrymple. President, Milwaukee; George H. Noyes, Secretary and Treasurer, Milwaukee; J. R. Robinson, Chief Engineer, New York.

WEATHERFORD, TEX.—The Weatherford Street Car Company has been organized and will commence building in a short time.

HAMPTON, VA .- James A. Nagley, Pittsburg, Pa., can give information concerning an electric street railway to be built here.

McKenzie, Tenn.-It is said that W. E. Harding can give details of a proposed street railroad for this place.

BIDS OPENED.

ST. PAUL, MINN.—Synopsis of bids for water-gates, opened December 28 by the Board of Water Commissioners: R. D. Wood & Co., Philadelphia, Pa., \$6,645.56; Eddy Valve Co., Waterford, N. Y., \$5,820.50; Coffin Valve Co., Boston, Mass., \$5,905; Whittier Machine Co., Boston, Mass., \$8,121.75; Galvin Brass and Iron Works, Detroit,

Mich., \$5,231.50. The contract will be awarded January 10.

MILWAUKEE, WIS .- The following bics were opened for paving the gutters and graveling the roadway on Seventeenth Avenue, from Orchard to Maple Street, December 30, 1887:

BIDDERS.	Graveling. Per sq. yd.	Paving. Per sq. yd.
Louis Pegler. John Dierschow F. Hildebrand, Jr. Adolph Weidner. Matthew Heiden. Julius Duehnike Loreiz Seymor. Henry Vogt.	63 58 58	50c. 42 43 ¹ / ₄ 42 43 *30 ¹ / ₄ 50 43

* The contract was let to Henry Vogt at 37c. for the graveling, and to Julius Duehmke at 36%c. for the paving.

ST. PAUL, MINN.—Synopsis of bids for 5,000 tons cast-iron water-pipe, in sizes from 4 to 36 inches, opened December 29 by the Board of Water Commissioners: R. D. Wood & Co., Philadelphia, Pa., \$163,063.62; D. Long & Co., Louisville, Ky., \$158,390.80; the Addyston Pipe & Steel Co., Newport, Ky., \$163,076; Lake Shore Foundry, Cleveland, O., \$159,719.90; Shickle, Harrison & Howard Iron Co., St. Louis, Mo., \$153,673.20; the McNeal Pipe & Foundry Co., Burlington, N. J., \$181,132.07. The contract was awarded to the lowest bidders. St. Paul, Minn.—Synopsis of bids for

NEW YORK CITY, N. Y.--The following bids were opened January 4 by the Department of Charities and Correction for furnishing two steam-boilers at Central Islip, Long Island, N. Y. Bidders: P. Carraher, Jr., \$2,397; James Moore, \$1,995; S. Reid, \$1,690

For steam heating for one pavilion on Randall's Island. Bidders: P. Carraher, Jr.,

\$2,797.
For furnishing one duplex steam pump at Central Islip, Long Island, N. Y. Bidders: P. Carraher, Jr., \$1.479; George B. Blake Manufacturing Co., \$723; Hall Steam-Pump

For constructing three pavilions, a diningroor constructing three pavinons, a uningroom and kitchen, an administration building, a storehouse and a stable and wagon-house, at Central Islip, Long Island, N. Y. Bidders: J. H. Brady, \$33,443; William S. Velsor, \$31,000; James Moore, \$35,975; Thomas Lyons, \$47,000.

For constructing a water-tower and tank residence, engine and boiler-house, at Central Islip, Long Island, N. Y. Bidders: James Moore, \$6,533; Thomas Lyons, \$7,500; J. H. Brady, \$5,986; William S. Velsor, \$7,800.

NEW YORK CITY.-The contract for the construction of the gate-house and superstructure at South Yonkers on Section 9 of the Aqueduct has been let to O'Brien & Clark at \$20,935.

BUFFALO, N. Y.-C. K. Summerhays has received the contract for steam-fitting and apparatus for the Lewis Building, at \$6,000, and Home for Young Girls, at \$3,000.

INDIANAPOLIS, IND.—C. K. Summerhays, of Buffalo, N. Y., has received the contract for steam-heating of the residence of M. Mil-

ST. PAUL.-Contracts awarded by the Water ST. PAUL.—Contracts awarded by the Water Board for 5,000 tons of pipe, both for high and low service, for Merriam Park and for West St. Paul, awarded to the Shickle, Harrison & Howard Iron Company, of St. Louis, for \$155,500. Bids for valves were opened and laid over until the next meeting of the board, to be held January 10. The contract for stop-cock boxes and valve-boxes was awarded to A. W. Morgan, of Buffalo, for \$3,143.50. The contract for brass goods was awarded to the Thomas & Wentworth Manufacturing Company, of Milwaukee, for \$1,520.

MINNEAPOLIS, MINN.-E. T. Sykes has Bids were: Porter Steam-Heating Company, \$1,650; Hantun Steam-Heating Company, \$1,590; F. F. Martin, \$1,344; E. T. Sykes & Co., \$1,340.

NEW ORLEANS. LA.—Synopsis of bids for NEW URLEANS, LA.—Synopsis of bids for furnishing a quantity of 12 inch cast-iron pipe, opened December 30 by W. I., Fisk, ('aptain of Engineers, U. S. A., Lighthouse Engineer: Woodward, Wight & Co., New Orleans, La., \$44 per ton; James H. Aitken & Co., New Orleans, La., \$40.

BROOKLYN, N. Y.—The following proposals were opened December 29 and announced for furnishing gas or other illuminating material for street lamps and public buildings in the city of Brooklyn for the year buildings in the city of Brooklyn for the year 1888, to wit: People's Gas-Light Company, per lamp, \$22 per year; lighting public buildings, per 1,000 cubic feet, \$1.60; Nassau Gas-Light Company, per lamp, \$22 per year; lighting public buildings, per 1,000 cubic feet, \$1.60; Metropolitan Gas-Light Company, per lamp, \$22 per year; lighting public buildings. \$1.00; Metropolitan Gas-Light Company, per lamp, \$22 per year; lighting public buildings, per 1,000 cubic feet, \$1.60; Williamsburg Gas-Light Company, per lamp, \$21.75 per year; lighting public buildings, per 1,000 cubic feet, \$1.60; Citizens' Gas-Light Company, per lamp, \$22 per year; lighting public buildings, per 1,000 cubic feet, \$1.60; Brooklyn Gas-Light Company, per lamp, \$19.80 per year; lighting public buildings, per 1,000 cubic feet, \$1.50; Citizens' Electric Illuminating Company, per light, \$182.50 per year: ing Company, per light, \$182.50 per year; Municipal Electric-Light Company, per light, \$182.50 per year.

William Rothwell, \$9,800; for vent., \$48. R. G. Campbell, \$9,045; for vent., \$100. John Mitchell, \$10,600; for vent., \$125.

MISCELLANEOUS.

MILWAUKEE.—A \$40,000 fire-tug will be purchased by the city of Milwaukee to protect river property.

The sum of \$20,000 will be expended in improvements in the Seventh Ward as follows:
Repaving Van Buren Street from Wisconsin
to Biddle Streets (three blocks).

Repaving Oneida Street from East Water Street to alley near Broadway (one and a half New pavement cedar blocks from alley on Oneida Street to Broadway (half block).

Paving Broadway with cedar blocks from Johnson to Mason Streets (four blocks). Paving Johnson Street one block from Broadway to East Water Street.

A top dressing of broken granite on Milwaukee, Van Buren, and Biddle Streets (about ten blocks) on macadamized streets.

Paving alleys in blocks 53 and 101.

MILWAUKEE, WIS.—The Hinsey Cable Railroad ordinance has passed the Council and been signed by the Mayor and has become a law. They will use the Rasmussen system and will run on Milwaukee Street from Michigan Street, on Oneida Street, Wells, Seventh, State, to city limits, and a branch on corner State and Eighteenth, to run on Eighteenth Street to city limits on the north.

LIVINGSTON, MONT.—San Francisco capitalists will put in smelting works. Certificates of incorporation for a railroad to run from Livingston to Castle Mountain were filed in the office of Territorial Secretary Webb. Governor Hauser is at the head of the enterprise and the smelting-works. Both are assured facts, to be commenced as soon as the weather will permit

NEW CORPORATIONS.

THE Amsterdam, N. Y., Arc Light Co.; capital stock, \$15,000. J. O. Hirschfelder and others, incorporators.

THE Mahoning Gas Fuel Company, Youngstown, O., capital increased from \$500,000 to \$750,000.

THE Gas and Electric Light Company, of York, Neb.; capital, \$8,000. M. Soverign and others, incorporators.

THE Hallett Electrical Illuminating and Power Company, Kansas City, Mo.; capital, \$60,000. A. L. Ellis and others.

THE Mount Carmel, Ind., Natural Gas and Improvement Company; capital, \$10,000. J. Johnston and others.

THE Pacific Railway Company of Nebraska The racine Ranway Company of Archassa: The capital stock is \$6,600,000. The proposed railway begins at a point on the south line of Hall County, and runs in a north-westerly direction to the west line of Nebraska, with the right to construct branch lines to other places within the limits of the State. The road is believed to be an extension of the Hastings branch of the Missouri Pacific.

THE DRS Moines and North-western Railway Company, Des Moines, Iowa. Capital stock, \$4,000,000. G. M. Dodge, and others, incorporators.

THE Ohio Valley Railway and Terminal Company, Evansville, Ind. Capital stock, \$300,000. Charles Yeile, and others, incor-

THE Allegheny and Kinzua Railroad Company, Olean, N. Y. Capital stock, \$80,000. Charles G. Freck, and others, incorporators.

THE Wichita, Richfield and Trinidad Railroad Company, Richfield, Kan. Capital stock, \$4,000,000. F. F. Stevens, and others, incorporators.

THE Sault Ste. Marie Railway Company, Sault Ste. Marie, Mich. Capital stock, \$100,-000. W. Chandler, and others, incorporators.

THE City Electric Street Railroad Company, Little Rock, Ark. Capital stock, \$200,000. Howard B. Adams, and others, incorporators.

THE Kansas, Nebraska and Decatur Railroad Company, Claffin, Neb. Capital stock, \$3,000,000. Arthur W. Dole, and others, incorporators.

THE Citizens' Electric-Lighting and Power Company, at Kensington, Ill. Incorporators, C. B. Sawyers, C. E. Godfrey, and others.

THE Steel Car-Wheel Company organized at Portland, Me., with a capital stock of \$300 000. The stockholders are: S. Allen Freeman, Winthrop, Mass.; Nathan Washburn, and others.

PROPOSALS.

(Continued from page viii.)

SEALED PROPOSALS will be received at the office of the Supervising Architect of the U. S. Trasury Department at Washington, D. C., and opened at 2 r. M. of the 26th day of January, 18.8, for plumbing work and gas-piping tor the Court-House, Post-Office, etc., building at Dallas, Texas. Each proposal must be accompanied by a certified check for \$200, made payable to the order of the Treasurer of the United States. The right to reject any bids is reserved. The plans and specification can be had at this office, the office of the Superintendent, and at the offices of the secretaries of the following-named associations: Mechanics' Exchanges, Boston, Mass., St. Louis, Mo., and New Orleans, La.; Builders' Exchanges, Philadelphia, Pa., and Ci cinnati, Ohio; Permanent Fxhibit and Fxchange, Chicago, Ih.; and North-Western Permanent Fxhibit, Minneapolis, Minn. (Signed) WILL. A. FRERET, Supervising Architect. 5TH OF JANUARY, 1888.

WATER WORKS.—Proposals are wanted at St. eter, Minn., until March I, for building a complete stem of water works. Address C. R. Davis, City

BRICK BLOCK.—Proposals are wanted at Chattanonga, Fenn., until lanuary 14, for erecting a block of brick buildings. Address Divine, Vaudry & Co.

ELECTRIC-LIGHT PLANT. - Proposals a wanted at Hagerstown, Md., for putting in an electlight plant. No date specified. Address M. Funkhouser.

SEWER PIANS.—Proposals will be received by the Committee of the Board of Trustees of the village of New Rochelle, N. Y., until January 16, 1288, for making survey, drawing plans and specifications for a system of sewers for said village.

Further information can be had by applying to the committee. Address John Sheehan, of the commit-

CHURCH.—Proposals are wanted at Branchville, Ala, until January 16, for the erection of a church. Address T. M. Haygood.

STREET WORK.—Proposals are wanted at Brook-lyn, N. Y., until January 18, for doing work in certain streets. Address George Ricard Conner, Commis-sioner of the Department of City Works.

REPAIRING BRIDGE .- Proposals are wanted at Brooklyn, N. Y., until lanuary 18, for repairing the turning gear of Hamilton Avenue bridge. Address George Ricard Connor, Commissioner of the Department of City Works.

WATER-PIPE — Proposals are wanted at Nashville, Tenn., until January 10, for furnishing 1,150 feet of 8-inch and 1,150 feet of 6-inch cast-iron water-pipe. Address George Reyer, Superintendent of Water-Works.

DOCK-WORK.—Proposals are wanted at New York OUCK-WORK.—Proposals are wanted at New York City until January 16, for removing the existing pier at the foot of West Thirty-eighth Street, and for pre-paring for and building a new wooden pier and approach at the foot of said street, and for repairing the existing crib-bulkhead thereat. Address the Department of Docks, Pier 1, North River.

MOVING BUILDINGS.—Proposa's are wanted at San Francisco, Cal., until January to, for moving several buildings at Fort Winfield Scott, Cal., and also repairing. Address J. S. Oyster, 1st Lieutenant and Q. M. 1st Art., A. A. M., U. S. A.

CAST IRON PIPE, FITTINGS, etc.—Proposals are wanted at Baltimore, Md., until January 9, for furnishing several tons of cast 'ron pipe, fittings, brass stops, etc., according to specifications. Address Robert K. Martin, Chief Engineer Water Department.

FOUNDATIONS,—Proposals are wanted at Washington, D. C., until January 30, for furnishing and putting in place, complete, the timber pile foundations of the Court-House, Post-Office building, etc., at Key West, Fla. Address Thomas D. Fister, Acting Supervising Architect.

ELECTRIC LIGHT AND GAS FIXTURES.—Proposals are wanted at Washington, D.C., until Janug, for placing in position, in complete working order, in the Custom House Building, at Toledo, Ohio, certain electric light and gas fixtures. Address C. S. Fairchild, Secretary Treasury Department.

BROKEN STONE, ETC.—Proposals are wanted at Washington, D. C., until January 23, for furnishing broken stone, cement, sand, fire-bricks, or granite. Address James Fulton, Paymaster General, U. S. Navy.

DOCKING AND CALKING. — Proposals are wanted at Philadelphia, Fa., until January 12, for docking and calking Lightship No. 45. Address John J. Read, Commander, U. S. Navy, Light-House In

IRON CASTINGS.—Proposals are wanted at Char-leston, S. C., until January 9, for furnishing Street Department with iron castings for year 1888. Address the Committee on Streets.

STRFET-WORK.—Proposals are wanted at New York City until January 11, for street-work. Address Department of Publ c Works.

WATER-PIPE, CASTINGS, ETC.—Proposals are wanted at Franklin, Ohio, until January 18, for furnishing water-pipe, castings, etc., according to specifications. Address William Michael, of the Board of Water-Works Trustees.

SCH DOL.—Proposals are wanted at Gaine's Station, Mich., until January o, for electing a blick school house. Address School Building Committee, Gaine's Station, Mich.

WATER-WORKS SUPPLIES. — Proposals are wanted at Mount Morr's, N. Y., until January 20, for furnishing cast-iron pipe, hydrants, boilers, engine, and pump, according to specification. Address George W. Phelps, Mount Morris, N. Y.

PROPOSALS.

WATER-WORKS.—Proposals are wanted at Dallas, Tex., until January 11, for constructing, etc., trustorage and subsiding reservoirs, according to specifications. Address W. E. Parry, City Secretary.

SEWERS.—Proposals are wanted at Williamson, a., until January 18, for the construction, etc., of twers in certain streets. Address R. H. Farts, City

WATER-WORKS.—Proposals are wanted at Washington. O., until January 9, for the construction of a complete system of water-works. Address H. L. Hadley, of the Water-Works Committee.

PROPOSALS for the work and material to be furnished in enlarging the drill-hall of the State Armory in Brooklyn, N. Y., and providing a fence around the said armory grounds, will be received, util January 13, 1888, at the Stiete Arseral, Thirty-fifth Street and Seventh Avenue, New York City. Plans and specia cations may be seen at the office of architect Engage F. Caylor, 66 Broadway, Brooklyn, N. Y. A COLLECTION OF DIAGRAMS

Representing the General Plan of

TWENTY-SIX DIFFERENT WATER-WORKS,

Contributed by Members of the

New England Water-Works Association,

And Compiled by a Committee.

1887.

NEW YORK:

PUBLISHED BY THE ENGINEERING AND BUILDING RECORD, 82 & 84 FULTON STREET.

INTRODUCTION.

OFFICE OF SECRETARY,

- New Bedford, Mass., November 1, 1887. .
- NEW BEDFORD, MASS., November 1, 1887.

 THIS collection of diagrams is the result of the persistent efforts of Messrs. Wiiliam B. Sherman, of Providence, R. I., and Walter H. Richards, of New London, Conn., who, as a Committee on Exchange of Sketches, have secured these drawings from members of the Association. The following extract from a report presented by these gentlemen at the Manchester, N. H., meeting in June, 1887, will explain in part the origin of the collection:

 "In answer to circular letters sent out to members, there were received rough sketches of general plans of twenty-three
- "In answer to circular letters sent out to members, there were received rough sketches of general plans of twenty-three water-works represented in the Association. Having this data on hand, though crude in many particulars, it was decided to put the same into available shape for the benefit of the members. This has been accomplished by the Committee without cost to the Association. From these rough sketches—revised, reduced to uniform size of 10 by 15 inches—a set of tracings has been made, and a sample tolio of blue prints prepared. This folio and set of tracings are herewith presented as forming the main part of this report."

 Since the Manchester meeting three more subjects have been received and subscribtions for sets of reproductions from the tracings have been called for. The ready response to the call
- tracings have been called for. The ready response to the call is evidence of the value of the Committee's work, and arrangements were made with THE ENGINEERING AND BUILDING RECORD for publication in this present form.

 R. C. P. COGGESHALL,

Secretary, New England Water-Works Association.

HOTEL AND RESTAURANT FURNISHINGS.

PONCE DE LEON AND CASA MONICA.

THE fact that the entire kitchen furnishings for Florida's palace hotel, the Fonce de Leon of St. Augustine, were supplied by a Boston house, that of FRANCIS MORANDI & SON, 50 Union Street, rather tickles the pride of proud old Puritanical Boston. That the Messrs. Morandi were able to successfully compete with other leading firms of New York and the West and secure an order of such magnitude, is something that bonifaces throughout the country cannot afford to overlook, when either furnishing new or returnishing an old hotel. The order from the Ponced Leon comprised 20 tons of goods. This firm is now engaged in fitting up the Casa Monica at St. Augustine.

THE SIXTEENTH VOLUME

THE ENGINEERING AND BUILDING RECORD

THE SANITARY ENGINEER.

(June 4, 1887—November 26, 1887.)

Aside from the weekly record of events of special interest to Engineers, Architects, Municipal Officers, Mechanics, and Contractors, the following of the numerous special articles are mentioned as of permanent interest.

Full-Page Architectural Illustrations:

Waste-weir outlet of the Kangra Tank, Ahmedabad,

India.

ARTICLES OF SPECIAL INTEREST TO ARCHITECTS:

Result of Cincinnati Architectural Competitions.
Regarding the Study of Architecture; turther letters on this subject.

Description of the Children's Hospital at Walnut Hill, Cincinnati. (Three Illustrations.)
Building Construction Details—Balloon Frames. (Two Illustrations.)
Naurical Arena, Paris (description).
The Hastings, St. Leonard's, and East Sussex Hospolis (descriptions and plans). (Three Illustrations.)
Architecture of London Streets.
Bath-House of Hospital at St. Antoine, Paris. (Two Illustrations.)
Ready-Made Specifications (a criticism).
Fall of an Elevator in a New York Dry-Goods House. (Illustrated.)
Description of the Methodist General Hospital, Brooklyn. (Two Illustrations.)
Trussed Roof over a Drill-Shed at Bury, England. (One Illustration.)
Paris Ordinance Concerning Theatres.
Mud Architecture in Persia.
Dry Rot in a New York Apartment House, Fourth Avenue and Sixty-Second Street. (One Illustration.)
Grain Elevators (Description, with seven illustrations.)
Gettiysburg Cyclorama Building (details of roof and

tions.)

Gettysburg Cyclorama Building (details of roof and structural iron-work). (One Illustration.)

Paramount Requirements of a Large Opera-House (paper by D. Adler, Chicago).

Among the specially prepared articles in the series of Builders' and Contractors Engineering and Plant

of Builders and Constantion age:
are:
are:
Traveler for erecting Kings County Elevated
Railroad, (Three Illustrations)
Excavating apparatus used on the Tancarville
Canal and Sewer. (Three Illustrations.)
Derrock Foot Block and Sheaves at Shaft 14 on the
New Croton Aqueduct. (Two Illustrations.)
Potomac Flats Dredging Plant. (Four Illustraline)

Bound in cloth, with index, \$3.00. Postage 40 cents. THE ENGINEEL Street, New York. Obtainable at London Office, 92 and 93 Fleet Street, for 15s.

Tube Riveting Machine at Forth Bridge. (Two Illustrations.)
Lockwood Dredge used on Cape Cod Ship Canal (Eight Illustrations.)
Lockwood Dredge used on New Croton Aqueduct. (Two Illustrations.)
Recent Water-Works Construction—East Orange and Bloomheld, N. J., Water Companies. (Three Illustrations.) Water-Works at Ware, Mass. (Four Illustrations.) Water-Works at Calais, Me. (Three Illustrations.)
Pavements and Street Railroads—Continuation of this series, in which the question of wood pavements in London is fully discussed.
New Croton Aqueduct. No. XIII. Disc for Measuring Cross-section in Tunnels. (Nine Illustrations.)
Tipple for Dumping Cars on the New Croton Aqueduct. (Six Illustrations.)
Modern Sewage Disposal and Engineering. By E. S. Philbrick, M. Am. Soc. C. E. (Two Illustrated articles.)
Sweetwater Dam and Irrigation Experience in Southern California. (One Illustrations.)
Collapse of 75-Ton Derrick at Brooklyn Navy Yard.
Repair and Maintenance of Roads. By W. H.

Sweetwater Dam and Irrigation: Pepeliate to Southern California. (One Illustration.)
Collapse of 75-Ton Derrick at Brooklyn Navy Yard.
Repair and Maintenance of Roads. By W. H. Wheeler, C. E. Report of the Disposal of Sewage in the City of Worcester, Mass.
Portland Cement Tests at Long Dates.
Receiving and Catch Basins at Waterbury, Conn. (Four Illustrations.)
Testing of Portland Cement for the Harbor Works at Calais and Boulogne. By F. Guillair.
Carrying Water-Mains Across the River at Ekhart, Ind. (Two Illustrations.)
Tubular Subway Under Northumberland Straits. (Two Illustrations.)
Filtration or Subsidence. By J. D. Cook, C. E. Special Report of the Chicago Drainage and Water-Supply Commission.
Driven-Well System as a Source of or Means of Obtaining a Water-Supply.
Recent Sewer Construction. Chiswick Sewage Works. (Three Illustrations.)
Burial of Sewage and Refuse. (Criticism on an Address by Dr. G. V. Poore, of London.)
The Moteno Reservoir at Cape Town, Africa.
Downfall of the Suspension Bridge over the Ostrawitza. (Two Illustrations.)
Some Details of Water-Works Construction. By William R. Billings, C. E. (Four articles of this series, with illustrations, have appeared.)
Accident on the New Croton Aqueduct—Collapse of Bulkhead. (Four Illustrations.)
Preparing Refuse Stone for Concrete. (One Illustrations.)
History of the Development of the Art of Bridge Construction. By Prof. William P. Trowbridge. (Twelve Illustrations.)
Kanawha River Improvement (description, with six Illustrations.)
Armory Roof, Buffalo—Ro-foot combination roof, showing scaffold used in erecting. (Two Illustrations.)
Eads' Last Work—Letter written ten days before his death, giving details of construction regarding

showing scaffold used in erecting. (Two Illustrations.)

Each' Last Work—Letter written ten days before his death, giving details of construction regarding design of his plant. (Three Facsimile Illustrations.)

New Water-Works Tunnel, Chicago—Abstract of specifications. (One Illustration.)

Effect of Temperature upon Structural Iron and Steel—Paper by Joseph Ramsay, Sr.

Description of Water-Tower at Franklin, Mass. (Four Illustrations.)

Cape Cod Ship Canal (Description of Work), Manufacture of Hydrauic Cement from Blast-Furnace Slag. By J. E. Stead.

Wreck of Seneca Falls Stand-Pipe. (Description and Four Illustrations.)

Bursting of Little Falls Reservoir. (Description, Fall of Derrick at the New Court-House, Boston, Mass. (Two Illustrations.)

Fall of an Frecting Crane on the Union Elevated Railroad, Brooklyn, N. Y.

THE COMMERCIAL ADVANTAGES OF LOCKS AND DAMS FOR THE IMPROVEMENT OF RIVER NAVIGATION ON THE KANAWHA.

THE columns of THE ENGINEERING AND BUILDING RECORD have consistently advocated the improvement of rivers and their conservation, not only as an effective means of reducing the freight charges on railroads in this vicinity, but also because of the great economy resulting from river and canal transportation under reasonably favorable circumstances. These views are very fully borne out by the experience on the Great Kanawha River. In a recent report to Colonel William P. Craighill, U. S. Engineer in charge of the improvements there, made by Mr. Addison M. Scott, Resident Engineer, some exceedingly interesting facts are brought out.

The first locks and dams, Nos. 4 and 5, were

completed in 1880. For the year 1877 there were shipped from the mines by the river something over 5,000,000 bushels of coal, and nearly 8.000.000 by rail. There were then up to 1880 but two small mines above No. 5, shipping about 200,000 bushels per year. Since the completion of these locks the shipments have steadily increased. There are now 18 mines above No. 5, shipping their output by river, and for the year ending June 1, 1887, the shipments by river were over 23,000,000 tons, and by rail 19,000,000 tons.

The rates of towing have also been reduced, owing indirectly to improvements, but directly to the increased competition among tow-boats, the number having doubtless been largely increased as a result of the increase in business to be

The saving in freight over those by rail is very great. The charge for towing 263 miles from Charleston to Cincinnati is 25 cents for 2,000 pounds, or about one-twelfth of a cent per ton mile, and the total additional cost for care of barges, pumping, wharfage, piers, etc., would increase this one-quarter of a cent per bushel, or to 443/4 cents for 2,000 pounds, or a little less than one-sixth of a cent per ton mile. For longer distances this would be still less. For operators who own their own barges and tow-boats the total cost, including wear and tear, is about 28 cents for 2,000 pounds.

By rail the cost between Winchester, Ky., and Covington has been \$2.70 per 2,000 pounds; Charleston, W. Va., to Lexington, Ky., 190 miles, \$1.82 for 2,000 pounds.

The number of freight and passenger steamers has nearly doubled, being in 1886 ten, as against six in 1875. These handled in 1886 41,000 tons of miscellaneous freight and carried 59,000 passengers. In addition to these, four good steamers run from the upper Kanawha to points on the Ohio, carrying freight and passengers at low

The report shows that a very considerable increase in traffic will result from extending the system of slack-water navigation to the lower reaches of the river. The records of the gaugereadings as to depths suitable for navigation show that the season for shipment from the Kanawha can be lengthened over 100 days

before it will equal in length the season in the Ohio from the Kanawha down. In addition to this it will enable the dealers to save much of the time now required to "double up" their tows after bringing them through the present narrow channel, and to take advantage of any rise in the Ohio following one in the Kanawha (an opportunity now frequently lost). This will virtually bring the Kanawha mines 300 miles nearer to the markets on the Ohio and Mississippi rivers.

We have in previous numbers given a full description of the interesting works on the Kanawha, and it is with great pleasure that we record the marked success attending their use. We commend the subject to all those who persistently malign the honest efforts of our legislators to develop the waterways of the country.

THE ANNUAL OUTPUT OF RAILROAD ROLLING STOCK.

THE Railroad Gazette has taken pains to collect quite complete and valuable statistics in regard to this industry, which is of great importance, not only from its magnitude, but more especially as indicating the growth and condition of our railroads, as well as constituting a large factor in our commerce.

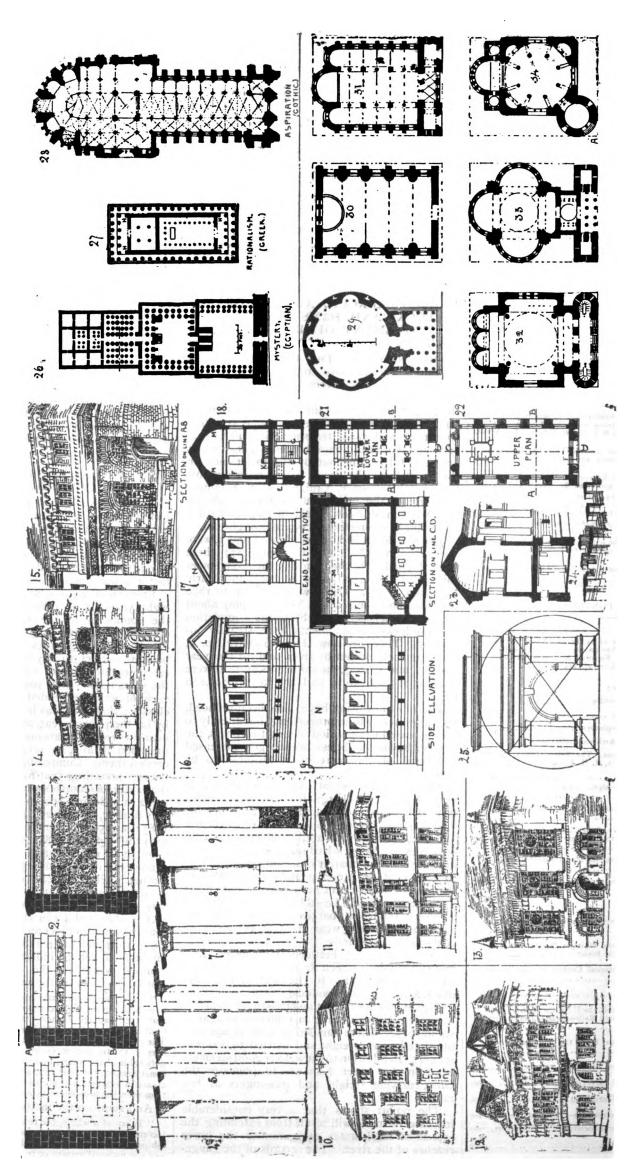

From these figures, which cover a period of eight years, from 1880 to 1887 inclusive, and the comments of the Gazette upon them, it appears that the largest output in most classes of rolling stock, or perhaps it would be more correct to say that probably the greatest aggregate value of output was in 1882, and the years immediately preceding and following, each of which exceeded it in some particular classes; that 1885 was in all but one small item by far the poorest year, and that 1887 had very nearly risen to the average of the best that had preceded it, and, in some respects, much exceeded them. Comparing it with the best and poorest preceding year for each class it appears that 2,044 locomotives were built in 1887, against 2,282 in 1882 and 800 in 1885; 16,145 freightcars in 1887, against 20,046 in 1881 and 3,555 in 1885; 14,056 coal-cars in 1887, against 8,100 in 1881 and 2,598 in 1885; 663 day passenger, baggage, mail, express, and caboose cars in 1887, against 587 in 1883 and 259 in 1885; 67 sleeping, dining, hotel, buffet cars, etc., in 1887, against 75 in 1881 and 17 in 1880; number of freightcars built per locomotive, 7.9 in 1887, against 10.1 in 1881 and 4.4 in 1885; and the number of coal-cars built per locomotive, 6.9 in 1887 against 4.9 in 1884 and 2.6 in 1880. These latter figures might be taken to indicate an increase in the hauling power of the locomotives, and this would appear to be the case, as the Gazette says:

"There can be but little doubt that the 2,044 locomotives built during 1887 represent a greater weigh and more haulage capacity than the 2,277 locomotives built in 1882, many of which were for the narrow gauge. The gradual increase in the number of engines with cylinders of 18, to and so inches in discrete the second se ders of 18, 19, and 20 inches in diameter has been very noticeable of late years, and when this fact is taken into consideration, the year 1887 shows a slightly smaller increase in numbers, but probably a larger increase in power than even the prosperous years 1882 and 1883."

And sums up the matter as follows:

"Taken as a whole, the returns certainly show that the locomotive and car-building industries are in a fairly flourishing condition, and the continued extension of railroads and the national growth of traffic on lines open will probably continue to provide plenty of work for locomotive makers and car-builders during the present year and for some time to come.'

ELEMENTS OF ARCHITECTURAL DESIGN.

A SPEEDING-TRACK IN NEW YORK CENTRAL PARK.

THE petition signed by some millionaire owners of trotting-horses and a few of their friends, that a portion of the Central Park be devoted to a speeding-track for their convenience and that of their jockeys and trainers, has called out such an emphatic protest that we think some of them, at least, will regret their hasty action. It would be an outrage, indeed, to have the portion of the park it is proposed to devote to such purposes made unsafe and unfit for ladies and children, and such it would quickly become, since the speeding of trotters would attract all the stable boys, jockeys, and loafers in the city to the locality, and line the avenue facing the park with rum-shops, otherwise known as "road houses.

PHOTOGRAPHY OF MOVING PROJECTILES.

Some instantaneous photographs of bullets in motion have recently been taken in Germany by Herren Mach and P. Salcher, and are mentioned in Engineering. The object of the experiment was to determine the waves formed in the air displaced by the motion of the bullet. When the projectile had a velocity of only 780 feet per second no waves were observed, but with velocities of from 1,110 to 1,730 feet per second very distinct photographs were obtained showing, in the clearest possible manner, the character of the waves set up by the bullet in its passage. From these it would appear that the air flows away from the bullet in hyperbolic lines, whilst a vacuum is produced immediately behind it,

NEW YORK QUARANTINE STATION.

VIEWS ON HOFFMAN ISLAND, N. Y. HARBOR.

WE give on page 108 four views taken from photos loaned us by Mr. F. N. Owen, who had them taken at the time of visits of the committee whose report was published in our These sketches forcibly illustrate how an last issue establishment of this kind is maintained by the Empire State under the circumstances cited in our editorial of last week.

THE ANNUAL MEETING OF THE ARCHI-TECTURAL LEAGUE.

THE Architectural League held its annual meeting at Sieghortner's, 32 Lafayette Place, on the evening of Monday, the 9th inst., some seventy members being present, with Mr. John Du Fais, President, in the chair. Polls for election of officers were opened I P. M.

The officers elected are as follows: John Beverly Robinson, President; Frederick Crowninshield, Vice-President; members of Executive Committee, Henry O. Avery, Charles I. Berg, James D. Hunter.

The annual report of the treasurer shows the League to be in a most satisfactory financial condition, so much so that the members feel quite sure that the League will be housed in its own quarters before the end of the present year. The membership has been largely increased and shows a steady and constant growth.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

THE annual meeting of the society will be held January 18 and 19, 1888, at the society house, 127 East Twentythird Street, New York.

Wednesday, January 18.—The meeting will open at 10 o'clock, and will continue through the day. Lunch will be served at the society house at 13:30 o'clock.

During the meeting the annual reports will be presented; officers for the ensuing year elected; the awards of the Norman Medal and of the Rowland Prize for the past year announced; the place for the next convention considered; proposed amendments to the constitution discussed; reports from various committees presented and discussed; technical subjects discussed; general business trans-

In the evening a paper on the Panama Canal in 1887 by Lieutenant C. C. Rogers, U. S. N., will be read by the author and discussed.

Thursday, January 19.—The arrangements for this day will be announced in detail at or soon before the meeting. They will include a visit to the bridge in progress of construction across the Harlem Valley (two steel arches of 510 feet span each, and seven granite arches in approaches.)

In the evening a reception for gentlemen will be held at the house of the society, and at 21:30 o'clock supper will be served.

William G. Hamilton, Charles W. Hunt, and John Bogart are the committee

The total membership of the society including all grades was 1,110 on January 1, 1888.

OUR ARCHITECTURAL ILLUSTRATIONS. THE UNION DEPOT, NEW LONDON, CONN.

THE UNION DEPOT, NEW LONDON, CONN.

THIS building was built by the New York, New Haven and Hartford Railroad Company, the New London and Northern Railroad Company, and the New York, Providence and Boston Railroad Company. A special red brick was used, made at Cambridge, Mass., similar to that used in Sever Hall in that city; interior finish, quartered oak. It was built from sketches left by the late H. H. Richardson, under direction of his successors, Messrs. Shepley, Rutan & Coolidge, of Brookline, Mass., the builders being the Flint Building and Construction Company, of Palmer, Mass. Mass.

THE BATH-TUB IN POLITICS.

THE New York Star says: "The last hero of the bathtub in politics that has been discovered is Senator Blackburn. A raw-boned female from Kentucky applied to him the other day for a position in the Interior Department. As she did not get it as soon as she wished, she called at his lodgings, and, forcing her way past his servant, went up to his room. The Senator was reclining comfortably in his bath-tub, which was protected from public view by a curtain. The Kentucky female calmly took a seat outside the curtain, and announced to the Senator, with freezing politeness, that she didn't propose to leave until he had furnished her the place she wanted. The Senator tried to pacify her; but it was of no use, and finally he had to give his promise. The determined Kentucky woman is now drawing a salary from the Government, and Mr. drawing a salary from the Government, and M Blackburn has taken a solemn oath never to enter his bath again when an office-seeker is within a mile."

NOTICE.

SUBSCRIBERS desiring copies of back numbers of Volume XVI. are requested to order them at once, remitting ten cents for each number ordered. The publisher does not undertake to supply back numbers more than thirty days after the close of each volume.

ELEMENTS OF ARCHITECTURAL DESIGN.* BY H. H. STATHAM.

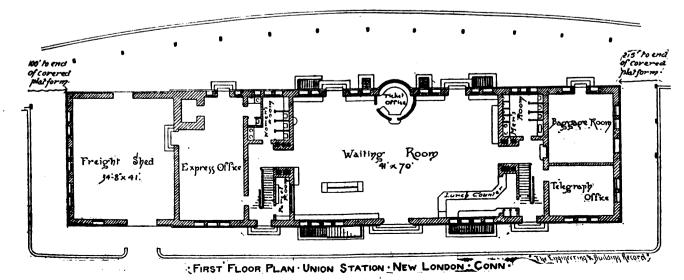

JUDGING from the nature of the correspondence architecture and the duty of architects which is frequently seen in columns of the daily papers, the Times especially, it would seem that the popular notion of archirecture now is that it is a study mainly of things connected with sanitary engineering—of the best forms of drainage and intercepting-traps. This is indeed a very important part of sound building, and it is one that has been very much neglected, and has been, in fact, in a comperatively primitive state until very recent times, and, therefore, it is not surprising that there should be a reaction in regard to it and that newspapers which follow every movement of public opinion, and try to keep pace with it, should speak as if the drain-pipe were the true foundation of architecture. I have a great respect for the drain-pipe, and wish to see it as well laid and "intercepted" as possible; but I think, for all that, there is something in architecture higher than sanitary engineering. I wish to consider it in these lectures as what I think it essentially is what it has evidently been in the eyes of all those of past days who have produced what we now regard as great architectural monuments—namely, as an intellectual art, the object of which is to so treat the buildings which we are obliged to raise for shelter and convenience as to render them objects of interest and beauty, and not mere utilitarian floors, walls, and roofs to shelter a race who care nothing for beauty, and who only want to have their physical comfort provided for.

Architecture, then, from the point of view from which I am asking you to regard it—and the only point of view in which it is worth the serious regard of thoughtful people —is the art of erecting expressive and beautiful buildings. I say expressive and beautiful, and I put expressive first, because it is the characteristic which we can at least realize even when we cannot realize what can fairly be called beauty, and it is the characteristic which comes first in the order of things. A building may be expressive and thereby have interest, without rising into beauty; but it

thereby have interest, without rising into beauty; but it can never be, architecturally speaking, beautiful unless it has expression. And what do we mean by expression in a building? That brings us to the pith of the matter.

We know pretty well what we mean when we say that a painted or sculptured figure is expressive. We mean that, while correctly representing the structure of the human figure, it also conveys to our minds a distinct idea of a special emotion or sentiment such as human beings are capacial emotion or sentiment, such as human beings are capa-ble of feeling and expressing by looks and actions. Ex-pression in this sense a building cannot be said to have. It is incapable of emotion, and it has no mobility of sur-face or feature. Yet I think we shall see that it is capable of expression in more senses than one. It may, in the first place, express or reflect the emotion of those signed it, or it may express the facts of its own internal structure and arrangement. The former, however, can only, I think, be said to be realized in the case of architecture of the higher class, and when taken collectively as a typical style. For instance, we can all pretty well agree a typical style. For instance, we can all pretty well agree that the mediæval cathedral expresses an emotion of aspiration on the part of its builders. The age that built the cathedrals longed to soar in some way, and this was the way then open to it, and it sent up its soul in spreading vaults, and in pinnacles and spires. So also we can never look at Greek architecture without seeing in it the reflection of a nature refined, precise, and critical; loving grace and finish, but content to live with the graces and the muses without any aspirations that spurned this earth. We can hardly go further than this in attributing emotional expression to architecture. But in a more restricted sense of the word expression, a building may express very definitely its main constructive facts, its may express very definitely its main constructive facts, its plan and arrangement, to a certain extent even its purpose, so far at least that we may be able to identify the class of structure to which it belongs. It not only may, but it ought to do this, unless the architecture is to be a mere ornamental screen for concealing the prosaic facts of

* Cantor lecture before Society of Arts, from the Journal of the Society of Arts.

the structure. There is a good deal of architecture in the world which is, in fact, of this kind—an ornamental screen unconnected with the constructional arrangement of the building; nor is such architecture to be entirely of the building; nor is such architecture to be entirely scouted; it may be a very charming piece of scenery in itself, and you may even make a very good theoretical defence for it, from a certain point of view; but, on the whole, architecture on that principle becomes uninteresting; you very soon tire of it; it is a mask rather than a countenance, and tends to the production of a dull uniformity of conventional design.

For we must remember that architecture, although a form of artistic expression, is not, like painting and sculpture, unfettered by practical considerations; it is an art inextricably bound up with structural conditions and practical requirements. A building is erected first for convenience and shelter; secondly only for appearance, except in the case of such works as monuments, triumphal arches, the which represent architectural effect pure and simple in the case of such works as monuments, triumphal arches, etc., which represent architectural effect pure and simple, uncontrolled by practical requirements. With such exceptions, therefore, a building ought to express in its external design its internal planning and arrangement; in other words, the architectural design should arise out of the plan and disposition of the interior, or be carried on concurrently with it, not designed as a separate problem. Then a design is dependent on structural conditions also, and if these are not observed the building does not stand, and hence it is obvious that the architectural design must and hence it is obvious that the architectural design must express these structural conditions; it must not appear to stand, or be constructed in a way in which it could not stand (like the modern shops which are supposed to stand on sheets of plate-glass), and its whole exterior appearance ought to be in accordance with, and convey the idea of, ought to be in accordance with, and convey the idea of, the manner and principle on which it is constructed. The most important portions of the interior must be shown as such externally by the greater elaboration and emphasis of their architectural treatment. If the general arrangement of the plan is symmetrical, on either side of a centre (which, however, it cannot often be, except in the largest type of monumental or public buildings), the architectural treatment must be symmetrical; if the building is necessarily arranged, in accordance with the requirements of the plan unsymmetrically, the architectural treatment must the plan unsymmetrically, the architectural treatment must follow suit, and the same principle must be carried out through all the details.

Now this dependence of architectural design unon plan

low this dependence of architectural design upon plan and construction is one of the conditions which is often overlooked by amateurs in forming a judgment upon architectural design; and the overlooking of this is one reason of the uncertainty of opinion about architecture as compared with such arts as sculpture and painting. Few people know or care much about the structure and planpeople know or care much about the structure and planning of buildings except those whose business it is to care about this; and consequently they do not realize what it is which they should look for in the architectural design. They like it or do not like it, and they regard this as what is called a mere question of taste, which, according to the proverb, is not to be disputed about. In fact, however, the good or bad taste of an architectural design, say, if you like, its correctness or incorrectness, is to a considerable extent a matter of logical reasoning, of which you must accurately know the premises before you can form a must accurately know the premises before you can form a just conclusion. But there is another reason for this prevjust conclusion. But there is another reason for this prevalent uncertainty and vagueness of opinion, arising out of the very nature of architectural art itself, as compared with the imitative arts. A painting of a figure on a landscape is primarily a direct imitation of the physical facts of nature. I do not for a moment say it is only that, for there is far more involved in painting than the imitation of nature; but the immediate reference to nature does give a standard of comparison which to a certain event give a standard of comparison which to a certain extent every eye can appreciate. But architecture is not an art which imitates natural forms at all, except as minor deco-rations, and it then does so, or should do so, only in a conventionalized manner, for reasons which we shall consider later on. Architecture is, like music, a metaphysical art; it deals with the abstract qualities of proportion, balance of form, and direction of line, but without any imitation of the concrete facts of nature. The comparison between architecture and music is an exercise of the fancy tion of the concrete facts of nature. The comparison between architecture and music is an exercise of the fancy which may indeed be pushed too far, but there is really a definite similarity between them which it is useful to notice. For instance, the regular rhythm, or succession of accentuated points in equal times, which plays so important a part in musical form, is discernible in architecture as a rhythm in space. We may treat a cottage type of design, no doubt, with a playful irregularity, especially if this follows and is suggested by an irregularity of plan; but in architecture on a grand scale, whether it be in a Greek colonnade or a Gothic arcade, we cannot tolerate irregularity of spacing, except where some constructive necessity affords an obvious and higher reason for it. Then, again, we find the unwritten law running throughout all architecture that a progress of line in one direction requires to be stopped in a marked and distinct manner when it has run its course, and we find a similarly felt necessity in regard to musical form. The repetition so common at the close of a piece of music of the same chord several times in succession, is exactly analogous to the common at the close of a piece of music of the same chord several times in succession, is exactly analogous to the repetition of cross lines at the necking of a Doric column to stop the vertical lines of the fluting, or to the strongly-marked horizontal lines of a cornice which form the termination of the height or upward progress of an architectural design. The analogy is here very close. A less close analogy may also be felt between an architectural and a musical composition regarded as a whole. A fugure of musical composition regarded as a whole. A fugue of Bach's is really a built-up structure of tones (as Browning has so finely put it in his poem, "Abt Vogler"), in

accordance with certain ideas of relation and proportion accordance with certain ideas of relation and proportion, just as a temple or a cathedral is a built-up structure of lines and spaces in accordance with ideas of relation and proportion; both appeal to the same sense of proportion and construction in the brain, the one through the ear, the other through the eye. Then, in regard to architecture again, we have further limiting conditions arising not only again, we have further limiting conditions arising not only out of the principle of construction employed, but out of the physical properties of the very material we employ. A treatment that is suitable and expressive for a stone construction is quite unsuitable for a timber construction; details which are effective and permanent in marble are ineffective and perishable in stone, and so on; and the outcome of all this is that all architectural design has to outcome of all this is that all architectural design has to be judged not by any easy and ready reference to exterior physical nature, with which it has nothing to do, but by a process of logical reasoning as to the relation of the design to the practical conditions, first, which are its basis, and as to the relation of the parts to each other. Of course, beyond all this, there is in architecture, as in music, something which defies analysis, which appeals to our sense of delight we know not how or why, and probably we do not want to know; the charm might be dissolved if we did. But up to this point architectural design and expression are based on reasoning from certain premises; the design are based on reasoning from certain premises; the design is good or bad as it recognizes or ignores the logic of the case, and the criticism of it must rest on a similar basis. It is a matter of thought in both cases, and without thought it can neither be designed nor appreciated to any purpose, and this is the leading idea which I wish to urge and to illustrate in these lectures.

You may say, may not a design satisfy all these logical conditions, and yet be cold and uninteresting, and give one no pleasure? Certainly it may; indeed, we referred just now to that last element of beauty which is beyond analysis; but if we cannot analyze the result, I rather think we can express what it is which the designer must express beyond clear reasoning to give the highest interest think we can express what it is which the designer must evince, beyond clear reasoning, to give the highest interest to his architecture. He must have taken pleasure and interest in it himself. That seems a little thing to say, but much lies in it. As Matthew Arnold has said of poetry:

"What poets feel not, when they make A pleasure in creating, The world, in its turn, will not take Pleasure in contemplating."

The truth runs through all art. There are, alas! so many people who do not seem to have the faculty of tak-ing pleasure; and there is so much architecture about our many people who do not seem to have the faculty of taking pleasure; and there is so much architecture about our streets which it is impossible to suppose any one "took pleasure in creating." When a feature is put into a design not because the designer liked it, but because it is the usual thing and it saves trouble, it always proclaims that melancholy truth. But where something is designed because the designer liked doing it, and was trying to please his own fancy instead of copying what a hundred other men have done before, it will go hard, but he will give some pleasure to the spectator. It is from this blessed faculty that a design becomes inspired with what is best described as "character." It is not the same thing as style. I have something to say in my next lecture as to what I think style means; but it is certain that a building may have style and yet want character, and it may have a good deal of character and yet be faulty or contradictory in style. We cannot define "character," but when we feel that it is present we may rely upon it that it is because the designer took interest and pleasure in his work; was not doing it merely scholastically—in short, he put something of his own character into it; which means that he had some to put.

Now, coming back to the axiom before mentioned, that architectural design should everees and emphasize the

had some to put.

Now, coming back to the axiom before mentioned, that architectural design should express and emphasize the practical requirements and physical conditions of the building, let us look a little more in detail into the manner in which this may be done. We will take, to begin with, the very simplest structure we can possibly build—a plain wall. Here there is no expression at all; only stones piled one on another, with sufficient care in coursing and jointing to give stability to the structure. It is better for the wall—constructively, however—that it should have a wider base, to give it more solidity of foundation, and that jointing to give stability to the structure. It is better for the wall—constructively, however—that it should have a wider base, to give it more solidity of foundation, and that the coping should project beyond the face of the wall, in order to throw the rain off, and these two requirements may be treated so as to give architectural expression to our work. It now consists of three distinct portions—a plinth, or base, a superficies of wall, and a coping. 4We will mark the thickening at the base by a molding, which will give a few horizontal lines, and the coping in the same way. The molding of the coping must also be so designed as to have a hollow throating, which will act as a drip, to keep the rain from running down the under side of the coping and down the wall. We may then break up the superficies by inserting a band of single ornament in one course of this portion of the wall; not half-way, for to divide any portion of the building into mere "halves" has usually a weak and monotonous effect, but about two-thirds of the distance from the base line, and this band of ornament not only breaks up the plain surface a little, but also, by carrying another horizontal line along the wall, emphasizes its horizontality. Always emphasize that which is the essential characteristic of your structure. A wall of this kind is essentially a long horizontal boundary; emphasize its length and horizontality. If we are millionaires, and can afford to spend a great deal on a wall, we may not only carry further the treatment of the coping and base, by giving them ornamental adjuncts as well as moldings, but we might treat the whole wall-superficies as a ornament not only breaks up the plain surface a little, but also, by carrying another horizontal line along the wall, emphasizes its horizontality. Always emphasize that which is the essential characteristic of your structure. A wall of this kind is essentially a long horizontal boundary; emphasize its length and horizontality. If we are millionaires, and can afford to spend a great deal on a wall, we may not only carry further the treatment of the coping and base, by giving them ornamental adjuncts as well as moldings, but we might treat the whole wall-superficies as space for surface carving, not mechanically repeated, but

with continual variation of every portion, so as to render with continual variation of every portion, so as to render our wall a matter of interest and beauty while retaining all its usefulness as a boundary, observing that such surface ornament should be designed so as to fulfill a double object, (1st) to give general relief to the surface of the wall; (2d) to afford matter of interest to the eye on close inspection and in detail. That is the double function of nearly all architectural ornament; it is, in the first place, to aid the general expression and balance of the building, and give point and emphasis where needed; and in the second give point and emphasis where needed; and, in the second place, to furnish something to the eye for study on its own account when viewed more closely.

We will take another typical and simple erection, a stone pillar to support the ends of two lintels or beams. This may be simply a long squared piece set on end, and will perform its constructive functions perfectly well in that form; but it is not only absolutely expressionless, but is in one sense clumsy and inconvenient, as taking up more space than need be, presenting an unwieldy-looking mass when viewed at an angle, and shutting out a good deal of light (if that happens to be a matter of consequence in the case). Cutting off the angles does not weaken it much, and renders it much less unwieldy-looking, besides giving it a certain degree of verticality of expression, and render-ing it more convenient as taking up less room and obstruct-ing less light. But though the column is quite strong ing less light. But though the column is quite strong enough, the octagonal top does not make so good a seat or bearing for the ends of the lintels; we will therefore put a flat square stone on the top of it which will serve as a bed for the lintels to rest on securely. But the angles of this bed-plate, where they project beyond the face of the column, appear rather weak, and are so actually to some extent—a double defect, for it is not enough in architecture that their appeals to the strong account it is necessarily to the strong account to the strong account the strong accou ure that a thing should be strong enough, it is necessary that it should appear so, architecture having to do with ex-pression as well as with fact. We will, therefore, strengthen this projecting angle, and correct the abrupt-ness of transition between the column and the bed-plate ness of transition between the column and the bed-plate by brackets projecting from the alternate faces of the column to the angles of the bed-plates. As this rather emphasizes four planes of the octagon column at the expense of the other four, we will bind the whole together just under the brackets by a thin band of ornament constituting a necking, and thus we have something like a capital developed, a definitely designed finish to our column, expressive of its purpose. This treatment of the upper end would make the lower end rising abruptly from the ground seem very bare. We will accordingly emphasize the base of the column, just as we emphasized the base of the wall, by a projecting molding, not only giving size the base of the column, just as we emphasized the base of the wall, by a projecting molding, not only giving expression to this connection of the column with the ground, but also giving it the appearance, and to some extent the reality, of greater stability, by giving it a wider and more spreading base to rest on. We have here still left the lines of one column vertically parallel, and there is no constructive reason why they should not remain so; there is, however, a general impression to the eye both of greater stability and more grace arising from a slight diminution upward. It is difficult to account for this on any metaphysical principle, but the fact has been felt by most nations which have used a columnar architecture, and we will accept it and diminute (so to speak) our colmost nations which have used a columnar architecture, and we will accept it and diminute (so to speak) our column. We have here taken a further step by treating the shaft of the column in two heights, keeping the lower portion octagonal and reducing the upper portion to a circle, and we now find it easier to treat the capital so as to have a direct and complete connection with the column, the capital being here merely a spreading out of the column into a bracket form all round, running it into the square of the bed-plate.* The spreading portion is emphasized by surface ornament, and the necking is again emphasized, this time more decisively, by a molding, forming a series of parallel rings round the column. If we wish to give our column an expression of more grace and elegance, we can further reduce the thickness of it and give more spread to the capital, always taking care to be sure that spread to the capital, always taking care to be sure that the strengh of the column is not reduced below what the weight which it has to carry requires. In this case a bracket is shown above the capital, projecting longitudinally only (in the direction of the lintel bearing), a method nally only (in the direction of the lintel bearing), a method of giving a larger bearing-surface for the ends of the lintels, shortening their actual bearing† (in other words, widening the space which can be bridged between column and column), and giving a workmanlike appearance of stability to the construction at this point. The idea of the division of the column into two sections, suggested in Fig. 8, is kept up in Fig. by treating the lower portion up to the same height into two sections, suggested in Fig. 8, is kept up in Fig. 9, by treating the lower portion, up to the same height with incised decorative carving. The dotted lines on each side in Fig. 9 give the outline of the original square column as shown in Fig. 4. The finished column was within that block; it is the business of the architectural designer to get it out. \(\frac{1}{2}\)

Let us see if we can apply the same kind of process of evolving expression in regard to a building. We will take again the very simplest form of building (Fig. 10), a square house with a door in the centre and uniform rows

There cannot be said to be any architectural expression in this; there is no base or plinth at all, no treatment of the wall; the slight projection at the eaves is only what is necessary to keep the rain from running down the walls, and facilitate the emptying of the gutters, down the walls, and facilitate the emptying of the gutters, and the even spacing of the windows is essential for constructive reasons, to keep the masses of wall over each other, and keep the whole in a state of equally balanced pressure. The first thing we should do in endeavoring to give some expression to the building would be to give it a base or plinth (Fig. 11), and to mark that and the cornice a little more decidedly by moldings and a line of paneling at the plinth. The house being obviously in three stories, we should give it some echo externally of this division into horizontal stages by horizontal moldings, what are called we should give it some echo externally of this division into horizontal stages by horizontal moldings, what are called in architectural phraseology, "string courses," not necessarily exactly at the floor-levels, but so as to convey the idea of horizontal division; observing here, as in the case of the wall and column, that we should take care not to divide the height into equal parts, which is very expressionless. In this case we will keep the lower string close down on the ground-floor windows, and keep these rather low, thus showing that the ground-floor apartments are not the most important; while the fact that the first floor ones are so is conversely made apparent by keeping these not the most important; while the fact that the first floor ones are so is conversely made apparent by keeping these windows rather higher, putting a double string-course over them, and a slight extra depth of molding, forming a kind of cornice over each. The space left between these and the roof, in which the attic windows are placed, is treated with a series of mullions and panelings, into which the attic windows are worked, as part of the series of openings; this gives a little richness of effect to the top story, and a continuity of treatment, which binds the whole series of windows together. To have treated the whole of the walls and windows in this way would have been merely ings; this gives a little richness of effect to the top story, and a continuity of treatment, which binds the whole series of windows together. To have treated the whole of the walls and windows in this way would have been merely throwing away labor; what little effect it has consists in the "character" given by the contrast of this top story treatment with the plain wall surfaces below. The last thing is to emphasize the door, as the principal opening in the walls, and quite distinct in use and meaning from the other openings, by giving it a little architectural frame or setting, which may be done in many ways, but in this case is done by the old-fashioned device (not very logical certainly) of putting a little entablature over it, and a column on either side. There is, however, this to be said for it, that the projecting tablature forms a semi-porch, protecting those at the door somewhat from rain; it must be carried in some way, and columns are the readiest and most seemly manner of doing it, and they also form, practically, something of a weather screen; the bases on which they stand also form a frame-work or enclosing wall for the steps, which are thus made part of the architectural design, instead of standing out as an eyesore, as on Fig. 10. We have now given the house a little general expression, but it still is vague in its design as far as regards the distribution of the interior; we do not know whether the sion, but it still is vague in its design as far as regards the distribution of the interior; we do not know whether the first floor, for instance, is one large room, or two or more first floor, for instance, is one large room, or two or more rooms, or how they are divided; and the little house is very square and prim in effect. Let us try grouping the windows a little, and at the same time breaking up the flat surface of the front wall (Fig. 12). Here as before, we have divided the building by a horizontal string, but only by one main one on the first floor level, keeping the same contrast, however, between a richer portion above and a plainer portion below; we have divided the building vertically, also, by two projecting bays finishing in gables, thus breaking also the skyline of the roof, and giving it a little picturesqueness, and we have grouped the windows. little picturesqueness, and we have grouped the windows, instead of leaving them as so many holes in the wall at equal distances. The contrast between the ground and first floor windows is more emphatic; and it is now the more evident that the upper floor rooms are the best apart-ments, from their ample windows; it is also pretty evident that the first floor is divided into two main rooms with large bay windows, and a smaller room or a staircase window between them; the second floor windows are also dow between them; the second floor windows are also shifted up higher, the two principal ones going in to the gables, showing that the rooms below them have been raised in height. Windows carried up the full height of these rooms, however, might be too large either for repose internally, or for appearance externally, so the wall intervening between the top of these and the sill of the gables is a good field for some decorative treatment, confined to the bays, so as to assist in separating them from the straight wall which forms the background to them.

So far we have treated our building only as a private house. Without altering its general scale and shape, we may suggest something entirely different from a private house. On Fig. 13, we have tried to give a municipal appearance to it, as if it were the guildhall of a small country town. The plain basement and the wide principal doorway, and the row of three very large equal spaced windows above, render it unquestionable that this is a building with a low ground story, and one large room above; a certain the strain of the strain

So far we have treated our building only as a private house. Without altering its general scale and shape, we may suggest something entirely different from a private house. On Fig. 13, we have tried to give a municipal appearance to it, as if it were the guildhall of a small country town. The plain basement and the wide principal doorway, and the row of three very large equal spaced windows above, render it unquestionable that this is a building with a low ground story, and one large room above; a certain "public building" effect is given to it by the large and enriched cornice with balustrade above and paneling below, and by the accentuation of the angles by projecting piers, and by the turrets over them, which give it quite a different character from that of a private house. If, on the other hand, the building were the free library and reading-room of the same small country town, we should have little doubt of this, if we saw it as in Fig. 14, with the walls all blank (showing that they are wanted for ranging something against, and cannot be pierced for windows), and windows only in the upper portion. Similarly, if we want to build it as the country bank, we should have to put the large windows on the ground floor, bank clerks wanting plenty of light, and the ground story being always the

principal one; and we might indulge the humor of giving it a grim fortress-like strength by a rusticated plinth $(i.\ e.,\ \text{stones}\ \text{left}$ or worked rough and rock-like), and by very massive piers between the windows, and a heavy cornice over them; the residential upper floor forming a low story subordinate to the bank story. It is true this would not satisfy a banker, who always wants classic pilasters stuck against the walls, that being his hereditary idea of bank expression in architecture.

bank expression in architecture.

Now, if we proceed to take to pieces the idea of architectural design, and consider wherein the problem of it consists, we shall find that it falls into a fourfold shape. It consists first in arranging the plan; secondly, in carrying up the boundary lines of this plan vertically in the shape of walls; thirdly, in the method of covering in the space which we have thus defined and enclosed; and, fourthly, in the details of ornamentation which give to it the last and concluding grace and finish. All building, when it gets beyond the mere wall with which we began, is really a method of covering in a space, or, if we may put it so, a collection of spaces, marked out and arranged for certain purposes. The first thing that the architect has to do is to arrange these spaces on the ground so that they may conveniently meet the necessary requirements of the building. Convenience and practical usefulness come first; but in any building which is worth the name of architecture something more than mere convenience has to be kept in mind, even in the arrangement of the plan upon the site. It is to be a combination of convenience with effectiveness of arrangement. We shall probably find that some one compartment of the plan is of paramount importance. We have to arrange the interior so that this most important compartment shall be the climax of the plan.

The entrance and the other subsidiary compartments must be kept subordinate to it, and must lead up to it in such a manner that the spectator shall be led by a natural gradation from the subsidiary compartments up to the main one, which is the centre and raison d' etre of the wholeonc, which is the centre and ration a letter of the whole—
everything in the lines of the plan should point to that.
This is the great crux in the planning of complicated public buildings. A visitor to such a building, unacquainted with it previously, ought to have no difficulty in finding out from the disposition of the interior which are the main out from the disposition of the interior which are the main lines of route, and when he is on the line leading him up to the central feature of the plan. There are public buildings to be found arranged on what may be called the rabbit-warren system, in which perhaps a great number of apartments are got upon the ground, but which the visitor is obliged laboriously to learn before he can find his way hout them. They is not only incorporates, but insartistic about them. That is not only inconvenient, but inartistic planning, and shows a want of logic and consideration, and, in addition to this, a want of feeling for artistic effect. and, in addition to this, a want of feeling for artistic effect.

I saw not long ago, for instance, in a set of competitive designs for an important public building, a design exhibiting a great deal of grace and elegance in the exterior architectural embellishment, but in which the principal entrance led right up to a blank wall facing the entrance, and the spectator had to turn aside to the left and then to the right before finding himself on the principal axis of the plan. That is what I should call inartistic or unarchitectural That is what I should call inartistic or unarchitectural planning. The building may be just as convenient when you once know its dodges, but it does not appear so, and it loses the great effect of direct vista and climax. An able architect, who had given much thought to a plan of a large building of this kind, said to me, in showing me his plan, with a justifiable gratification in it: "It has cost me and less trouble, but, it is a satisfaction to feel that you endless trouble, but it is a satisfaction to feel that you have got a plan with backbone in it." That is a very good expression of what is required in planning a compligood expression of what is required in planning a complicated building, but few outsiders have any notion of the amount of thought and contrivance which goes to the production of a plan "with backbone;" a plan in which all the subordinate and merely practical departments shall be in the most convenient position in regard to each other, and yet shall all appear as if symmetrically and naturally subordinate to the central and leading feature; and if the public had a little more idea what is the difficulty of producing such a plan they would perhaps do a little more public had a little more idea what is the difficulty of producing such a plan, they would perhaps do a little more justice to the labors of the man who contrives the plan, which they think such an easy business; and no doubt it may appear an easy business, because the very characteristic of a really good plan is that it should appear as if it were quite a natural and almost inevitable arrangement. Just as it is said in regard to literature, that easy writing is hard reading, so, in regard to planning, it is the complicated and rabbit-warren plans that are the easiest to make, because it is just doing what you please; it is the apparently perfectly simple and natural plan which springs apparently perfectly simple and natural plan which springs from thought and contrivance. Then there is the next step of raising the walls on the plan, and giving them architectural expression. This must not be thought of as an entirely separate problem, for no truly architectural intellect will ever arrange a plan without seeing generally, in his mind's eye, the superstructure which he intends to rear upon it; but the detailed treatment of this forms a separate branch of the design. Then comes the third and very important problem, the covering in of the space. Next to the plan this is the most important. All building is the covering over of a space, and the method of covering it over must be foreseen and provided for from the outset; it largely inof a space, and the method of covering it over must be foreseen and provided for from the outset; it largely influences the arrangement of the plan. If there were no roofing you could arrange the walls and carry them up pretty much as you chose, but the roofing of a large space is another matter; it requires extra strength at certain points, where the weight of the roof is concentrated, and it has to be determined whether you will employ a method of roofing which exercises only a vertical pressure on the

walls, llke the lid of box, or one which, like an arch, or a vault, or a dome, is abutting against the walls, and requires counterforts to resist the outward thrust of the roof. We shall come upon this subject of the influence of the roof on the design of the substructure more in detail later on. Then, if the plan is convenient and effective, the walls carried up with the architectural expression arising from the placing and grouping of the openings, and the proper emphasizing of the base and cornice, and the horizontal stages (if any) of the structure, and the roof firmly and scientifically seated on the walls; after all these main portions of the structure are designed logically and in accordance with one another, and with the leading idea of the building, then the finishing touches of expression and interest are given by well designed and effective ornamental detail. Here the designer may indulge his fancy as he pleases, as far as the naure of the design is concerned, but not, if you please, as far as its positions and distribution are concerned. There the logic of architecture still pursues us. We may not place ornament anywhere at haphazard on a building simply because it looks pretty; at least, to do so is to throw away great part of its value. For everything in architectural design is relative; it is to be considered in relation to the expression and design of the whole, and ornament is to be placed where it will emphasize certain points or certain features of the building. It must form a part of the grouping of the whole, and be all referable to a central and predominating idea. A building so planned, built, and decorated, becomes in fact what all architecture—what every artistic design in fact should be—an organized whole, of which every part has its relation to the rest, and from which no feature can be removed without impairing the unity and consistency of the design. You may have a very good, even an expressive building, with no ornament at all if you like, but you may not have misplaced ornament; t

I have thought that it would be of use to those who are unacquainted with architectural procedure in delineating architecture by geometrical drawings, if I took the opportunity of illustrating very briefly the philosophy of elevations, plans, and sections, which many non-professional people certainly do not understand. A simple model of a building, like that in Fig. 16, will serve the purpose, as the principle is the same in the most complicated as in the simplest building. It must be remembered that the object of architectural drawings on the geometrical system is not to show a picture of the building, but to enable the designer to put together his design accurately in all its parts, according to scale, and to convey intelligible and precise information to those who have to erect the building. A perspective drawing like Fig. 16 is of no use for this purpose. It shows generally what the design is, but it is impossible to ascertain the size of any part by scale from it, except that if the length of one line were given it would be possible, by a long process of projection and calculation, to ascertain the other sizes. The rationale of the architect's geometrical drawings is that on them each plane of the building (the front, the side, the plan, etc.), is shown separately and without any distortion by perspective, and in such a manner that every portion is supposed to be opposite to the eve at once. Only the width of any I have thought that it would be of use to those who are tive, and in such a manner that every portion is supposed to be opposite to the eye at once. Only the width of any object on one side can be shown in this way at one view; for the width of the return side you have to look on another drawing; you must compare the drawings in order to find out those relative proportions which the perspective view out those relative proportions which the perspective view indicates to the eye at a glance; but each portion of each side can be measured by reference to a scale, and its precise size obtained, which can only be guessed at roughly from the perspective drawing. Thus the side of the model is shown in Fig. 19, the end in Fig. 17; the two together give the precise size and proportions of everything outside to scale, except the projection of the pilasters; this has to be got at from the plan and section. Everything being drawn on one plane, of course surfaces which are sloping on one elevation are represented as flat in the other: for on one elevation are represented as flat in the other; for instance, on No. 17, the raking line of the sloping roof is shown at N, so we know the slope of the stoping roof is shown at N, so we know the slope of the roof, but we do not know to what length it extends the other way. This is shown on Fig. 19, where the portion showing the roof is also marked N, and it will be seen that the surface, which is sloping in Fig. 17, is seen in the side elevation only as is sloping in Fig. 17, is seen in the side elevation only as a space between a top and bottom line; we see the length of the roof here, and its height, but for its slope we go to the end elevation. Neither elevation tells us, however. what is inside of the building; but the section, Fig. 18, shows us that it has an arched ceiling, and two stories, a lower and a higher one. The section is the building cut in half, showing the end of the walls, the height and depth of the window openings, the thickness of the floor, etc., and as all parts which are opposite the eye are shown in the drawing, the inside of the cross-wall at the end of the building is shown as a part of the section drawing, he and as an parts which are opposite the cyc are shown in the drawing, the inside of the cross-wall at the end of the building is shown as a part of the section drawing, between the sectional walls. In Fig. 23 the section is sketched in perspective, to show more clearly what it means. Another section is made lengthways of the building, Fig. 20. It is customary to indicate on the plan the dotted lines the portion through which the section is supposed to be made: thus on the plans the lines A B and C D are drawn, and the corresponding sections are labeled with the same lines. As with the elevation, one section must be compared with another to get the full information from them. Thus in Fig. 18, the ceiling M, is shown as a semicircle; in Fig. 20 it is only a space between the top and bottom line; it is, certainly, shaded here to give the effect of rotundity, but that is quite a superfluity. On Fig. 18 the height of the side windows

Digitized by Google

is shown at F, and the thickness of the wall in which they is shown at F, and the thickness of the wall in which they are made; in Fig. 20, F, their width and spacing are shown. In Fig. 18 some lines drawn across, one over the other, are shown at H; these are the stairs, of which in this section we see only the fronts, or risers, so that they apsection we see only the fronts, or risers, so that they appear merely as lines (showing the edge of each step) drawn one over the other. At H on the plan, Fig. 21, we again see them represented as a series of lines, but here we are looking down on the top of them, and see only the upper surfaces or "treads," the edges again appearing as a series of lines. At H on the longitudinal section, we see the same steps in section, and consequently their actual slope, which, however, could have been calculated from Figs. 18 and 21, by putting the heights shown in section with the width shown in plan. The plan, Fig. 21, shows the thickness and position on the floor of the pillars G G; their height is shown in the sections. The plan of a building is merely a horizontal section, cutting off the top, and looking down on the sectional top of the walls, so as to see all their thicknesses. I have drawn (Fig. 24) a to see all their thicknesses. I have drawn (Fig. 24) a perspective sketch of one end of the plan (Fig. 22) of the building, on the same principle as was done with the section (Fig. 23), in order to show more intelligibly exactly what it is that a plan represents—the building with the pages lifted of

upper lifted off.

Returning for a moment to the subject of the relation between the plan and the exterior design, it should be noted that the plan of a building being practically the first consideration, and the basis of the whole design, the latter consideration, and the basis of the whole design, the latter should be in accordance with the principle of disposition of the plan. For example, if we have an elevation (shown in diagram) showing two wings of similar design on either side of a centre, designed so as to convey the idea of a grand gallery, with a suite of apartments on either side of similar importance, if the one side only of the plan con-tains such a suite, and the opposite side is in reality divided up into small and inferior rooms, filled in as well as may be behind the architectural design, the whole design is in that case only a blind or screen, giving a false exterior symmetry to a building which is not so planned. This is an extreme case, or might be called so if it were not actually of pretty frequent occurrence; but it illustrates in a broad sense a principle which must be carried out in all cases, if the architecture is to be a real expression of the facts of the building

cases, if the architecture is to be a real expression of the facts of the building.

In this lecture, which is concerned with general principles, a word may fittingly be said as to the subject of proportion, concerning which there are many misapprehensions. The word may be, and is, used in two senses: first in regard to the general idea suggested in the words "a well-proportioned building." This expression, often vaguely used, seems to signify a building in which the balance of parts is such as to produce an agreeable imvaguely used, seems to signify a building in which the balance of parts is such as to produce an agreeable impression of completeness and repose. There is a curious kind of popular fallacy in regard to this subject, illustrated in the remark which used to be often made about St. Peter's, that it is so well-proportioned that you are not aware of its great size, etc.; a criticism which has been slain over and over again, but continues to come to life again. The fact that this building does not show its size is true; but the inference drawn is the very reverse of the truth—one object in architectural is the very reverse of the truth—one object in architectural design is to give full value to the size of a building—even to magnify its apparent size; and St. Peter's does not show its size, because it is ill-proportioned, being merely like a smaller building with all its parts magnified; hence the deception to the eye, which sees details which it is accustomed to see on a smaller scale, and underrates their certual size, which is only to be ascertained by deliberate actual size, which is only to be ascertained by deliberate investigation. This confusion as to scale is a weakness inherent in the classical forms of columnar architecture, inherent in the classical torms of columnar architecture, in which the scale of all the parts is always in the same proportion to each other and to the total size of the building, so that a large Doric temple is in most respects only a small one magnified. In Gothic architecture the scale is the human figure, and a larger building is treated, not by magnifying its parts, but by multiplying them. Had this procedure been adopted in the case of St. Peter's, instead of merely treating it with a columnar order of vast size, with all its details magnified in proportion, we should not have the fault to find with it that it does not produce not have the fault to find with it that it does not produce the effect of its real size. In another sense, the word "proportion" in architecture refers to the system of designing buildings on some definite geometrical system of regulating the sizes of the different parts. The Greeks of regulating the sizes of the different parts. The Greeks certainly employed such a system, though there are not sufficient data for us to judge exactly on what principle it was worked out. In regard to the Parthenon, and some other Greek buildings, Mr. Watkiss Lloyd has worked out a very probable theory, which will be found stated in a paper in the "Transactions of the Institute of Architects." Vitruvius gives elaborate directions for the proportioning of the size of all the details in the various orders; and though we may doubt whether his system is really a correct representation of the Greek one, we can have no doubt that some such system was employed by them. Various theorists have endeavored to show that the system has pre-

that some such system was employed by them. Various theorists have endeavored to show that the system has prevailed of proportioning the principal heights and widths of buildings in accordance with geometrical figures, triangles of various angles especially; and very probably this system has from time to time been applied, in Gothic as well as in classical buildings. This idea is open to two criticisms, however. First, the facts and measurements which have been adduced in support of it, especially in regard to Gothic buildings, are commonly found on investigation to be only approximately true; the diagram of tigation to be only approximately true; the diagram of the section of the building has nearly always, according to my experience, to be "coaxed" a little in order to fit

the theory; or it is found that though the geometrical figure suggested corresponds exactly with some points on the plan or section, these are really of no more importance than other points which might just as well have been taken; the theorist draws our attention to those points in the the theorist draws our attention to those points in the building which correspond with his geometry, and leaves on one side those which do not. Now it may certainly be assumed that any builders intending to lay out a building on the basis of a geometrical figure would have done so with precise exactitude, and that they would have selected the most obviously important points of the plan or section for the geometrical spacing. In illustration of this point I have given (Fig. 25) a skeleton diagram of a Roman arch, supposed to be set out on a geometrical figure. The centre of the circle is on the intersection of lines connectcentre of the circle is on the intersection of lines connecting the outer projection of the main cornice with the perpendiculars from those points on the ground line. This point at the intersection is also the centre of the circle of the archway itself. But the upper part of the imaginary circle beyond cuts the middle of the attic cornice. If the arch was to be regarded as set out in reference to this circle, it should certainly have given the most important line, the top line, of the upper cornice, not an inferior and less important line; and that is pretty much the case with all these proportion theories (except in regard to Greek centre of the circle is on the intersection of lines connectall these proportion theories (except in regard to Greek Doric temples): they are right as to one or two points of the building, but break down when you attempt to apply them further. It is exceedingly probable that many of these apparent geometric coincidences really arise, quite these apparent geometric coincidences really arise, quite naturally, from the employment of some fixed measure of division in setting outbuildings. Thus, if an apartment of somewhere about 30x25 feet is to be set out the builder employing a foot measure naturally sets out exactly thirty feet one way and twenty-five feet the other way; it is easier and simpler to do so than to take chance fractional measurements. Then comes your geometrical theorist and observes that "the apartment is planned precisely in the proportion of six to five;" so it is, but is only the philosophy of the measuring-tape, after all. Secondly, it is a question whether the value of this geometrical basis is so great as has sometimes been argued, seeing that the results of it in most cases cannot be judged by the eye. If, for instance, the room we are in were nearly in the proportion of seven in length to five in width. I doubt whether any of us here could tell by looking at it whether it were truly so or not, or even, if it were a foot out one way or the other, in which direction the excess lay; and if this be the case the advantage of such a geometrical basis must be rather imaginary than real.

Having spoken of plan as the basis of design, I should wish to conclude this lecture by suggesting also, what has never to my knowledge been prominently brought forward,

that the plan itself, apart from any consideration of what we may build up upon it, is actually a form of artistic we may build up upon it, is actually a form of artistic thought, of architectural poetry, so to speak. If we take three such plans as those shown in Figs. 26, 27, and 28, typical forms respectively of the Egyptian, Greek, and Gothic plans, we certainly can distinguish a special imaginative feeling or tendency in each of them. In the Egyptian, which I have called the type of "mystery," the plan continually diminishes as we proceed inwards; in the third great compartment the columns are planted thick and close so as to leave no possibility of seeing through the building except along a single avenue of columns at a time: the gloom and mystery of a deep forest are in it, and the building except along a single avenue of columns at a time; the gloom and mystery of a deep forest are in it, and the plan finally ends, still lessening as it goes, in the small and presumably sacred apartment to which all this series of colonaded halls leads up. In the Greek plan there is neither climax nor anti-climax, only the picturesque feature of an exterior colonnade encircling the building and surrounding a single oblong compartment; it is a rationalistic plan, aiming neither at mystery nor aspiration. In the plan of Rheims (Fig. 28) we have the plan of climax or aspiration; as in the Egyptian, we approach the sacred portion through a long avenue of piers; but instead of narrowing, the plan extends as we approach the shrine. I think it will be recognized, putting aside all considerations of the style of the superstructure on these plans, that each of them in itself represents ure on these plans, that each of them in itself represents a distinct artistic conception. So in the plan of the Pantheon (Fig. 29), this entrance through a colonnaded porch into a vast circular compartment is in itself a great archimeration. tectural idea, independently of the manner in which it is

We may carry out this a little further by imagining a We may carry out this a little further by imagining a varied treatment on plan of a marked-out space of a certain size and proportion, on which a church of some kind, for instance, is to be placed. The simplest idea is to inclose it round with four walls as a parallelogram (Fig. 30), only thickening the walls where the weight of the roof-principals comes. But this is a plan without an idea in it; the central or sacred space at the end is not expressed in the plan, but is merely a railed off portion of the floor. plan, but is merely a railed off portion of the floor; the entrance is utterly without effect as well as without the entrance is utterly without effect as well as without shelter. If we lay out our plan as in Fig. 31, we see that there is now an idea in it. The two towers, as they must evidently be, form an advanced guard of the plan; the recessed central part connecting them gives an effective entrance to the interior; the arrangement in three aisles gives length, the apse at the end incloses and expresses the sacrarium, which is the climax and object of the plan. The shape of the ground, however, is not favorable to the employment of a long or avenue type of plan, it is too short and square; let us rather try a plan of the open-area order, such as Fig. 32. This is based on the short-armed Greek cross, with an open-centre area; again there is an "advanced guard" in the shape of an entrance block with a porch; and the three apses at the end give architectural

emphasis to the sacrarium. Figure 35 is another idea, the special object of which is to give an effect of contrast between the entrance, approached first through a colonnaded portico, then through an internal vestibule, lighted from above, and flanked by rows of small coupled columns: from above, and flanked by rows of small coupled columns; then through these colonnaded entrances, the inner one kept purposely rather dark, we come into an interior expanding in every direction; an effect of strong contrast and climax. If our plot of ground again be so situated that one angle of it is opposite the vista of two or more large streets, there and nowhere else will be the salient angle, so to speak, of the plan, and we can place there a circular porch—which may, it is evident, rise into a tower—and enter the interior at the angle instead of in the centre; not an effective manner of entering as a rule but ourse. not an effective manner of entering as a rule, but quite legitimate when there is an obvious motive for it in the legitimate when there is an obvious motive for it in the nature and position of the site. A new feature is here introduced in the circular colonnade dividing the interior into a central area and an aisle. Each of these plans might be susceptible of many different styles of architectural treatment; but quite independently of that, it will be recognized that each of them represents in itself a distinct idea or invention, a form of artistic arrangement of spaces, which is what "plan," in architectural sense, really means.

PROPOSED BRIDGE OVER THE HUDSON RIVER AT NEW YORK CITY.

As promised in our last issue, we give this week a view of the gigantic suspension bridge over the Hudson River, at New York City, proposed by Mr. Gustav Lindenthal, M. Am. Soc. C. E., and described by him in a paper read before the American Society of Civil Engineers on January 4, and of which we have already given some principal dimensions and leading features.

Further plans and particulars are withheld for the present at the special request of Mr. Lindenthal, so we would only add that there are to be four cables of straight wire of an effective diameter of about forty inches, those of the East River Bridge being something less than sixteen inches in diameter and the same number.

Views of some of the principal metal bridges of the world on the same scale are also given as affording an interesting comparison. They are all taken from the tracing accompanying Mr. Lindenthal's paper.

REPORT OF A SPECIAL COMMITTEE OF THE CHAMBER OF COMMERCE ON IMPROVE-MENT OF THE STREET PAVEMENTS IN THE BUSINESS PART OF THE CITY.

Unanimously adopted at a meeting of the Chamber, held January 5, 1888.

THE special committee appointed by the Chamber of Commerce of New York to confer with the authorities regarding pavements, to which reference has been made in our issue of December 17th, made the following report, which was unanimously adopted with thanks of the Chamber, and the committee continued:

"To the Chamber of Commerce:

"Your committee appointed for the purpose of endeavoring to secure improvement of the pavements in the business part of the city, respectfully report progress as fol-

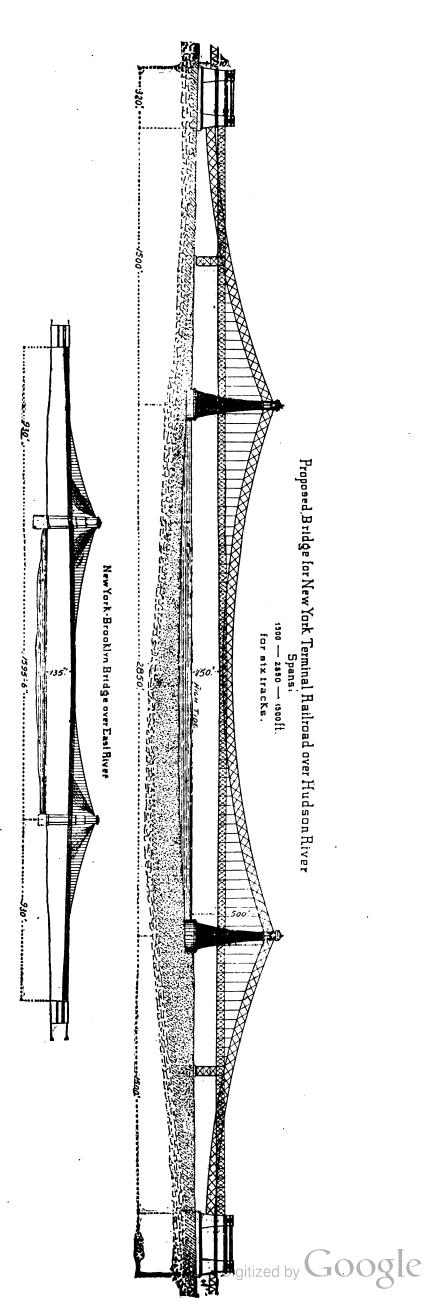

"That they have had an interview with his Honor. Mayor Hewitt, and the Commissioner of Public Works, General Newton; that both of these gentlemen appreciate the value to the whole city of efficient commercial facilities, manifested a hearty interest in the object, and promised all the co-operation in their power; that five hundred thousand dollars (the maximum amount at present permitted by law to be expended in one year by the city upon new pavements) has been appropriated by the Board of Estimate and Apportionment for that purpose, and that the Commissioner of Public Works has promised to confer with your committee regarding where and how this should be expended to obtain the best results.

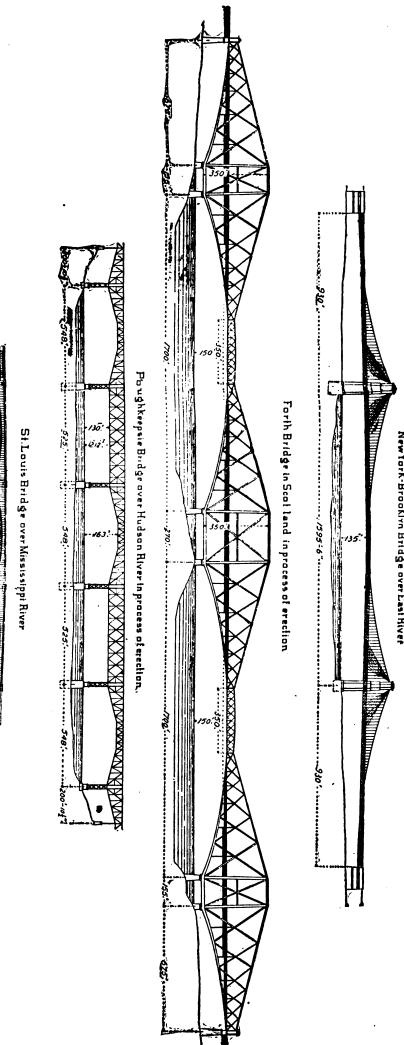

Your committee also had an interview with the officers of the Truckmen's Association, and believe that by a proper co-operation between merchants, truckmen, and other owners of horses and vehicles, results of very great value to the business and real estate interests of this city can, within a reasonable time, be attained. With the little investigation given this subject by your committee, the following facts are clear:

"First.—That our pavements in the business part of this city, upon which its earning power so much depends, are greatly inferior to those of other principal commercial cities of this and other countries with which we have to compete.

"Second.—That the expense of providing an intelligent system of pavements adapted to the heavier or lighter

Digitized by GOOGLE

traffic of the various streets would be comparatively small in proportion to the benefits obtained. From three to five millions of dollars expended during the next three or four years would probably do all that is most needed. The interest on five millions of dollars, at the rate at which the city can borrow capital, would amount to from one hundred and fifty to two hundred thousand dollars annually. It is safe to say that the extra wear and tear upon horses and vehicles occasioned by our present bad pavements is far more than this sum, and this, in turn, is exceeded by the loss incurred through vehicles having to carry, upon the average, one-third smaller loads than they could carry with good pavement. When we add to this the great loss of time, occasioned by bad pavements, both in the movement of freight and of passengers, the aggregate is something

"Third.—It is evident that we must have better regulations governing the opening and replacing of pavements, which is constantly going on for gas, water, and steam connections and repairs, and the arrangement of railway tracks. Under the best municipal administrations of Europe, openings in the pavement are only made by the city authorities, or under their direction, upon the deposit of a sufficient amount to cover the expense of doing the work according to certain well-settled specifications. Street-railways are obliged to use grooved rails laid flush with the pavement, and in Liverpool street-railway tracks are owned and kept in repair by the city, which leases running privileges over them to the various street-car or tramway companies.

"The above regulations as to street openings are quite practicable here, and we propose to advocate such legislation as will give the Department of Public Works any additional authority necessary to that end. As regards our street railways, the city may not be able to own them, but we are assured that legislative authority unquestionably exists to regulate them, so as to compel a due regard for the public safety and convenience. The high centre-bearing rail now in general use by our streetrailways is an outrage upon the rights of other citizens. In the beginning many of the roads used a less objectionable rail; but with the design of making it difficult and dangerous for other vehicles to drive on this part of the street, or cross it, except at right angles, these high and dangerous rails have been introduced. The accidents, strain, and wear and tear to all vehicles have thereby been largely increased, and must necessarily increase with the constant increase of rail mileage. It certainly is not too much to ask from those citizens who have been given most valuable franchises, that they shall use a rail which experience in other cities has demonstrated can be laid without serious detriment to carriers or to the community. While this change cannot be made at once, and should only be made with due regard to the interests of the companies, as well as to those of the public, we recommend that the necessary legislation should be sought to compel such a change within a reasonable time, and that a conference should be had between repretime, and that a conterence should be had between representatives of this Chamber, the municipal authorities, the Truckmen's Association, and the railway companies, to agree, if possible, upon such legislation as will be fair to the public and to the railroads.

"This substitution of rails ought to take place simultaneously with the repavement of streets in which new pavements are to be laid, in order that they may be adjusted to each other.

each other.
"There are a considerable number of streets having a

"There are a considerable number of streets having a large and heavy traffic, which are not likely to be troubled with extensive openings for gas, steam, electricity, or water, which can with great advantage be repayed at once. It is upon such that the present available appropriation should be expended. During the present winter these can be decided upon, specifications can be drawn, and contracts let, so that contractors can make their preparations to execute their contracts during the months suitable for such work. With the experience thus obtained, if the Legislature should permit funds to be provided as above mentioned, much greater progress could be made during the year 1889. The present is a favorable time to make such improvements; materials are low and labor can be obtained at reasonable prices. We have an honest and be obtained at reasonable prices. We have an honest and capable administration of the departments of our city government connected with this work. This inspires government connected with this work. This inspires capital with confidence, and money can be borrowed at low rates to make these improvements, which would add immensely to the value and earning power of our city. We, therefore, recommend that these improvements should We, therefore, recommend that these improvements should be made as soon as possible, and that the requisite authority from the Legislature should be sought at the present session. His Honor, the Mayor, has offered to have a proper bill drawn by the Counsel to the Corporation, and, in the opinion of your committee, such a bill, and the other legislation above mentioned, will have a hearty support from the entire community."

NEW YORK STATE COMPETITION FOR MODEL COUNTRY SCHOOL-HOUSES.

AWARDS TO THE COMPETITORS.

SUPERINTENDENT OF PUBLIC INSTRUCTION DRAPER. of New York State, in September last invited plans in competition for prizes ranging from \$50 to \$150. The invitations for plans suggested six classes, ranging in price from \$600 to \$10,000 for buildings. Mr. Draper selected as the committee to pass upon the drawings and specifications these gentlemen: Ex-State Superintendent William B. Ruggles, Prof. J. W. Kimball, President of the State Teachers' Association; Superintendent Charles E. Gorton. President of the State Council of Superintendents: Principal E. H. Cook, of the Potsdam Normal School; Dr. George A. Bacon, representing the Associated Academic Principals; Willis R. Hall, School Commissioner of the Second District of Chenango County, and Mr. Albert W. Fuller, architect, of the city of Albany.

In his circular Superintendent Draper said: "The movement proposed has been undertaken in the hope that it will result in more attractive and comfortable low-priced school-houses in this State. For reasons which will appear obvious upon reflection there has heretofore been but little done in this direction. At the populous centres the buildings are generally fair, and when new ones are erected they are ordinarily very creditable. But outside of the large communities many of the buildings are truly wretched, erected without any idea of architectural effect, and entirely regardless of those matters upon which the health and comfort of the inmates mostly depend. Old buildings, in a shameful state of decay, are continued in use year after year. When new ones are erected it is considered unnecessary or too expensive to employ professional help, and so the best results are not secured.'

Fifty-eight designs were offered. Of these many were so defective in the matter of lighting, heating, ventilating, design, or general arrangement as to preclude the possibility of a favorable consideration. Of those which met with approval several were decided to be beyond the limit of cost, reckoning materials and labor at the lowest market prices. These plans could, therefore, receive neither prize nor honorable mention, which the committee deemed it was permitted to bestow only on designs strictly conforming to the letter of the instructions contained in Mr. Draper's circular. The prizes were awarded as follows:

Class 1-Six-hundred-dollar building-First prize to William P. Appleyard and Edwyn A. Bowd, of Lansing, Mich.; second prize to John R. Church, of Rochester, N. Y.

-One-thousand-dollar building-First prize to Class 2-William Appleyard and Edwyn A. Bowd, of Lansing, Mich.; second prize to John R. Church, Rochester.

Class 3-Fifteen-hundred-dollar building-First prize, J. C. A. Harriot & Co., Albany.

Class 4-Twenty-five-hundred-dollar building-First prize to William P. Appleyard and Edwyn A. Bowd, Lansing, Mich.; second prize to John R. Church, Roches-

Special commendations are made as follows:

Class 1-Six-hundred-dollar building-To John Cox, Jr., New York City.

Class 2.—One thousand-dollar building—To C. Powell Karr, New York City.

Class 3—Fifteen-hundred-dollar building—To Warren Briggs, Bridgeport, Conn.

-Twenty-five-hundred-dollar building — To

Class 4—Twen Warren R. Briggs. -Five-thousand-dollar building-To Warren R. Briggs, Bridgeport, Conn., and Fenimore C. Bates,

Cleveland, O. Class 6—Ten-thousand-dollar building—To Warren R. Briggs, Bridgeport, Conn., and Proudfoot & Bird, Wichita,

Kan.
Twenty-seven architects competed. No awards were made in class 5—five-thousand-dollar building—and class 6—ten-thousand-dollar building. It is proposed to have the successful plans photographed and available for all who desire copies.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

January 5, 1888.

To Members of the American Society of Civil Engineers: THE undersigned, members of the society, give notice that at the annual meeting on January 18, 1888, they propose to offer the following amendments to the "proposed amendments" to the constitution, for submission to the society. They request that all members who can possibly do so attend the annual meeting and vote upon these

amendments, and that members who cannot be present. send at once to the undersigned or to the secretary of the society, their views on the amendments, to be read in the discussion which will take place on this subject at the annual meeting, and be printed for the information of members-J. J. R. Croes, William R. Hutton, J. F. Flagg, G. Lindenthal, C. C. Schneider, James Archbald.

Amendment as originally offered: (1) Amend Article XVI, of the Constitution by substituting for the present article the following: Constitution. Article XVI, The active members of the society shall be divided into three active members of the society shall be divided into three classes, to be styled respectively members, associate members, and associates, and each person, when duly elected and qualified, shall receive a certificate of membership indicative of the class to which he belongs. Associate numbers shall have all the rights and privileges of members excepting the right to hold office or to vote upon admission to membership or changes in the constitution. admission to membership or changes in the constitution and by-laws of the society. Associates shall have all the rights and privileges of members excepting the right to hold office or to vote. There shall also be a preparatory grade, to be designated students of the society, who shall have the right to receive the transactions of the society and to present papers and written discussions. They shall also have the right to use the library and rooms of the society, and to attend its meetings subject to such regulations and restrictions as the Board of Direction may adopt. Members of the class previously designed admission to membership or changes in the constition may adopt. Members of the class previously designed juniors shall, after March 7, 1888, be classed as associate members.

Proposed amendment of above: Strike out entirely the clause in italics. This society is not an institution for primary education, but is intended to be an association of killed and experienced engineers for mutual improvement by the interchange of ideas and experience of a character more advanced than can be fully understood by novices in the professional work. Admission to any grade of mem-bership should be contingent on experience had and work accomplished and not on the mere desire to learn and the

hope of future benefit by association. Amendment as originally offered: (2) Amend Article XVII. of the Constitution by substituting for the present article the following: Article XVII. A member shall be a civil, military, mining or mechanical engineer, not less than thirty years of age who has been in active practice as such for at least ten years, or has graduated at a school of programs and then in practice as years, and who has such for at least ten years, or has graduated at a school of engineering and been in practice seven years, and who has had responsible charge of work as chief, resident, or superintending engineer for at least two years, not as a skillful workman merely, but as one qualified to design as well as to direct engineering works. An associate member shall be one not less than twenty-four years of age, who has had actual practice in some of the branches of civil, willtary, mining or mechanical engineering for at least five. military, mining or mechanical engineering for at least five years, or has graduated at a school of engineering and been in practice two years and who continues in actual practice at the time of his application for membership. An associate shall be one not less than twenty-five years An associate shall be one not less than twenty-hve years of age, who is a manager of a railroad, canal or other public work; a geologist, chemist or mathematician; a proprietor or manager of a mine or metallurgical works; an architect or a manufacturer; or one who, from his scientific acquirements or practical experience, has attained eminence in his special pursuit, qualifying him to co-operate with engineers in the advancement of professional knowledges. edge; but shall not himself be practicing as an engineer. A student shall be one not less than eighteen, nor more than twenty-seven years of age, who is engaged in the study of engineering with the intent to become an engineer, and who has pursued that study at a technical school not less than one year, or who shall have been engaged in the study and practice of engineering under a competent engineer for not less than two years. A student shall not remain in that grade for more than seven years; if not elected to a higher grade his connection with the society shall terminate at the end of seven years, or upon his attaining the age of twentyseven years.

Proposed amendment of above: Strike out last clause in reference to students for reasons given above. Amend the rest of the article so that it will read as follows: "Article XVII. A member shall be a civil engineer, not less than 30 years of age, who has been in active practice in hydraulic, railroad, mechanical, mining, electrical, topographical, hydrographical, sanitary or military engineering for at least ten years, or has graduated at a school of engineering and been in practice eight years, and who has had responsible charge of work as chief or superintending engineer for at least two years, not as a skillful workman merely, but as one qualified to design as well as to direct engineering works. An associate member shall be one not less than 24 years of age, who has had actual practice in some of the branches of civil engineering for at least five years, or has graduated at a school of engineering and been in practice three years and who continues in actual practice at the time of his application for member-Proposed amendment of above: Strike out last clause actual practice at the time of his application for membership. An associate shall be one not less than 25 years of ship. An associate shall be one not less than 25 years age, who, from his scientific acquirements or practical experience, has attained eminence in his special pursuit, the co-operate with engineers in the perience, has attained eminence in his special pursuit, qualifying him to co-operate with engineers in the advancement of professional knowledge, but shall not be practicing as a civil engineer." (1) The "civil engineer" includes all branches of engineering work. (2) The full period of study at a preparatory school should not be considered as equivalent to the same period of actual practice in the profession.

In the succeeding amendments strike out all clauses re-

In the succeeding amendments strike out all clauses re-lating to the grade of student,

lite.

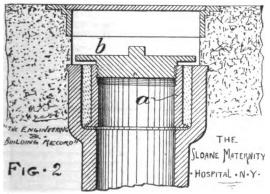

PLUMBING IN THE SLOANE MATERNITY HOSPITAL, NEW YORK.

This building, the gift of Mrs. W. D. Sloane, of New York, is situated on a large plot of ground within which and connecting with it are the College of Physicians and Surgeons and the Vanderbilt Clinic. Each building is isolated and all of the rooms are therefore well supplied with both light and pure air. The material used in constructing the exterior of these buildings is of brick, with terra-cotta trimmings and granite sills and lintels.

The main entrance to Maternity Hospital is from Fiftyninth Street, and the vestibule of this entrance has a wainscot of marble and floor surfaced with the same material. The wainscot in hall on first floor is marble, with white tile surface for floor. The stairs leading to each story have a frame-work of iron, with a tread of slate. The wood trimmings throughout the building are Georgia pine, finished in oil and varnished; but the walls and ceiling have a plain white finish.

The building is heated with steam, which is obtained from the plant located in the college building. Every part of this structure has been built in a thorough, substantial manner.

It is three stories in height, with an attic and basement. There are bath-tubs located on each floor, and all are porcelain, except one in the attic, which is iron, enameled. The laundry-tubs, which are in the basement, and the slop-sinks on each floor above are also porcelain. The basement is accessible from the main floor by a flight of steps within the building, and also by another flight leading direct from sidewalk on Tenth Avenue to basement hall.

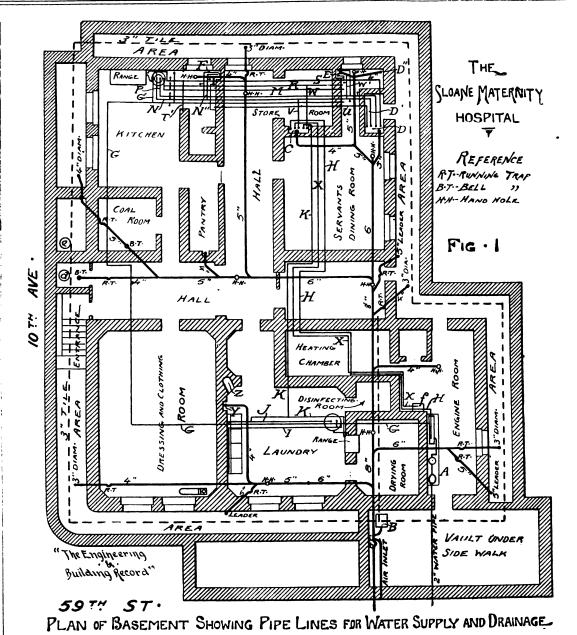

DETAIL OF HAND HOLE COVER FOR SOIL PIPE

A plan of the basement story is shown in Fig. 1. On this floor is located the kitchen, laundry, dressing and clothing room, servants' dining-room, a drying-room, and a disinfecting-room. The kitchen has a wainscot of white-glazed tile, which extends up to the bottom of the windows, and a floor of white unglazed tile laid on concrete. The entire floor in the basement, except the part occupied by kitchen, is constructed of concrete and surfaced with asphalt. The wainscot in the laundry, dressing and clothing room, and servants' dining-room is composed of sand and Portland cement, laid on three-quarters of an inch thick.

An area extends around the entire building, as shown in Fig. 1. This area at the front entrance on Fifty ninth Street, and also at d and e on Tenth Avenue, is covered. All barrels and boxes containing supplies for kitchen and laundry are received through an opening in covered area at d and coal through a similar opening at e. At Z in Figs. 1 and 5 the position of a circular tube or chute 16 inches in diameter is shown. This chute communicates with the hall on second and third floors, with openings protected by iron doors, as shown in Fig. 5; and through these openings all soiled clothing intended for the laundry will be deposited inclosed in bags and passed down to laundry, thereby saving much time and labor that would be necessary if carried down the stairs.

Any clothing that may require disinfecting will then be placed in the disinfecting-room, shown in Fig. 1, where a high degree of heat can be obtained by means of large coils of steam-pires.

The laundry-range shown in Fig. 5 is covered with a shield of galvanized iron which is made in two sections. The rear portion is stationary, but the front can be pushed up or down by means of the handle shown at B'. The position of this shield is indicated by the curved broken lines, but the rear, shown by broken vertical lines, is open, and when shield is turned down the heat from this range is forced into the clothes-drying room shown in Fig. 1.

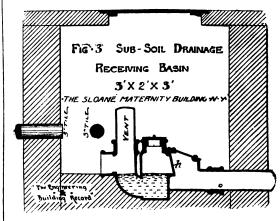

In order to facilitate the motion of the movable section of the shield, two weights are attached, connected with it by means of chains passing over pulleys as shown at L' in Fig. 5. These weights are inclosed in tubes made of galvanized iron, indicated by broken vertical lines surrounding the weight L'. The copper clothes-boiler O sets in the range and is connected with smoke-flue 1' by means of a brass pipe in which is set a valve. This pipe can be utilized for removing any surplus steam from the clothesboiler. A faucet is set in clothes-boiler for the purpose of draining off water. If this device for generating heat in the drying-room be insufficient for drying purposes that will be required in an institution of this character, coils of steam-pipes can be laid in this room and connected with the heating system, permitting steam to be utilized for drying purposes.

In Fig. 1 the heavy black lines show the position of soil-pipes, and light lines the pipes for water-supply. The soil-pipes are laid 18 inches or more below the surface of the floor, and are made of cast iron, extra heavy. Handholes are located at convenient points on the soil-pipe as shown in Fig. 1, and marked H H. also represented by a detail section in Fig. 2. These handholes are intended to facilitate the removal of obstructions from the pipe should any occur. A T-branch is set in the pipe vertically, and extended up near surface of floor, terminating with a hub. A brass sleeve is then set as shown in Fig. 2, secured by a lead joint, and in this sleeve is fitted a brass cover b, having a screw-joint. This cover can be removed easily whenever required by means of a wrench applied to the nipple shown. An ordinacy iron street-washer cover is

set in the concrete over it flush with floor, permitting access to handhole at any time.

The main soil-pipe, shown in Fig. 1, is eight inches in diameter from sewer to hall at centre of building, and there reduces to six inches, at which size it continues nearly through dining-room, thence by a 5-inch branch to recess D and extends vertically up to roof, with branches on first, second and third floors to toilet-basins and sinks.

Another branch runs to recess E, thence vertically to roof, with branches on first, second and third floors to water-closets, baths and sinks and to bath in attic. A third branch runs to recess C, where a 3-inch vent-pipe is

carried to roof. A servants' water-closet is located in basement, at D', and an engineers' water-closet, at D.'

A branch runs through laundry and dressing-room to which all waste-pipes in these rooms are connected. A line extends also from this pipe to recess, Y; thence a 3-inch vent-pipe is carried to roof. A water-closet and porcelain bath is located in dressing-room.

A branch in hall runs to the left the entire length of hall to vault, at d, terminating in a bell-trap, Another branch runs to recess in pantry, where a 3-inch vent extends to

Digitized by GOOGLE

roof. A branch runs through hall to recess F in kitchen, and thence up to second floor, to which waste-pipes from kitchen-sink and slop-sinks on first and second floors are connected. Branches extend to four leaders and also to five area-drains, which are shown in Fig. 1.

The lines of tile for subsoil drainage, shown by broken lines, extend under the area floor around the entire building, and there is also a line laid parallel with 8-inch pipe; all discharge into basin B. This receiving-basin is connected with soil pipe through a back-water trap, the arrangement being shown in detail by Fig. 3. The flapvalve h in this sketch is intended to seal the basin against any back flow from soil-pipe. This trap is ventilated. A movable plate, secured by bolts, is set over valve described, giving access to valve whenever required. A handhole is shown in the top of trap, having a cover similar to that shown in Fig. 2.

All pipes for water-supply are made of galvanized iron. The intake for water-supply is shown in Fig. 4. This intake rests on a foundation of brick 15 1/2 inches high and capped with bluestone four inches thick. The main pipe from Fifty-ninth Street to the air-chamber is two inches in diameter, the meter being set close to the wall. The lowpressure supply flows into air-chamber, thence into pipe

I-beams. This tank is made of boiler iron, the dimensions being eight feet eight inches by eight feet, and five feet four inches in height, containing 2,630 gallons.

(TO BE CONTINUED.)

NOT A CLOSED TANK, BUT CAREFUL PIP-ING IS NEEDED FOR HOT-WATER RADIATORS BELOW THE BOILER.

BANGOR, ME., December 6, 1887. SIR: Will you explain through your paper why it is that hot-water radiators or pipes below the boiler are supposed to work better under a pressure tank than when the ratus has the common open tank usually furnished?

Yours truly, . Р. Т.

[We are not aware that such is the case, nor do we think the question of open or closed tank has anything to do with the circulation in pipes below or above the boiler.

Of course, pipes or radiators below the boiler rarely or never do as well as those above the boiler. By setting them with care, and using very large sized flow and return pipes with the fewest number of elbows and no unvented air-pockets, they may work if not too much below To insure a coil's working in such a case, the boiler.

radiator below the boiler the circulative force lies in the up and down legs of the flow-pipe, or rather in the difference between the densities of the water contained in them, and therefore, if the extra weight caused by the rise in the cold return-pipe does not outweigh this difference there will be a circulation in the right direction. Its velocity will depend on carrying the flow-pipe high up and then down, on having all the pipes large in diameter, on having long and easy bends, and on having the coil or radiator not too far below the boiler. It will also be helped by having the up leg well felted and the down leg exposed as much as possible.

Pipes from the same boiler may run to the upper part of the house, with an open tank.]

FIRST REPORT OF THE BOARD OF ELEC. TRICAL CONTROL FOR THE CITY OF NEW YORK.

THE following is an abstract of this report, adopted January 6, 1888, and addressed to the Governor and Legislature of the State, to which is added an abstract of the

The total length of trench excavated for the laying of subways since July, 1887, is 189,918 feet.

The total construction of single duct for telephone and telegraph service is 903,180 feet, to which must be added 4,050 feet for distributing-service and connections to censtations.

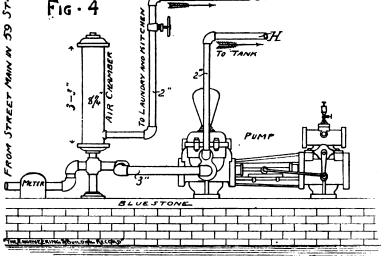

Estimating 80 wires per single duct, the total capacity for telegraph and telephone service is 72,254,400 feet, or about 13,700 miles, of wire.

The total construction of single duct conduit for arclighting and power service is 254, 250 feet, and the capacity of this conduit may be estimated as sufficient for 2,542.500 feet, or nearly 500 miles, of wire.

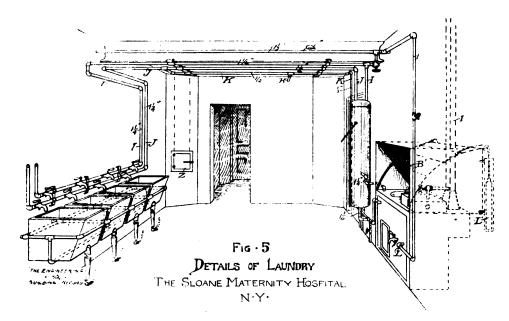

In addition to the above the number of feet of conduit for incandescent lighting is 186,745, containing 500,235 feet of conductors

feet of conductors

The capacity of conduit provided in the city of New York during the existence of the Board of Electrical Control is therefore considerably greater than there is in an city in the world, so far as the information of the Board extends; and notwithstanding the great difficulties which surround this whole subject in this city, which has a greater mileage of wire than any other, and where the cir-

·DETAILS OF INTAKE FOR WATER SUPPLY · SLOANE MATERNITY HOSPITAL · N.Y.

G to laundry and through dressing-room to kitchen, and through storeroom, terminating in a hall at the rear of the servants' dining-room. The course of this pipe can be traced in Fig. 1. Branches from G connect with boilers in laundry and kitchen.

The tank or high-pressure supply is carried from airchamber through a 3-inch pipe to a Davidson pump, which forces supply to tank through pipe H. The direction of the pipe H, which is two inches in diameter, is shown in Fig. 1. This pipe passes from engine-room through heating-chamber and servants' dining-room to recess C, thence up to tank. The tell-tale pipe X runs parallel with H from tank to engine-room, discharging into sink f.

The tank is located in the attic or fourth floor, and is elevated about 21/2 feet above the floor, supported on

however, it must be of large diameter its whole length, and the flow and the return pipes must be no smaller than the

When a coil is set as low or a little lower than the boilersay on the floor-you will not get it to work unless you run its flow or supply connection to the ceiling, or as much higher as possible, and there make an air-pocket, with aircock at the highest point; then run from this air-pocket, which some may mistake for a closed tank, to the coil, with such grades that any air that cannot get through to the boiler can return to the air-pocket above. If you use a radiator in such a place drill out its ends to 11/2 or 2 inches, according to its size, and use correspondingly large flow and return, and it will work if not too low down. It must be remembered that with a coil or

cumstances of underground construction are as difficult as in any other, the conversion of the present overhead to an underground system is a fact about to be accomplished to a very great extent at least, in the near future.

Already the Western Union Telegraph Company is

occupying the conduits which have been constructed, with some five hundred miles of wire. The Metropolitan Telephone and Telegraph Co. has some one thousand miles of wire in the subways; and the Edison Illuminating Com pany, whose conductors were laid in the trench at the time of construction, has, as has already been said. more than one hundred miles underground.

The poles and wires removed from the surface of the streets as a result of the work of the Board is as follows:

217 poles and about 500 miles of wire.

The overhead telegraph and telephone services are, except in the case of fires, of very little danger; and, in

the main, wires devoted to this service are in good con-

dition.

The overhead electric-light conductors, however, are very dangerous both to life and property whenever improperly insulated; and improper insulation of these dangerous and deadly wires is to be found almost everywhere throughout the city.

The chief provisions of the Board of Underwriters are to the effect that the electric-light wires must be of the kind known as "underwriter's wire," and that they must not in any case be carried over buildings.

"Underwriter's wire" is a wire covered with a tape saturated with white lead, and a certain length of usage renders it susceptible to moisture. After being in use still longer the tape rots away and leaves the naked wire exposed.

in many places in the city of New York electric light and power wires are carried dangerously near buildings, awnings, telegraph and other poles, lamp-posts and other street obstructions.

Again, in many parts of this city several distinct lines of poles carrying electric-light conductors are to be found on the same side of the same street, and as these poles necessarily differ in height the wires upon them form a complete network, rendering the efficient use of the hooks and ladders and life-saving apparatus of the Fire Department almost impossible.

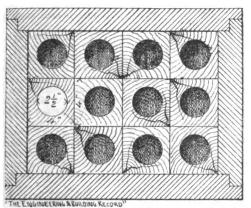

FIG.2 CROSS SECTION

ELEVATION

FIG. 3 DETAILS OF SINGLE DUCT

Again, a nuisance has been created by the fact that companies having contracts to light the city by electric-light are allowed to own the lamp-posts they use, which necessitates frequent tearing up of the pavements when any new contracts are awarded.

In inaugurating the underground system the Commis-sion has followed certain principles, which may be defined as follows:

First.—A conduit or subway for electrical conductors is nothing more than a mechanical protection for the wires within it, and a convenience for placing and protecting them underground.

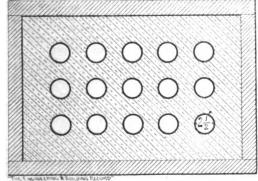

Fig. 4

Second.—Electric light and power conductors should, as a matter of precaution, if not of necessity, be operated separately, and as far as possible from those for the transmission of currents of lesser intensity.

Third.—The material and form of the subway should depend largely upon the requirements of the locality and the service for which it is designed.

Fourth.—Drawing-in-and-out conduits with convenient manholes are, in the main, the most desirable for the streets of this city, where a condition of the law allowing the companies ninety days to place their conductors in the subways after they are constructed, necessitates that the subways shall be easily accessible without serious disturbance of the pavement.

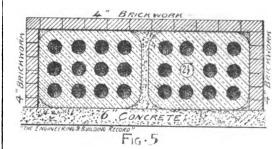

Fifth.—The success of the underground service de pends largely upon the proper insulation of the wires, and the largest liberty compatible with the preservation of the rights of others should be allowed to the companies making the state of the state ing use of the subways.

Sixth.—The nature of local connections depends to a great extent upon the service and locality for which they are designed, and here again liberty of choice under proper restrictions may reasonably be allowed.

Proceeding from these general principles, the board has constructed subways in different localities largely differing in design, size, and material

constructed subways in different localities largely differing in design, size, and material.

The subways, however, with the exception of the construction for the Edison incandescent plant, are all on the drawing-in-and-out pattern, which means a tube or series of tubes or ducts through which cables or insulated wires can be drawn, terminating at distances of about 200 feet in boxes or manoles, to which access can be had from the street by removing an iron cover.

The liberality which the Commission has seen fit to exercise in the matter of additions to the conduits for the purpose of making local connections, allowing the construction company to furnish whatever the several com-panies desire for themselves from the manhole to the points desired to be reached, has been taken advantage of

and promises beneficial results.

For example: the construction company has, at least in one instance, employed the hand-hole system of distribu-tion for the use of the telephone wires in down-town streets where it seemed desirable, while at other points a single entrance into a block in connection with house-top distribution has proved efficient.

A system of inspection of the subways and the wires within them, and their maintenance free from moisture and gases, is another duty to which the board is giving its attention.

APPENDIX.

Regulations in regard to overhead wires.

I. No two lines of poles shall be on the same side of any street or avenue.

II. No two lines of poles bearing conductors or similar electrical service shall be on any street or avenue.

III. Electric light poles shall be of iron, at least twentyfive feet in height with a diameter of not more than eight inches at the base, and having cross-arms of wood, with glass, porcelain or rubber insulators, and painted a

. IV. Poles for telegraph, telephone and other similar wires shall be at least sixty feet in height.

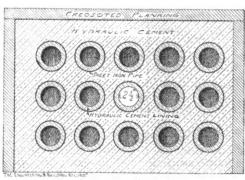

Fig. 6

V. Poles shall be placed upon the sidewalk as near the curb as possible, and no pole shall be placed within ten feet of any lamp-post or other pole.

VI. All existing regulations of the local authorities in regard to the placing of poles and stringing of wires are to continue in force.

VII. All wires shall be fastened upon poles or other fixtures with glass, porcelain or rubber insulators.
VIII. No wires shall be stretched within one foot of any

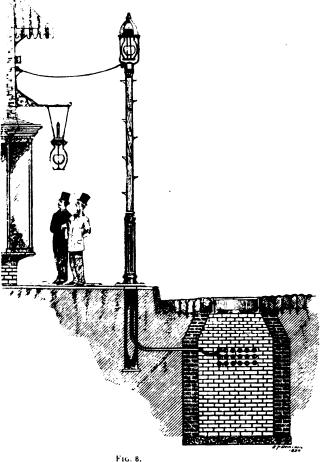

pole without being attached to the same with glass, porce lain or rubber insulation.

IX. No wires shall be stretched within twenty feet of the ground or within four feet of any building except when attached thereto with glass, rubber or porcelain insulators.

X. No arc electric light or power wires shall be stretched over any part of any house or other building.

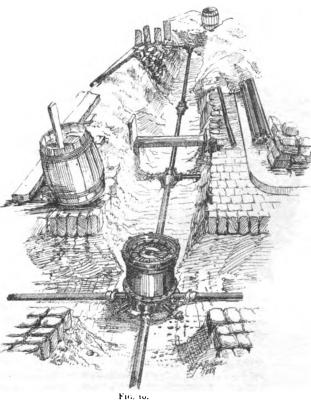

The following are some of the additions that have been suggested by Park Benjamin, Ph. D., to the rules and regulations governing the occupancy of the subways:

All conductors drawn into and operated in the conduit, and intended to convey currents of an electro-motive force exceeding fifty (50) volts, shall have an initial insulation resistance of not less than fifteen meg-ohms, per mile, per one hundred volts electro-motive force of current in the circuit. Whenever the insulation resistance of a conductor as aforesaid shall prove to be less than five (5) meg-ohms, per mile, per one hundred volts, the use of that conductor shall at once cease, unless the actual electro-motive force in its circuit be reduced so as to reestablish the foregoing ratio. establish the foregoing ratio.

The insulation resistance per mile length of all branches and feeders of the main conductors shall at least equal that of the respective conductors to which said branches and feeders are connected.

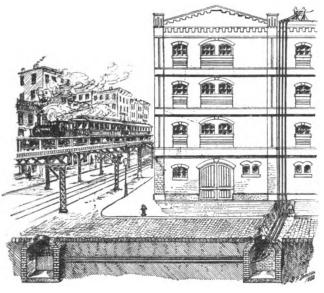

The insulation resistance of each length of cable or conductor shall be determined before said length is laid in the subway. In making this determination an electro-

motive force of current of not less than one hundred and fifty volts shall be employed, and the minimum initial resistance as provided in Rule 4 shall not be diminished through and after an immersion of the conductor under test of at least sixty consecutive hours. All lines shall be tested for insulation resistance immediately after comple-

tion in the subway, and daily thereafter for a period of one month, and thereafter at least weekly. A conductor shall be tested for insulation immediately after any new connection with, addition, or repair to, or alteration of any sort, in said conductor is made, and also whenever any other conductor is placed in the same tube; conductors conveying currents of less than fifty (50) volts electromotive force are excepted from this rule.

The work of the Board of Electrical Control has been done under the direction of its Chief Engineer, Mr. Henry S. Kearny, by a construction company known as the Consolidated Telegraph and Electrical Subway Company, of which Leonard F. Beckwith is Chief Engineer and Mr. Joseph P. Davis is Consulting Engineer. The completed conduits are the property of the construction company and he right to their use is leased by it to the various telegraph, telephone, and electric-light companies.

DESCRIPTION OF ILLUSTRATIONS.

It will be understood that for convenience of construction, and, still more, for convenience of cleaning the conduits and drawing the cables through them, they must be practically straight between manholes, shown in Figs. 1, 7, and 8, which, therefore, are required at all angles and offsets either of grade or alignment and at all branches. This necessitates a great many of them, for while a cable

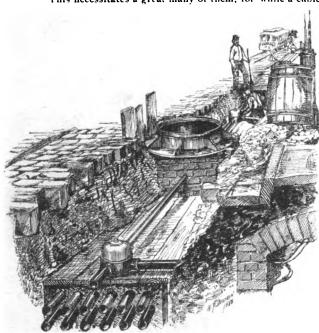

Fig. 9

can be readily drawn through 600 feet of straight conduit, manholes at street crossings have sometimes to be within 30 feet of each other.

This sufficiently explains Fig. 1. The cable that the man is pulling down from above is being hauled into the conduit. Figure 7 shows branch from main subway for house-top distribution through a block. Figure 8 shows branch from subway for electric lighting. Figure 9 shows subway in course of construction, with manhole opening and exposed ends of conduits. The single conduit on top is for distribution between manholes. Some wires are shown entering the vault on the right from the service-box in the foreground. Figure 10 shows the conduits of the Edison Electric Light Company, with junction-box in the foreground and service and joint boxes beyond.

Figures 2, 4, 5, and 6 are typical conduit sections. Figure 2 is made with creosoted wooden tubes in creosoted wooden casing, and Fig. 3 is a detail of the connection between two tubes. Figure 4 shows wrought-iron pipes laid in asphaltic concrete, with creosoted wooden box. It may also show wrought-iron or sheet-zinc tubes bedded in hydraulic cement concrete and cased with creosoted plank, but when hydraulic cement concrete is used the bottom layer of plank is omitted.

Figure 5 is a conduit made with Dorsett coal tar composition blocks bedded on concrete and covered with brick. The conduit in Fig. 6 is made of cement-lined sheet-iron pipe laid in hydraulic cement concrete and cased with creosoted plank. Between eighty and ninety per cent. of all the conduits have been laid with screwed wrought-iron pipe, laid in hydraulic cement concrete, and about twenty per cent. of the conduits are three inches internal diameter. Most of the balance are 21/2-inch as

We are indebted to Mr. William J. Sefton, Secretary of the Construction Company, for the electrotypes for Figs. 7, 8, 9, and 10, and, also, to Messrs. Kearney, Beckwith, and Davis for much valuable and interesting information.

WHAT CITIES IN THE UNITED STATES USE GARBAGE-CREMATING FURNACES?

PATERSON, N. J., January 7, 1888.

SIR. Can you give me a list of cities in the United having garbage-burning furnaces?
WILLIAM K. NEWTON, Health Officer.

Referred to our readers for definite information.

We occasionally see newspaper items to the effect that a certain city has decided to cremate its garbage, but we do not recall any official statements regarding the actual existence of any such cremators in any large city in the United States-Montreal, Can., being the last city thus referred to. The garbage and refuse at the military post at Governor's Island, N.Y., is, however, all disposed of in this way. An illustrated description of the cremating plant will be found in Vol. XII., of this journal, page 211.]

CAN THE ELEVATED ROADS BE OPERATED WITH LESS NOISE?

THE following communication from a gentleman of very large experience in L-road construction is partly in reference to the complaint of our correspondent "Knickerbocker" under the above heading in our issue of December 31, and partly in answer to a private note addressed him on the same subject, which will account for the reference to Trautwine, who says, page 391 of the old edition of "Trautwine's Pocket-Book": "It is a remarkable fact, not satisfactorily accounted for, that when lengths of from 100 yards to some miles of rails have been perfectly welded or riveted together tightly, and spiked to the ties as usual, no elongation or contraction by heat or cold could be detected." Obviously, if this could be safely done all the noise due to the hammering of wheels on rail-joints would be eliminated, and this, especially on an elevated road, constitutes more than three-fourths of the noise due to a moving train. An oblique joint has been tried on some portions of the Elevated Road, but with only partial success.—ED.]

HARRISBURG, December 26, 1887.

SIR: The "puffing" of the engines being due -i. ϵ ., its excessive amount—to slack joints, etc., is remediable by attention to the leaks, slacks, lost motion, etc., causing or necessitating it. But some puff, of course, must needs be.

The rolling sounds also must remain whatever the motive power. In view of the accidents which have befallen in consequence of expansion of "butting rails," I think Mr. Trautwine's line long rail were a perilous venture. The only effectual remedy for your complainant seems to be with peighborhood.

PROPOSED BRIDGE OVER THE HUDSON RIVER AT NEW YORK CITY.

SINCE the previous article under this heading was in type, we have received at the last moment the following from Mr. Gustav Lindenthal:

The proposed North River Bridge is for six railroad tracks on a floor platform eighty-six feet wide (same as East River Bridge); clear height at middle of river, 145 feet above high tide at 50° Fah. temperature (the floor would sink four feet in summer and rise the same about in winter). Length of middle span, 2,850 feet, to centres of towers, each pier within the legal pier-line to centres of towers, each pier within the legal pier-line of each shore. The end spans are about 1,500 feet long each, and the total length between anchorages is 6,500 feet, including anchorages. The height of metal towers to lower cable is 400 feet; to top, 500 feet, which stand on masonry piers 340x180 feet respectively and are nearly 75 and 180 feet deep.

The anchorages are each about 320 feet long and 180 feet wide and are 210 feet above the pavement. The six

feet wide and are 210 feet above the pavement. The six railroad tracks pass through a tunnel in each anchorage

The type of the bridge is that of two suspended huge arch-ribs (or braced arches) supported on steel or wrought towers of great stability, from which they descend back to the large anchorages, which resist the pull from the large arch-cables. The latter are 50 feet apart, strongly braced together, to resist the deforming effects of passing Each cable has an outside diameter of four feet and will have the smooth cylindrical appearence of a huge bent metal shaft.

The cables are inclined towards each other, or "cradled," one foot in ten. From them are suspended the platform and the trusses, between which the six tracks are placed. Four wind-cables of 12½ inches diameter are in two horizontal planes, securing the lateral stability of the superstructure.

The towers are strongly braced inside with heavy mem-

bers, and on outside with large-sized lattice-filling between the curved columns. On top the arches are held apart by a heavy cross-bracing. The towers are connected at the top and bottom into one coherent structure. The towers are connected solid

The architectural features of the bridge were considered of the highest importance and were sought to be obtained in a natural manner without attempts at ornamentation.

The bridge is to be proportioned for six heavy trains, 1,500 feet long each, drawn by two of the heaviest known engines. It is not likely that six such trains would meet on the bridge in a lifetime. Ordinarily the loads will only be a small fraction of the assumed maximum.

The bridge will be proportioned against a wind pressure of fifty pounds per square foot on all exposed surfaces. The principal provision for it are are two wind-trusses (forming the top and bottom of suspended track platform) combined with four wind-cables, each 12½ inches diameter and kept under constant tension by a lever arrangement in towers.

Each cable is surrounded with a steel mantle one-eighth of an inch thick, leaving an air-space between it and the wire cable inside. All connections with web members will be adjustable during and after erection, so that both cables shall be equally strained from the uniform loads of the superstructure at a middle temperature.

Cost of bridge alone, about \$15,000,000. Time of building, three and a half years.

A bridge with a middle pier would be more expensive

on account of depth of foundation and the impracticability of using wire cables for more than one middle span. The

great strength of wire as compared with metal in link-cables makes the longer span bridge cheaper.

The rigidity of the bridge will be such that all trains will be able to cross it at fast speeds (same as on solid ground) without causing any discernible oscillation.

CONNECTICUT CIVIL ENGINEERS' ASSO-CIATION.

AT the annual meeting the following officers were elected: President, C. H. Bunce, of Hartford; First Vice-President, F. F. Weld, of Waterbury; Second Vice-President, William B. Palmer, of Bridgeport; Secretary and Treasurer, D. S. Brinsmade, of Birmingham: Assistant Secretary, E. P. Augur, of Middletown. Executive Committee: C. H. Bunce, of Hartford; B. H. Hull, of Bridgeport; E. P. Augur, of Middletown; C. M. Jarvis, of Berlin; C. E. Chandler, of Norwich.

The president's address was read by Mr. C. E. Chandler, of Norwich

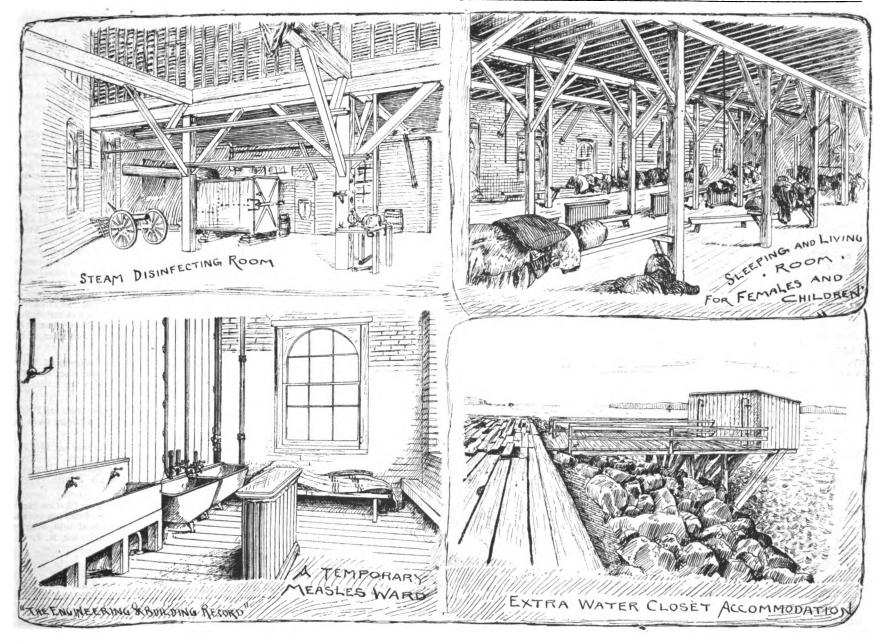

of Norwich.

A paper was read by E. P. Augur, City Engineer, of Middletown, describing the adjustable effluent pipe of the Middletown reservoir, which was illustrated by blue prints. The discussion of the rental value of hydrant service was continued.

F. B. Durfey, of Norwich, read a paper describing the new water-works at Bath, Me., built by him as contractor, after designs by J. Herbert Shedd, C. E. The filtering gallery was a novelty to most of the members present. It consists of about 125 feet of 15-inch Akron pipe, 400 feet of 12 inch, 50 feet of 8-inch, and 800 feet of 4-inch pipe.

14

Drawn from Photographs.

laid about four feet under the bed of a fresh-water pond from which the water filters through a gravel filling and runs through the above pipes to a pump-well, from which it is pumped to a tank, the top of which is 250 feet above

tide water.

Papers were also read by F. W. Whitlock, Assistant City Engineer of Waterbury, on "Co-ordinate Surveying and Plotting," and T. H. McKenzie, Engineer of the Southington Water-Works, on "Mason-Work." The latter paper elicited a long and interesting discussion on the classification of stone masonry.

ILLINOIS SOCIETY OF ENGINEERS AND SURVEYORS.

SURVEYORS.

THE third annual meeting of the Illinois Society of Engineers and Surveyors will be held in the State House at Springfield, commencing Wednesday evening. January 25, and continuing January 26 and 27.

The following papers will be presented: "President's Address," Prof. I. O. Baker; "Bridges and Viaducts for Cities," D. W. Mead, City Engineer, Rockford; "Laying out Towns, and Monuments for Cities, etc.," Prof. T. C. McClanahan, Monmouth; "Highway Bridges," J. O. Wright, Gilman; "Mine Surveying," F. V. Alkire, Petersburg; "Surveying, Practical and Artistic," D. L. Braucher, Civil Engineer, Lincoln; "Culvert at Nichols' Hollow," E. A. Hill, Acting Chief Engineer I., D. & S. R. R., Indianapolis, Ind.; "Specifications for Bridge Iron," Prof. I. O. Baker, University of Illinois; "Mining Engineering Topic," A. C. Braucher, Mining Engineer, Raton, New Mexico; "Bridge over the Ohio River at Cairo," S. F. Balcom, Assistant Engineer, I. C. R. R., Champaign: "Village Plats," Z. A. Enos, Springfield; "Artesian Wells," Prof. T. B. Comstock, University of Illinois; "Importance of Replacing Wooden Trestles with Iron and Stone Structures," J. M. Healy, Division Engineer, I. C. R. R., Champaign; "Highway Bridges," P. E. Lane, Bridge Builder, Chicago; "Economic Efficiency of Tile Drains and Open Ditches." D. J. Stanford, County Surveyor, Chatsworth.

Steps are being taken to secure railroad rates of 1½ fare. Notice of the final arrangements will be sent to

Steps are being taken to secure railroad rates of 11/3 re. Notice of the final arrangements will be sent to tembers. Those desiring to join the society should write

to the secretary for certificates to be signed by the ticket agent at the starting point.

The hotels will give reduced rates. The Revere House

will be made headquarters, and programmes for the meeting can be obtained there.

The Executive Secretary is A. N. Talbot of Champaign,

ST. PAUL CIVIL ENGINEERS.

ST. PAUL CIVIL ENGINEERS.

ST. PAUL, January 10.—Last night the annual meeting of the St. Paul Civil Engineers' Society was held at the Hotel Ryan. A paper was read by M. A. Munster upon the formula for calculation of plate-girders. A. Johnson, United States Assistant Engineer, read a paper on the preservation of the Falls of St. Anthony, at Minneapolis, citing the work of 1883 done under the direction of Major C. J. Allen. The following officers were elected for the ensuing year: President, C. F. Lowett; Vice-President J. H. Morrison; Treasurer, J. C. L. Annan; Secretary, George L. Wilson; Librarian, A. Munster. L. Wilson; Librarian, A. Munster.

BUILDERS' NATIONAL CONVENTION.

THE annual convention of the Builders' Exchanges of the various builders of the United States is to meet this year at Cincinnati, February 7. The meetings will be held at College Hall and the headquarters at the Gibson House. Exchanges have been organized at Charleston, S. C., New Orleans, and Baltimore. The report on uniform form of contracts is expected to be an important featform form of contracts is expected to be an important feature of the discussions.

"THE IRON AGE."

WE congratulate the *Iron Age* on its change of form and new make-up. We can hardly doubt that every one of its readers and advertisers will appreciate how great the improvement its present form is to the old one, which always seemed to us unwieldy and inconvenient. Our contemporary has our best wishes for its continued prosperity. perity.

SAVANNAH SEWERAGE PLANS.

WE were in error in the reference in our editorial last week to the proposed plan for a system of sewers for Savannah in stating that several plans were made. Colonel Waring was the only engineer employed to submit a plan,

INTERIOR DECORATIONS

INTERIOR DECORATIONS.

WE have received a work under the above title, by Arnold W. Brunner and Thomas Tryon, architects, of this city. A portion of the matter originally appeared in Building. The hall, staircase, library, parlor, dining-room, study, and bedrooms are treated; besides fifty vignettes, there are fifteen tull page plates. The authors state that their "aim is simply to touch upon the points that arise in connection with the subject, and to present suggestions rather than definite instructions on decorative questions." It is published by William T. Comstock, 23 Warren Street, New York, at \$3.

PERSONAL.

GEORGE E. EVANS has succeeded George Bowers as City Engineer of Lowell, Mass.

C. HOWARD WALKER and Herbert R. Best, architects, of Boston, became associated as partners January 1.

J. McNulty, E. M., has returned to New York after a prolonged absence in the Southern mineral regions, in whose development he is engaged.

M. J. BECKER, Chief Engineer Pennsylvania Company's South-Western System, has removed his office from Columbus, O, to Pittsburg, Pa.

SAMUEL R. FILLEY, a successful merchant, and the promoter of the Suburban Rapid Transit Railroad of New York, and its first president, died suddenly on January 8.

MR. FRANK WALLER and Mr. William F. Widmayer have combined their offices for the purpose of practicing as architects and engineers at 31 and 33 Broad Street, New York City.

FREDERICK MERCER, Superintendent of Lehigh Valley Coal Co., died at Wilkesbarre, Pa., on January 11. Mr. Mercer at one time was Chief of the Engineering and Construction Department of the Lehigh Valley Railroad, and as such built its lines from Penn Haven to Wilkesbarre.

COLONEL A. P. BLUNT, U. S. A., lately in charge of the Military Depot at Fort Leavenworth, Kansas, has been assigned to duty as Depot Quartermaster, Fort Leavenworth, Kansas. Captain J. W. Pope, U. S. A., has been appointed to the position made vacant by Colonel Blunt's removal Colonel Blunt's removal.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

TRADE CATALOGUES.

MESSRS. MAHAN, PORTER & Co., manufacturers of sewer-pipe, fire-brick, stove-pipe, chimney-tops, flue-linings, lawn-vases, etc., at New Cumberland, Hancock County. W.Va., have just issued an illustrated descriptive cata logue price-list of their wares.

SAMUEL H. FRENCH & Co., paint manufac, turers, and importers and dealers in painters and builders' supplies, of York Avenue, Fourth and Callowhill Streets, Philadelphia, Pa., have just issued their catalogue and price list for 1888, with an index. The catalogue fills more than 200 pages and fully illustrates and describes a variety of architectural plaster work, slate mantels, grates, and open fire-places, plain and ornamental glass, etc., etc.

THE Chalmers-Spence Co., of 419-425 East Eighth Street, New York, have just issued a revised illustrated catalogue of their asbestos material, fire-felt, etc.

THE Brown Hoisting and Conveying Machine Company, of Cleveland, O., send us their illustrated and descriptive pamphlet.

THE catalogue of the Newton Machine Tool Works, of 24 Wood Street, Charles C. Newton, engineer and proprietor, is among the mercantile catalogues just receiced.

THE Standard Car-Heating and Ventilating Co., of Pittsburg have sent us their pamphlet explaining and describing the Westinghouse heater.

For works for which proposals are requested see also the "Proposal Column," pages i-v-vii-viii-112-ix.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE ENGINEERING & BUILDING RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and rel able news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

WATER. SEWERAGE, ETC.

NEW YORK.—The Croton Aqueduct Commission will shortly advertise for proposals for about twenty-five thousand tons(2,000 pounds) of 48-inch cast-iron water-pipe 12-foot lengths, and one thousand tons of special castings; also, for laying same from One Hundred and Thirty-fifth Street to Central Park Reservoir in eight lines; construction of gate-house, also.

PHILADELPHIA, PA.—A movement, looking to the appointment of a commission of experts to examine into the feasibility of improving the sewerage system of the city of Philadelphia, has been inaugurated by the introduction of an ordinance into city councils and its reference to a committee which met some day since to consider the subject. No action was taken at the meeting, but an adjournment was had in order to allow the committee to secure more information and procure a report on the subject, prepared some years since by Rudolph Hering.

MILWAUKEE, WIS.—It is probable that several thousand dollars will be expended on sewer work here this year. The Board of Public Works is already considering numerous improvements in the south side of the city.

ROCKFORD, ILL.—Daniel W. Mead, City Engineer, writes us as follows concerning the projected sewerage system: "I am now finishing the plans for a system of sewers for th s city. The work will be completed by spring. The city has good natural drainage, and but little storm-water will therefore be taken into the sewers. The sewers will be mo tly pipe-sewers."

SIDNEY, O.—Our correspondent writes:

'The vote on appropriating \$10,000 for the improvement of our water-works carried by 210 majority. J. N. Anderson, Secretary of Water-Works Board, can furnish particulars of what will be done and when work will be let.'

SANFORD, FLA.—Our correspondent writes: "We are making the following improvements to our water-works: New pump and boiler increased in size, boiler from 20 horse-power to 65 horse power, pump from 4-inch to 10-inch, Worthington; old pump, etc., will also be held as reserve; large brick reservoir, 50 feet in diameter, 16 feet deep; new mains increased in size from 3, 4, and 6 to 4, 6, and 10 inch.

DENVER, Col.—City Engineer H. C. Lowrie writes: "After seven years' experience in our system of separate sewers we are about to double our quantity, and the plans and specifications for this work, the same in general features as those of the old, were adopted, not only without criticism, but without investigation or a single inquiry by any one."

BROCKTON, MASS.—Concerning a published report that water-works were to be built here our correspondent writes as follows: "We established a system of water-works several years since and they are in successful operation."

Boston, Mass.—The Council order that the Mayor be requested to petition the Legislature for the passage of an act to authorize the city of Boston to construct subways for sewers, water-mains, etc., and to lease the privilege of using the same to the various telegraph, telephone, gas, and electric-lighting companies, has been referred to a special committee, consisting of Aldermen Gove, Wilson, and Short.

Brantford, Canada.—The water-works question is again being agitated here and conclusive developments may soon be expected. The City Council will probably dispose of the matter, which has been in an unsettled state for over a year, at its next session.

MILWAUKEE, WIS.—The shaft on Dane Place, through which the earth to be taken from the big flushing tunnel bore will be removed, has reached the required depth, and the work of putting in the solid brick bottom has been completed. As soon as possible the necessary hoisting machinery will be placed in position and the work of drifting will be begun. A coffer-dam to keep back the waters of the lake has been built, and the pumps put in operation. The shaft or well at the foot of the bluff has been sunk about ten feet.

MARINE CITY, MICH., will vote on February 6 on the proposition to issue \$8,000 bonds for extending their water-works system.

MODESTO, CAL.—The sum of \$800,000 in bonds will be issued for a canal for the Modesto irrigation district.

PHŒNIX, ARIZ.—The McPherson Canal Co. has been incorporated with a capital stock of \$2,000,000. The canal will be 40 miles long and will irrigate 100,000 acres. Considerable of the work remains unlet.

Los Angeles, Cal.—The Hosperia Water Company of this city has been incorporated; capital stock, \$2,000,000. ('. A. Barnes, and others, incorporators.

- STRONG CITY, KAN.—A water-works company has been organized here. Address W. P. Martin.

MACON, GA.—Our correspondent writes from here, stating that the election which was to have been held on the 7th inst., did not take place, as the call for such an an election was repealed by the Common Council, owing to an apparent legal objection. No further steps have been taken.

Jamaica, N. Y.—The Town Board of this place has received from the newly completed Woodhaven Water Works Company an application for permission to supply the town with water. The capital stock is represented to be \$50,000, and the incorporators are Florian Grosjean, John C. Mulligan, and others. The Town Board and the Commissioners of Highways will meet in joint session on the 20th inst. to determine the matter.

Hugo, Kan.—It is reported that the waterworks system here is to be extended.

CAMBRIDGE, MD.—In reference to waterworks matters here our correspondent writes as follows: "The Board of Trade is in correspondence with parties and expect proposals. Communications on the subject may be addressed to A. H. Bayley, Mayor, or to the Board of Trade, Cambridge. No definite plan adopted as yet."

KANE, PA. — Concerning a report that water-works were to be constructed here, our correspondent writes: "The water-works here were completed this fall under the name of the Spring Water Co., of Kane."

WATKINS, N.Y.—Our correspondent writes as follows about water works matters: "Our citizens have commenced agitating the subject of water-works, etc., and a meeting to discuss the question will soon take place. After it has been held and some definite action taken, I will keep you advised from time to time."

Monson, Mass.—Our correspondent writes from here as follows: "A petition is now pending before the Legislature for a charter for the incorporation of a water company."

LEBANON, PA. — A. Harvey Tyson, of Reading, who has been employed to investigate the sources of water-supply, has made his report to Councils, recommending the tapping of the Swatara Creek at Jonestown, and the building of a pumping-station and standpipe and attachments, at a cost of \$200,000. The special Committee on Water recommended the adoption of this plan and submitted a proposition from Messrs. Arthur and Horace Brock, who offered to build the entire works and lease them to the city at a rental of five per cent. on the cost. It is expected that conclusive steps will shortly follow.

EL PASO, TEX.—A movement is on foot in Western Texas and Southern New Mexico to secure Federal aid, if possible, in building an irrigating canal, from 200 to 230 miles long, for the purpose of reclaiming vast tracts of land that are now arid wastes. It is proposed to start the canal at a point on the Rio Grande above the Jarnado Del Murte, in New Mexico, and carry it along the high lands of the Rio Grande Valley as far below El Paso as it is found practicable.

NEEDHAM, MASS.— Our correspondent writes from here as follows: "At a town meeting, held December 29, 1887, it was voted that a committee of five be appointed or elected for the purpose of peritioning the next Legislature for a charter to enable the town of Needham to put in such a system of waterworks as the town may hereafter vote for."

Weffing Water, Neb.—Our correspondent writes: "An election held January 3 to vote on the proposition for issuing \$15,000 bonds for the construction of a system of water-works in Weeping Water resulted in favor of establishing the works. The bonds have not yet been issued, nor has the contract been let."

NIAGARA FALLS, N. Y.—Concerning a published report that this place was to erect water-works, our correspondent writes: "The village of Niagara Falls have had the Holly system of water-works in for the past eight years."

PORTSMOUTA, VA.—It is reported that the Portsmouth and Suffolk Water Co. is negotiating for a site on which to erect a reservoir.

NESS CITY, KAN.—A report is circulated that \$25,000 will be expended in establishing water-works here.

MALDEN, MASS.—It is probable that the water-works system here will be improved soon.

HIGHLAND, COL.—Several thousand dollars' worth of water-works improvements will be commenced here at once.

SONOMA, CAL.—A water-works company has been established here. George H. Maxwell can give information.

JEFFERSON CITY, Mo.—F. B. Perkins, of Springfield, Mo., has been granted a franchise to erect, maintain, and operate a system of water-works in this city. Work is to begin at once.

CANON CITY, Col.—It is reported that a separate water-supply is to be established for the prison buildings.

LONDON, CANADA. — Our correspondent writes: "A by-law to authorize the issue of debentures to the extent of \$750,000 for the increase of the water-supply and other purposes in connection with the water-works was submitted to the people and defeated January 2, 1888. The supply at present is about 2,000,000 gallons daily and the proposed increase was about 1,500,000 gallons per day, all of which is spring water of the finest quality. The result of the vote is that the extension will lay over for another year."

BRIDGES.

BROCKPORT, N. Y.—In answer to an inquiry about a projected bridge here we are informed by our correspondent as follows: "Bridge being built by the State. Contract let by the Superintendent of Public Works. He will give full information. The village has nothing to do with it."

DAYTON, O.—The Commissioners of Mongomery County are considering the question of erecting a \$20,000 bridge over the Mad River, near its mouth.

LAREDO, TEX.—The Intermediate Bridge and Tramway Co. will build a bridge over the Rio Grande at this place.

HARRISBURG, PA.—The sum of \$55,000 will be expended in bridges here. Address Charles E. Pugh, General Manager, Pennsylvania R. R. Co., 233 South Fourth Street, Philadelphia, Pa.

MILLBURY, MASS.—Address Charles Howard, Superintendent of the Providence and Worcester R. R., for details of bridge to be erected here. Office at Providence, R. I.

ONEONTA, N. Y.—Concerning a report that a bridge was to be erected over the Susquehanna at this place, our correspondent writes: "There has not been as yet any steps taken for the construction of a bridge over the Susquehanna River, nor is the question yet agitated officially."

JACKSON, N. H.—A large bridge will probably be erected here.

WESTFIELD, MASS.—The town of Chicoper will erect an 80-foot bridge.

NAVESINK, N. J.—A new bridge will probably be placed over the Shrewsbury River at this place.

LONG LAKE, N. Y.—It is reported that a bridge is to be erected over the lake.

FORT PLAIN, N. Y.—Address the County Commissioners for details of projected bridge for this place.

AYLOMER, CAN.—Several new bridges will be erected here.

GAS AND ELECTRIC-LIGHTING.

NEW BRUNSWICK, N. J.—The Common Council has declined to grant a franchise to the gas company to erect poles and electric light plant in the streets of this city. Some two years ago, when the electric-light company was started, and before the price of gas was reduced by the competition, the gas company secured a contract with this city for three years. This contract expires next year, and the gas company wish to secure another franchise for electric-lighting in addition.

HELENA, ARK —An electric-light plant, to cost \$25,000, is to be built here.

STRONG CITY, KAN.—An electric light and gas company has been established here. W. P. Martin is at its head.

EAGLEVILLE, ILL.—The citizens of this place have organized to drill for gas.

BAXTER SPRINGS, KAN.—Capitalists from St. Louis and Kansas City have decided to bore wells and supply this place with natural gas.

NEWCOMERSTOWN, O.—This place is to be supplied with natural gas by the South-Western Natural Gas Co., who will pipe the streets as soon as the weather permits.

FREDONIA, N. Y.—An electric-light plant is projected for this place.

Oskaloosa, Iowa.—An electric-light plant will be erected here.

TOLEDO, O.-An electric-light plant is to be established here.

PETERSBURG, VA.—A fuel power lighting company has been formed here to construct and operate water-gas works in the city of Petersburg for lighting and heating purposes, and supplying gas as fuel for manufacturing, cooking, and mechanical purposes.

SLATINGTON, PA.—The Citizens' Electric Light and Power Company has concluded arrangements by which it will light this place by the latter part of January. The Richter Electric Light Co., of Camden, N. J., will put up the plant and put in the lights. The entire cost will be about \$10,000.

REIDSVILLE, N. C.—It is reported that this place will be lighted by electricity.

STREET WORK AND PAVING.

MILWAUKEE, WIS.—Several streets in different portions of the city are to be paved with cedar and granite blocks.

RAILROADS, CANALS, ETC.

MAINSTEE, MICH.—The Chicago, St. Louis and Paducah Railroad Co. has just completed 15 miles of road, has 25 miles more under contract, partly graded, and about 14 miles more yet to be located.

HAMMONTON, N. I.-A new railroad, 18 miles long, is about to be constructed from this place to Tuckerton, Burlington County, by Joseph D. Wharton, of Camden.

MILWAUKEE, Wis.—At a recent Council meeting the Hinsey South and East side cable ordinances were read a third time and ordered engrossed without debate.

BIDS OPENED.

MILWAUKEE, WIS.—Synopsis of bids for furnishing 100 double-nozzled fire-hydrants opened January 6 by the Board of Public Works:

Galvin Brass and Iron-Works, Chicago, Ill. single-valve, Matthews' pattern, \$38. R. D. Wood & Co., Philade!phia, Pa., iron valve and waste, \$38; brass valve and waste,

\$39.50.
The contract was awarded to R. D. Wood

HOPEDALE, ILL.—Synopsis of bids for constructing water-works, opened January 2 by J. P. Waldon, Town Clerk: George G. McManis & Sons, Princeton, Ill., \$2,195; Challenge Wind and Feed Mill Co., Batavia, Ill. \$2,200; C. M. Hoghton, Delavan, Ill., \$2,140. The contract was awarded to the lowest midder.

MILWAUKEE, WIS.—Synopsis of bids for furnishing 1,000 tons of cast-iron water-pipe for the mains of the city, opened January 6, by the Board of Public Works:

MISCELLANEOUS.

THE Santa Barbara Lumber Co. are building a lumber wharf several acres in extent at a cost of \$150,000, so arranged as to unload from cars or ships; expect also to import coal, etc. They having one of the best harbors on the Pacific coast.

MANCHESTER, N. H.—The design of Fred W. Stickney, of Lowell, Mass., for the Elliott Hospital, to be erected here, has been accepted.

PROPOSALS. (Continued from page viii.)

JAIL.—Proposals are wanted at Georgetown, Tex., for erecting a limestone jail. Estimated cost. \$30,000 No date specified. Address the County Commissioners

JAIL.—Proposals are wanted at Leesburg, Va., until February 4, for erecting a jail. Bids for iron and steel work are to be separate. Address Edgar Littleton

BUILDING PIER.—Proposals are wanted at New York City until January 27, for removing the existing pier at the foot of West Thirty-eighth Street, and for preparing for and building a new wooden pier and approach at the foot of said street, and for repairing the existing crib-bulkhead thereat. Address the Department of Docks, Pier 1. North River.

WATER-WORKS.—Proposals are wanted at Joliet, Ill., until February 1, for the construction of a twenty-mile system of water-works. Address Mayor John D. Paige.

PROPOSALS.

FLAGGING.—Proposals are wanted at Brooklyn, N. Y., until January 18, for flagging in certain streets. Address George Ricard Conner, Commissioner of the Department of City Works.

HEATING AND VENTILATING APPARATUS.—Proposals are wanted at Cleveland, U., until January 23, for the heating and ventilating of a hospital building. Address Messrs. Lehman & Schmitt, Architects, Room 31, Benedict Block, Cleveland, O.

ELECTRIC - RAILROAD FURNISHINGS.— Proposals are wanted at Little Rock, Ark., until Jan-uary 21, for furnishing train 1ail, frogs, and switches, cuives, crossings, joint-plates, kneed, spikes, etc., for a single-track, 48½-inch gauge. Address Fired J. H. Rickon, Engineer, City Electric Railway, Little Rock,

HIGHWAY SUPPLIFS.—Proposals are wanted at Reading, Pa., until January 18, for furnishing certain supplies for road work. Address George H. Felix. Secretary, Highway Department.

TELESCOPE-HOLDERS.—Proposals are wanted at Washington, D. C., until January 2t, for fifty, more or less, telescope-holders, according to specification. Address R. W. Greely, Chief Signal Officer, War Department, Washington, D. C.

STEAM-HEATING. — Proposals are wanted at Washington, D. C., until February 12, for supplying and putting in place, complete, in the Court-House and Post-office at New Albany, Ind., a low-pressure return-circulation steam-heating and vectifating apparatus. Address Will A Freret, Supervising Architect of the Treasury Department.

A COLLECTION OF DIAGRAMS

Representing the General Plan of

TWENTY-SIX DIFFERENT WATER-WORKS,

Contributed by Members of the

New England Water-Works Association,

And Compiled by a Committee.

1887.

NEW YORK:

PUBLISHED BY THE ENGINEERING AND BUILDING RECORD, 82 & 84 FULTON STREET.

INTRODUCTION.

OFFICE OF SECRETARY.

NEW BEDFORD, MASS., November 1, 1887.

THIS collection of diagrams is the result of the persistent efforts of Messrs. William B. Sherman, of Providence, R. I., and Walter H. Richards, of New London, Conn., who, as a Committee on Exchange of Sketches, have secured these drawings from members of the Association. The following extract from a report presented by these gentlemen at the Manchester, N. H., meeting in June, 1887, will explain in part the origin of the collection:

"In answer to circular letters sent out to members, there

"In answer to circular letters sent out to members, there were received rough sketches of general plans of twenty-three were received rough sketches of general plans of twenty-three water-works represented in the Association. Having this data on hand, though crude in many particulars, it was decided to put the same into available shape for the benefit of the members. This has been accomplished by the Committee without cost to the Association. From these rough sketches—revised, reduced to uniform size of 10 by 15 inches—a set of tracings has been made, and a sample folio of blue prints prepared. This folio and set of tracings are herewith presented as forming the main part of this report."

Since the Manchester meeting three more subjects have been received and subscribtions for sets of reproductions from the tracings have been called for. The ready response to the call is evidence of the value of the Committee's work, and arrangements were made with The Engineering And Building Record for publication in this present form.

R. C. P. COGGESHALL,

Secretary,

Secretary, New Figland Water-Works Association.

WHY THE LITTLE ROCK RESERVOIR BURST.

Our readers will remember an account of this accident which appeared in our issue of November 12, 1887. It seemed pretty clear at that time that the wall fell over because it had not sufficient breadth of base, but it now appears that this was altogether a mistake.

The Arkansas Press has discovered the true cause of the accident and publishes it to the world as follows. After stating that "a number of societies composed of scientific men have discussed it, but none of their arguments were correct," the Press says:

"The cause of the accident was solely due to the geological formation of the ground, which is at variance with nearly every law of nature. The primitive whinstone, or trapp-rock, was found lying upon a loose bed of rotton sandstone, enclosing a strata of fire-clay or soapstone."

This is, indeed, a deplorable "state of facts,' a marked and melancholy instance of what has well been called "the total depravity of inanimate things." As Mr. Squeers remarked. "Natur' is things." As Mr. Squeers remarked, "Natur' is a rum un," and in this case she evidently "put up a job" on the too confiding Colonel Zeb (the contractor) by carefully covering an eligible reservoir site with what would appear to his unsophisticated eyes, and those of the Arkansas Press, to be a "primitive" formation. She then greased the under side of this trap rock (most appropriate name) with her slipperiest materials and calmly awaited developments.

Of course, any intelligent engineer would know that trap-rock, far from being "primitive," is a very late geological formation of volcanic origin and most uncertain relations, and would have made some preliminary borings to see what was below; but Nature knew her man and bided her time, and she was not disappointed. Zeb came, wall slid, she conquered.

Now, to quote again from our esteemed contemporary (the italics are ours):

"In building the middle wall there was a footing for about 100 feet dug below the lower reservoir. The footing-course in this 100 feet could not have slipped, as the greatest thickness of the wall at this point was nearly fourteen feet."

Here we have at last the "immovable body" which philosophers have so long discussed and never discovered. It is a wall "nearly fourteen feet thick." If De Lesseps would only put such a wall alongside of his Panama Canal he would have no more trouble with that mountain which is said to be sliding into it.

The Press goes on to say:

"This natural ground slipped and carried the wall with it, and to show the absurdity of all past conjectures, how totally at variance they are with the facts, it is only necessary to state that the whole wall fell as a solid block."

And concludes "flat footed" as follows:

'The best engineer in the world could not have foreseen such a possible danger."

We have no doubt that our Arkansas contemporary is sincere. He seems to have the "courage of his opinions," and any one who sees no contradiction in discovering various other strata below "primitive" rock would have little diffi-culty in believing anything. For the inhabitants of Little Rock in general, and for Colonel Zeb Ward in particular, we have only the sincerest sympathy. If the *Press* keeps on this way Colonel Ward will appreciate the saying, "Save

me from my friends," and may live to regret that the flood did not carry off either him or his journalistic defender.

As for the Little Rockians, they may as well, if the Press is right, forego all thought of any water-works of their own. Other cities may rejoice in sparkling reservoirs and aspiring stand-pipes and sit every man under his own shower-bath, but it is not for them. They must continue to work the slow, laborious pump-handle, because between Nature and the Arkansas Press "the best engineer in the world cannot foresee a possible danger" in that locality, and who in that case would be fool enough to start another reservoir or rebuild the ruined one?

In order to make ourselves clear to the citizens of Little Rock, we should state that it seems that the contractor's masonry was good, but there is no evidence that either he or the local press realized that it is of the utmost importance that a skilled engineer should be employed to design the section of the dam, and this cannot be done intelligently until he knows precisely the character of the foundation upon which it is to rest. When these precautions are taken and properly acted on, Nature is not apt to play a trick on the contractor.

SEWER-WORK AND A CITY ENGINEER.

WE notice that an ordinance is now pending before the City Council of Minneapolis making radical changes in the Sewer Department. The sewer-work has heretofore been done under the direction of the City Engineer. It is now proposed to take the entire control of the Sewer Department out of the hands of the Engineer and to place a new official, to be known as the Superintendent of Sewers, at the head, he to appoint the sewer inspectors and foremen, etc. There appears to be no fault found with the City En gineer, and it looks very much as though this was an attempt to let politics creep in.

City Engineer Rinker made a strong protest against the ordinance when it came before the committee, saying that its passage would place him in a position in which he would be held responsible by the public for work over which he

could not have the slightest control.

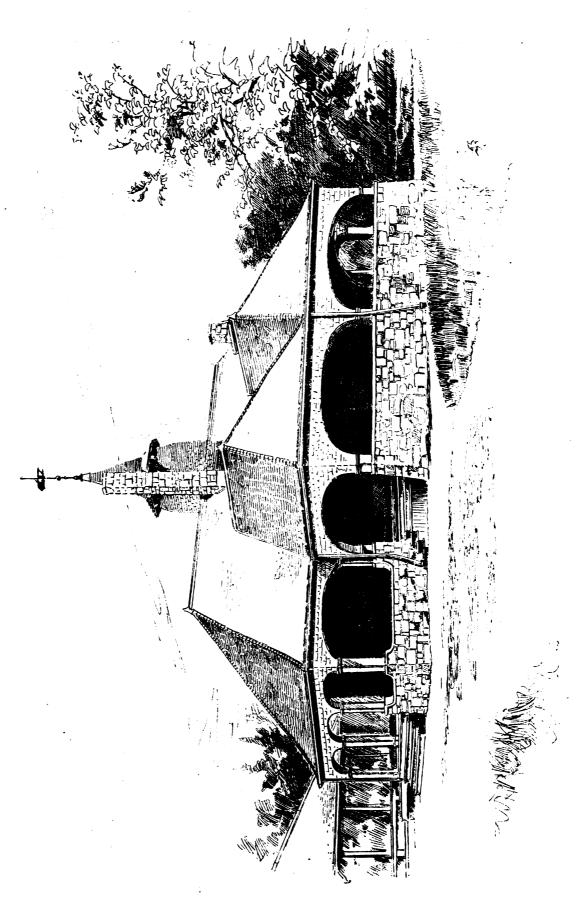

We do not know what is at the bottom of this move, but it looks very much as though the Sewer Department, constantly having new work to do, has some patronage at its disposal which some politicians want to control. In any wellregulated municipal engineering department we should consider that the City Engineer should certainly have control of the sewer-work.

RIVER AND HARBOR WORK OFTEN MISREPRESENTED.

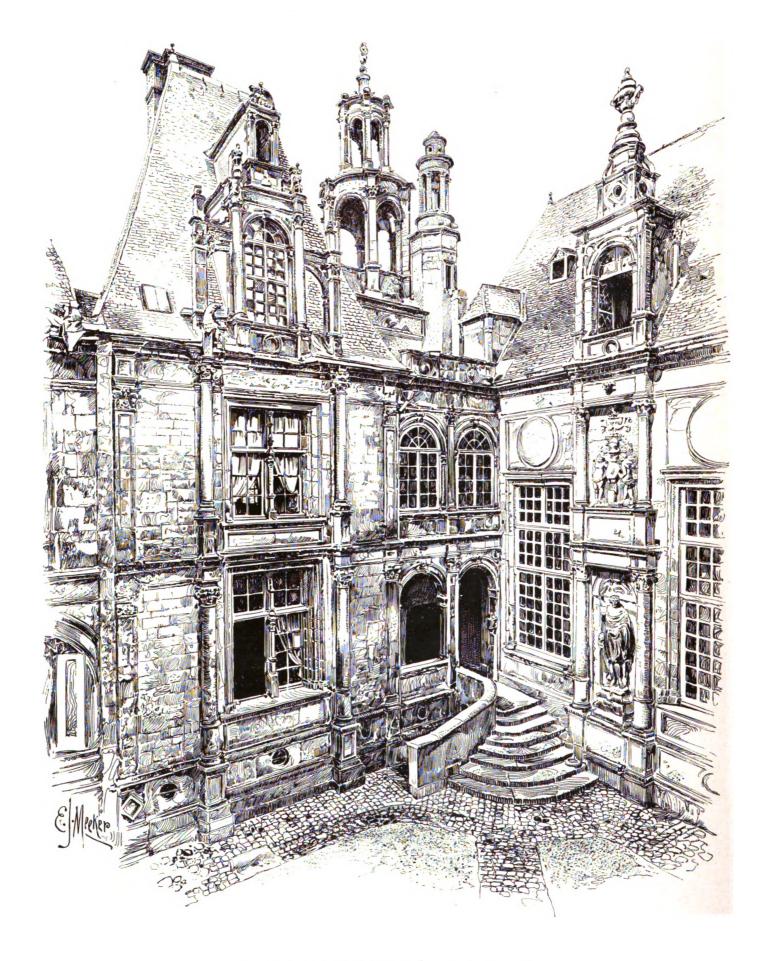

English contemporary, Engineering, recently, in discussing our expenditures for rivers and harbor improvements, said:

"The United States Congress annually votes certain sums to be expended in carrying out public works, such as harbor and river improvements. It would appear, however, that but little is done to determine, before passing the vote, whether such streams and harbors are really capable of improvement, for not unfrequently orders have been given to improve the navigation of streams which were never, in the best seasons, more than two or three feet deep, and, in fact, one case is recorded in which the sum of \$75,000 was voted for the improvement of two streams which, so far as could afterwards be discovered,

O

AILROAD STATION AT BUENA PARK, ILL. - BURNHAM & ROOT, ARCHITECTS.

THE ENGINEERING & BUILDING RECORD ILLUSTRATED SERIES.

HOTEL DE LA BOURSE, CAEN, FRANCE.

had no existence apart from the imagination of some Government official. On the other hand, in dealing with places like New Yorkand Baltimore the utmost parsimony is shown, and necessary improvements delayed for years, through the omission of Congress to supply the necessary funds."

The streams referred to above are the Clark and Mingo Creeks, and Captain William H. Bixby, of U. S. Engineers, in charge of the district in which they are, sets the matter right in a letter under date of December 10, 1887, to the Engineering News, in which he says: "You say, '\$75,000 was allotted for these streams.' matter of fact, no money has been yet allotted for the improvement of these streams, and only about \$400 for their examination and survey. Of Mingo Creek he further stated: "A steamer of 80 feet length, 30 feet width, and 5½ feet depth of hold, and about 80 tons burden, was then [at the time of his examination] making bi-weekly trips over the greater part of this river and carrying about \$365,000 worth per year;' and of Clark's Creek Captain Bixby says: "It is never dry, and during the greater part of the year is from 100 to 200 feet wide and from 9 to 12 feet deep."

It seems to be true that Congressman Aiken, of South Carolina, intimated that these creeks are streams "into whose beds water must be dipped from elsewhere to establish a commercial stream." The story grew out of the fact that the orders for the survey were sent by mistake to the engineer of another district, who, of course, failed to find the streams in his territory or on

his maps.

Streams and harbors are undoubtedly improved here as elsewhere which before improvement have at points but two or three feet of water in The source of the Chicago River had but four or five feet of water before it was improved; Buffalo Creek had but about three, and many of the lake harbors had even less depth at the mouths of the creeks forming them. The depth of a stream at its shallowest point is merely a matter of the estimated cost of the improvement. The total cost of the improvement and the probable accruing traffic are the two elements to be considered before commencing work.

Sir Charles Hartley says of the Rhine: "At certain places, at extreme low water, in dry seasons, the available depth is not more than two feet, in spite of the large sums of money which have been spent by the German States during more than half a century on regulation works of magnitude;" and it is understood that the magnitude;" Clyde below Glasgow was, before dredging,

fordable at low water.

Captain Bixby, in a letter to the Wilmington Review, which should be made a part of his official report, shows that an expenditure of \$462,000 applied to nine Carolina rivers and creeks has improved 582 miles, and the increased commerce on these streams amounts to \$8,150,000 annually, or an expenditure of \$800 permits a yearly traffic of \$14,000.

Although Engineering does not mention it, charges are freely made, by men of the Congressman Aiken type, that the passage of our River and Harbor Bill is accompanied by corrupt practices, and that a large proportion of the appropriations are for streams which will never become portions of any commercial highway.

Persons making such statements have been challenged repeatedly to show that five per cent. of the total money appropriated by Congress has been for such streams, and we believe the chal-

lenge still remains unaccepted.

In 1808 Secretary of the Treasury Gallatin said in a report to the Senate: "Justice, and perhaps policy no less than justice, seems to require that a number of local improvements sufficient to equalize the advantages should also be undertaken in those States, etc." The principle laid down by the Secretary has led to what is called "log-rolling," in which a small interest is aided by a larger one, or several small interests combine, but the corruption, if any exists, emanates from railroad interests, which object to the low freights necessited by efficient water communica-

The reason that New York is treated with parsimony is that New York is regarded as the centre of railroad influence and therefore as the headquarters of opposition to the improvement of rivers and harbors

Warner Miller, when Senator, stated the position to a *Tribune* reporter thus: "New York can get this appropriation of \$1,000,000 to start the Sandy Hook improvement, or she can let it alone and go on fighting the River and Harbor

Indiscriminate attacks by New York papers on proposed improvements in localities other than right at their door have destroyed much of their influence with Congress.

NO MORE BUILDINGS ON CITY HALL PARK.

WE are pleased to notice that Mr. Crosby has introduced in the Legislature a bill forbidding the city authorities to erect the new municipal buildings in the City Hall Park, and we hope it will be speedily passed. As the Tribune says: "The feeling that the only open space in the city between the Battery and Washington Square should not be encroached upon to the extent of a single square inch, has been shown unmistak-Whenever additional city buildings are needed the city should go elsewhere for a site.

STREET RAILROAD COMPANY CLAIMS DAMAGES FOR A STREET OPENING.

THE Broadway and Seventh Avenue Railroad Company has made a novel claim against Mr. Iames Fav. a plumber, of this city. Mr. Fay had occasion to make a connection with a sewer in Greene Street, and for this purpose was obliged to open the street, for which he had a permit from the Department of Public Works. The Railroad Company found it necessary to send a man to conduct the horses of each car around and past the opening. For this man's time the company has sent a bill to Mr. Fay, which, he refusing to pay, they threaten to sue for. It will be interesting to note the result of such a suit.

A PUBLIC meeting of prominent citizens of Augusta, Ga., was recently held to thank Congressman Barnes for the part he had taken in securing an appropriation for the Savannah River. A committee was appointed to use their influence in Washington and to secure appropriations for the carrying on of this improvement, which is deemed of such importance to the commercial prosperity of the city of Augusta.

NEW YORK ARCHITECTURAL LEAGUE MEMORIAL BELL AND CLOCK TOWER COMPETITION.

THE following were the awards in the "Memorial Bell and Clock Tower" Competition for the gold and silver medals of the Architectural League:

The Gold Medal-James A. MacLeod, Minneapolis,

The Silver Medal-William B. Mundie, Chicago, Ill. Honorable Mention-Julius Harder, New York City; William C. Noland, Philadelphia, Pa.; Timothy F. Walsh, Cambridge, Mass.

Forty-four sets of designs were received, and forty-three considered, one-signed with a monogram composed of two E's-being thrown out for non-compliance with the conditions.

The jury was composed of Richard M. Hunt, Charles F. McKim, and Russell Sturges.

NOTICE.—The author of the design bearing cypher three circles interlacing forming trefoil is not known. He is requested to send his address to Charles I. Berg, Secretary, 10 West Twenty-third Street, New York City.

OUR ARCHITECTURAL ILLUSTRATIONS. HOTEL DE LA BOURSE, CAEN ERANCE.

RAILROAD STATION AT BUENA PARK, ILL. - BURNHAM & ROOT, ARCHITECTS.

"OLD COLONIAL ARCHITECTURE AND FUR-NITURE."

UNDER this title Mr. F. E. Wallis has produced an extremely interesting and well-drawn collection of sketches and measured drawings of American work of the last and early part of the present century, together with some few examples of furniture such as were brought over from England by the earliest colonists of Massachusetts Bay. The examples are not only of early New England architecture, with much of which most architects are familiar but of less familiar work in the Middle and Southern States, which latter section has been little noticed, until THE ENGINEERING AND BUILDING RECORD published several interesting sheets of detail of such work now existing in the South, secured for it by the author of this work. It is interesting to note the variations in the work of the several localities.

In New England and Virginia there is much the same spirit. The work is English in character in both sections. but that of New England differs enough from its English prototypes to show that there were skilled workmen in that part of the country who worked with some degree of individuality, while the Virginian work is so evidently English in spirit as to confirm the traditions that most of the interior fittings and architectural features were executed by English workmen and sent to Virginia from the mother country.

Judging from the examples here shown, the Viginian work is much more elaborate and finer than anything that now, at least, exists in New England.

The old work of Maryland shows in as marked a manner the influence of French taste as its next-door neighbor shows its English origin. It seems not too bold an assumption that this difference was due to the fact that Maryland was settled by Roman Catholics and by Scotchmen. The Roman Catholics would naturally have strong intellectual and artistic sympathy with France. While the art of Scotland has always been influenced by that of France, and the relations between these two countries had been particularly intimate during the Jacobean period which immediately preceded the time of colonization.

The New York work has again a different manner, which Mr. Wallis, perhaps justly, ascribes to Dutch influences.

After the Revolution the work in the various sections is more akin than during the Provincial period. Most all this later work is strongly affected by French taste.

We miss in Mr. Wallis' book any systematic arrangement of the plates in regard either to subjects or localities. It is also to be regretted that he should so unreservedly have used the title of "Old Colonial," a misnomer only a degree less objectionable than that of "Queen Anne."

In the use of the word in an historical sense, very little of the work here illustrated is of the "Colonial" times: the bulk of the examples are of the "Provincial" period, while one-third of the plates show work executed shortly after the American Revolution and even later.

It seems to us well that the student should in the study of this old work, as of any other, not lose sight of the different social influences existent during these several periods.

What we have said in criticism of Mr. Wallis' choice of title is in no wise to be taken as in disapproval of his choice of subjects for illustration.

Indeed, the richest and best of the old work is that of the "Provincial" period, and the post-Revolutionary work here illustrated is very interesting and suggestive, and could ill be spared from the collection.

The later work is closely akin to the older, and all has the interest that pertains to the work of the handicraftsman before the use of machinery had robbed him of his sense of fitness, refinement, and proportion, and hence of any power to design his own details.

Mr. Wallis' sketches are executed in an artistic and very workmanlike manner; an architect himself, he has so chosen and presented examples of this work that they will be of very great service to the architect, while being none the less interesting to the amateur and the antiquarian.

Messrs. George H. Polley & Co., of Boston, are the publishers of the work. The price of one volume of sixty plates, bound in white cloth, with leather back, is \$25.

THE first day of the twentieth century will be Tuesday, January I, 1901.

PAVEMENTS AND STREET RAILROADS. No. XXVI.

(Continued from page 86.)

REPAIRING, CLEANSING AND WATERING.

THE following items are from the annual report of Mr. George R. Strachan, Surveyor to the Parish of Chelsea, London.

Complaint is made of an insufficient number of streetbasins, and that the gutter stones, from not being laid on concrete, have settled under heavy loads, so as to form depressions which hold the water. He states the axiom, that "a street on which water gathers is a dirty street, and a dirty street is an expensive street." The use of flints on macadam roads is condemned as being "dusty in summer and dirty in winter" under heavy traffic. Good granite is recommended, but not such as breaks into sharp, razor-shaped pieces. Large stones are a positive evil, and it requires much care to insure that the stones do not exceed two inches in the largest dimension. The paragraph on the wastefulness of macadam roads for streets carrying heavy traffic is worth quoting entire:

"Broken granite at its best is very wasteful as a material for maintaining carriageways where heavy traffic exists. A cubic yard of Guernsey granite costs the Vestry 125, 6d, on the wharf this year. The cartage of it to the carriageway, spreading, rolling, and consolidating it costs 95. 6d. more, or a total of 225. on the finished carriageway. It is there ground to dust in dry weather, and to mud in wet weather, and becomes, taking an average of all weathers and of the traffic weights in Chelsea, four cubic yards of slop or mud. These cost 105. 4d. for sweeping to one side of the carriageway, 65. for carting to the wharf, and then 45. 5d. for their disposal. From first to last the cubic yard of Guernsey granite has cost £2 25. 9d. In roads like King's Road one year's wear is the utmost that is obtained from it. The average life in the home district is obtained from it. The average life in the home district is only four years. The temporary use of the material at the large cost named brings vividly to the mind the un-scientific and wasteful character of macadam roads in heavy traffic, and points to the necessity of using a better and different class of material for carriageways in main thoroughfares.

As to the value of steam road-rollers the report states, that, after a contest in the courts, the right to use them has been maintained, the gas company having sought to restrain them on account of damage to pipes. One of twelve tons and one of ten tons are now in use, at a cost for each of 10s. 6d. per day, including driver, fuel, oil, etc. By the use of one 300 square yards can be finished per day, with a great saving to tradesmen on a street by the shortening of time occupied in repairs. Repairs by simply throwing stone loosely on the surface and depending on traffic to pack them is considered a cruelty to horses and an inconvenience to the public. Two gasmains have been cracked by the rollers, but the insignificant cost of their repair bears no comparison to the saving by the use of the rollers.

The following statement is given of the actual cost of repairing Harrow Road, the area repaired being 9,522 square yards:

•	£	s.	d.
Estimated cost	300	•	6
ACTUAL COST.			
477 scores	35	15	6
403 tons granite	311	14	1
216 yards hogging	52	4	0
13,500 gallons water		10	135
76¼ days horse hire	34	6	3
Labor	48	4	10
Roller.			
Maintenance (2 per cent. on £375)	3	15	0
3,500 galions water		,	715
Half ton coal		9	11/2
125 bundles wood		4	415
Six chaldrons coke	2	14	0
Æ	390	•	,
Below estimate	•••	•	

Cost per square yard, 9.82d. Average area rolled per day of 10 hours, 423% square yards, Average thickness of granite, about 1.38 inches

As to wood pavements, some which have borne a traffic of 550 tons per yard in width during sixteen hours per day for seven years are good for some time to come. These pavements wear most at the sides of the road where the water lies on its way to street-basins: the surface also wears uneven in the older portions. Hard wood has not proved satisfactory; when one block is defective it wears more rapidly than adjacent ones, and cup-shaped depressions are formed, instead of saucer-shaped as in the softer woods.

Of asphalt pavements Mr. Strachan says: "I venture to state that there is not a pavement in use so economical, healthy, and clean, and with so many advantages as asphalt. Its one disadvantage of slipperiness does not, in my opinion, outweigh its advantages.

The various carriageways now paved with it are in better condition than when first completed. "They make no mud, and are always wholesome. A heavy rain washes them clean, and an extra watering attains the same end."

The footways paved with asphalt mastic one inch thick are spoken of in the highest terms, although compressed asphalt is undoubtedly most durable.

The trouble from cracks in the latter and methods of overcoming were treated of in previous articles.

Flag-stone footways allow water to percolate through the joints into cellars unless they are laid on concrete.

"The main streets are swept daily, others three times and twice a week according to their importance. Six gangs of men are engaged in this work, and are assisted by four sweeping-machines and three scraping machines whenever practicable. The wood pavement is washed during dry weather, and the slop occasioned thereby is removed as quickly as the present system allows of. Street orderly weather, and the stop occasioned thereby is removed as quickly as the present system allows of. Street orderly men are regularly employed on the wood pavement to remove the horse-manure and the refuse. During the year 19,695 cubic yards of slop and street sweepings have been swept from the streets, and have been carted to the wharf at 2s. 3d. per load. These were shot into barges, and removed at the 8d per load.

swept from the streets, and have been carted to the wharf at 2s. 3d. per load. These were shot into barges, and removed at 1s. 8d. per load.

"By contract, the carts are to call at every house once a week at least, and the men are to ask for the dust. The system followed when an application is made for the removal of dust is for an inquiry to be made as to why it was necessary. If the contractor is at fault, he is informed of necessary. If the contractor is at fault, he is informed of the fact; if the servants have refused to allow the men to take away the dust when they called, their master is informed of that fact; and if the householder has been averse to having it removed weekly, he is urged on the ground of health to allow it to be taken each time the men call; and by these means it is endeavored to secure a regular and weekly removal of all the household refuse.

"The collecting contractor is instructed not to collect trade refuse as dust, and a strict watch is kept on what he delivers to the wharves

"The public grumbles at the local authority for its neglect in the removal of dust, yet they put out of the reach of the local authority the only means of doing the work well. The custom of tips is the curse of local effort. It demoralizes the men, it causes them to act dishonestly in removing rubbish that ought not to be otherwise disposed of, and it inflicts a great hardship on the poor."

For street-watering the price paid for water is od. per 1,000 gallons, and the cost has been £65 19s. 10d. per mile watered.

"Street-openings by gas and water companies cause damage to the roads and are an annoyance to the public. They may be necessary for the business of the companies as at present conducted, but they are an injury to the roads. I am convinced that sooner or later the local authorities of the metropolis will have to take united action for their own protection against the powers and customs of these bodies. I have already referred to the steam-roller case where the law has subordinated the rights of the public in the repair of the streets to the rights of these commercial undertakings. At the close of the year the law has been held to make the public liable for personal injury under the following circumstances: A water company placed an iron box in a York stone footway under their statutory powers. In time the stone wore below the level of the iron box and an unfortunate pedestrian tripped up over it and sustained serious injury. He brought an action for compensation, and it was held that the local authority was liable. In this case the local authority cannot successfully refuse to have the iron boxes fixed in their pavements, and yet they are required to keep the pavements up to the boxes. If the boxes were not there the pavement would wear equally and no injury would be caused. This is a serious liability. I have not objected to the Chelsea Water-Works Company inserting such works and apparatus as they deem necessary in the streets, but if these liabilities are to be thrown upon the vestry, it will be my duty to draw the attention of the vestry to the question. It is no light matter to engage in lawsuits with these companies, when one of them can spend £100,000 in law, and then pay 10 per cent. to its shareholders out of the annual revenue."

(TO BE CONTINUED.)

THE STRENGTH OF COPPER PIPES AS AFFECTED, BY HEATING.

It will be remembered that on the 19th of September last the steamship "Elbe," belonging to the Royal Mail Steam-Packet Company, while on her trial trip burst her main steam-pipe, killing ten men, no one escaping alive from the fire-room. As the pipe had been carefully made and tested to much above the pressure at which it burst, the accident was much discussed and its causes carefully investigated.*

We take the following from an extended report made to the Committee of Lloyd's Register by Mr. William Parker, Chief Engineer-Surveyor, and published in Engineering, believing that it will be of much interest to all makers and users of large copper pipes exposed to high pressures and temperatures. Mr. Parker says:

It has long been known that at certain temperatures which copper is very often subjected to during the process of working, it becomes very brittle; and it is also known that the range of temperature from the point of brittleness

that the range of temperature from the point of brittleness to the point at which copper is brazed is not very great, and that it is not an uncommon thing to burn a pipe during the operation of brazing.

In order to obtain some information on this point, and to ascertain something more definite on the behavior of copper at various temperatures, I had some experiments made on flat strips of copper.

1. I had a piece of good copper taken from a sheet, bent

I had a piece of good copper taken from a sneet, bent and broken cold.
 A similar piece was heated until it became red-short, and broke with its own weight.
 A piece was heated to about the above temperature,

allowed to cool and then broken cold.

4. A piece was heated to a temperature a little below that of the last specimen, and partially broken while hot, allowing the remaining part that was still holding to cool and then be broken.

The fractures of these pieces of copper are very interesting. The first piece broke with a silky fibrous fracture, the second, of course, was black from the effect of the fire, but in the case of the third piece, that had been raised to about the same temperature as the second one and allowed to cool before being broken, its tenacity and ductility were to cool before being broken, its tenacity and ductility were almost entirely restored. This experiment was repeated by testing some pieces in a testing machine, when the strength of the copper in its normal state was found to be 35,212 pounds per square inch with an elongation of 40 per cent. in a length of five inches, and having a contraction of sectional area of 39.9 per cent. After being burnt, then cooled and tested, the tenacity was only reduced to 31,337 pounds, and the elongation and reduction of sectional area were practically the same as that of the copper that had not been burnt. This experiment was repeated with copper strips that had been heated to a brazing heat, and other temperatures with similar results. and other temperatures with similar results.

and other temperatures with similar results.

The behavior of the fourth piece, and the appearance of the fractures were still more interesting. It was partially broken through while hot, and the appearance of that part of the fracture was discolored by the action of the fire; but the part that was allowed to cool had its ductility restored, and afterwards broke with a bright appearance. This experiment was repeated a number of times with similar results, and the appearance of the fractures corresponded exactly with the appearance of the fractures. corresponded exactly with the appearance of the fractures of not only the exploded pipe, but also the fractures of the other pipes that were experimented upon, and burst at pressures of 600 pounds and 780 pounds respectively. The only difference in these fractures was the depth to

which the crack, as shown by the discoloration, had extended, so that the appearance of the fractures of the exploded pipes and the pipes experimented upon was reproduced artificially by burning the copper and treating it as described.

From this it will be seen that a copper pipe may be overheated or even burnt in the process of brazing, and still the properties of the material be restored after it has cooled.

It might also be partially cracked through the copper It might also be partially cracked through the copper when at this dangerous heat, and that the crack would exist in a latent state and not be discovered until the pipe gave way. The small part of the material remaining intact being sufficient to hold the pipe together, and stand the hydraulic test of twice the working pressure without showing any signs of weakness.

The evidence given at this inquiry, and the experiments made during the course of the investigation, clearly point to the fact that an element of danger exists in the present practice of brazing large heavy copper pipes intended to

practice of brazing large heavy copper pipes intended to be subjected to such high pressures as are now so common; it is generally admitted that welds or brazed joints in any material must possess certain elements of uncertainty, and in the case of copper worked over a fire, these elements of uncertainty, as the above tests show, are greatly increased and should be eliminated.

and should be eliminated.

It becomes a question in my mind whether large steampipes such as these, intended for high pressures should not be worked cold, and instead of being brazed over a fire, riveted with butt-straps or lap-joints, or if copper cannot be riveted steam-tight to withstand these high pressures, whether it would not be wise to use solid drawn and the steam of the pipes or perhaps steel pipes, or perhaps even brazed pipes served with steel, copper, or brass wire.

A SANITARY convention will be held at Akron, O., by the State Poard of Health on January 25 and 26. Nineteen subjects are to be presented for discussion.

^{*}The pipe was 9% inches internal diameter, brazed together with a lap joint, the thickness of the copper being .276 of an inch. It had been tested on two occasions to 300 and 350 pounds per square inch, respectively. The pressure at the time of the explosion was about 150 pounds per square inch and had been at that point for tea hours or more.

不透射量与原料的工作用的形式的

THE CEMENT-TESTER AT THE POUGH-KEEPSIE BRIDGE.

THERE have already been used in the Poughkeepsie bridge substructure over 60,000 barrels of cement, of which 40,000 were required for the crib and caisson works and 20,000 for mortar and concrete filling of the masonry.

At least one barrel in every ten was tested, and, as many samples were prepared for treatment under different conditions and breaking at different ages, the work of testing was very considerable, and an easy, rapid, and efficient method was quite important.

Mr. J. F. O'Rourke, engineer in charge for the Union Bridge Company, devised the machine here illustrated, which was built by ordinary mechanics at a total cost of less than \$100 and works easily, rapidly, and very satisfactorily, and has tested all the cement used in the work.

Briquettes are prepared having a minimum sectional area of exactly one square inch; they are inserted in the jaws of the machine and contact secured and the scale-beam leveled by a slight movement of the eccentric shown in the end view.

The index weight is then rolled out until the sample breaks. If the sample resists the maximum strain due to the index weight it is rolled back to zero and a weight hung on the end of the beam sufficient to give a strain of 100 pounds on the sample. The operation is repeated until the specimen breaks, when the beam falls and the index saddle descending is engaged by its shoulders on the top bars of the frame, and, with the addition of the weights at the end, registers the breaking load.

In regard to water-waste and its consequences the report says: "The experience of all cities that we are in communication with, and where works have been in operation for any length of time, goes to show the damaging consequences attending reckless waste of water.

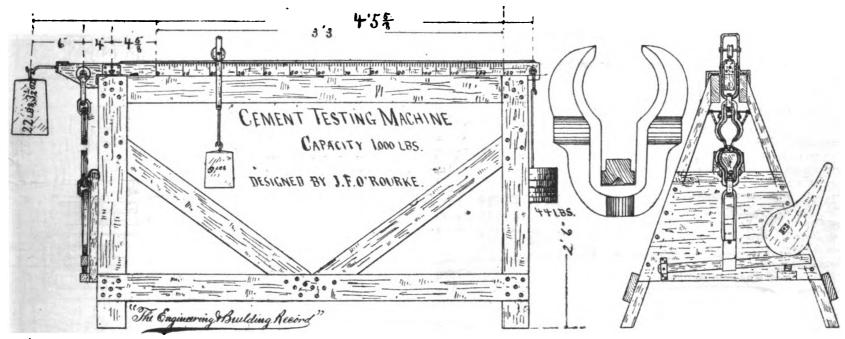

'But some will say, 'The works are owned by the city; we pay for the water, and we will use as much as we please, for it costs nothing to run it down hill; the works are no use if we cannot run all we please.' But they forget that the principal part of our interest account is for bringing the water to the city, and when they are allowing their taps to run in the winter to prevent freezing, instead of shutting off in the cellar, and in the summer to bring it cool from the mains, they are surely assisting to raise their own taxation for new mains, when the pressure for fire-service has become inefficient by the heavy draft on the gravitation main. When we take into account that water-closets alone under our pressure are capable of wasting about 10,000 gallons of water in twenty-four hours when they are kept open to prevent freezing, or with the mistaken idea of flushing the soil-pipes, and a 1/4-inch hose-jet over 15,000 gallons in the same time, it is easy to account for a water-supply running away before the city arrives at the size contemplated at the construction of the works."

The report cites the experience of Rochester, N. Y., and quotes the recommendation of its engineer, J. Nelson Tubbs, "That the city, at its own cost, should apply meters to all services."

Some of the meetings it will be noticed were exceedingly close, the error in one tunnel nearly a mile and a half long being only about one-eighth of an inch in line and grade, while in another considerably over a mile long there was no error in line and that in grade was not much more than one-thirty-second of an inch, although, as might be expected, the errors in line are usually much greater than those in grade.

THE WALLED LAKES OF IOWA.

THE Chicago Inter-Ocean says: "Along the watersheds of Northern Iowa there are a great many small lakes varying from half a mile to one mile in diameter. One of these in Wright County, and another in Sac County, have each received the name of "Walled Lake" on account of embankments that completely surround them. It has been generally supposed that these embankments were thrown up by the ancient inhabitants of the country. They are from two to ten feet high, and from five to thirty feet in width. Some who have examined them, however, declare them to be the result of natural causes only, and ascribe them to the periodic action of ice, aided to some extent by the force of the waves. The lakes are very shallow, and in winter they often freeze to the very bottom. The ice freezes fast to the earth below, and as in its expansion it acts in all directions, from centre to circumference, a certain part of alluvial deposit is forced to the shore, and this going on from year to year, and from century to century, has created the natural embankment.

The capacity of the machine is nominally 1,000 pounds, but it might readily be used to a much higher limit. It is very sensitive and has an initial error of less than five pounds. It occupies little space in operation, is very light, and designed to be readily taken apart and compactly stowed for transportation.

ANNUAL REPORT OF THE WATER-WORKS OF ST. CATHERINES, ONT., FOR 1886.

WE have received this report from the Superintendent, Mr. J. Albert Mills. It shows receipts for the year of \$7,992.65, and expenditures for maintenance and salaries of \$2,995.49. There were in use at the close of the year 19 miles of pipe, 145 hydrants, and 989 service connections. To avoid bursting the water-mains by too sudden closure of hydrants, when used by some careless driver of a sprinkling cart, ten "improved water-columns" have been put up from which to supply these carts, and the hydrants are not now opened except for fires. It is recommended that a fine be imposed for using the hydrants as hitching-posts, by which the nozzle-cap chains and their fastenings are sometimes broken or the joints started leaking.

The use of willows for holding up the banks of the canal was not a success, as the clay was too hard for the roots to penetrate.

An enlargement of the distributing reservoir is recommended, so that enough clear water may be stored to give a supply during the lengthy periods when the Beaverdams Creek is turbid.

MEETING OF HEADINGS ON THE NEW CROTON AQUEDUCT.

THERE are 44 tunnels on the New Croton Aqueduct, of which, on January 1. 1888, the headings had met in all but six, only one of which was over a mile in length.

Of those in which the headings have met, fifteen are more than a mile long, and their lengths and errors in line

and grade are given in the following table:

Headings.	Date of Meeting.	Error in line (feet).	Error in grade (feet).	Distance be- tween shafts (feet).
t S. and 2 N	November 19, 1887	0.00	0.014	6399.5

		. 1	٠,	•

The second one, "2 S and 3 N" is the one where the drills met November 1, 1887, as described in our issue of the 26th of that month, and the meeting of the first one, "I S and 2 N" on November 19 was mentioned at the

ENGINEERS' CLUB OF ST. LOUIS.

THE club met January 4. President Holman in the chair, W. H. Bryan, Secretary, twenty-four members and two visitors present. Robert H. McMath, J. W. Schaub, James M. Sherman, A. W. Hubbard, and Joseph F. Porter were elected members.

A paper by Mr. Charles H. Ledlie, entitled "Construction of Dam and Reservoir at Athens, Ga.," was read. The method of carrying out the work was given in detail and sketches of the principal features were submitted. The protection of this kind of work against crawfish and muskrats was shown to be of prime importance. Messrs. Moore, Holman, Johnson, and Flad took part in the discussion.

Professor Nipher then read a paper on "The Volt, the Ohm, the Ampere—What Are They?" being a mathematical discussion of the subject. The results were shown and their value to the electrical engineer explained. The paper was illustrated by suitable apparatus and drawings. Messrs. Holman, Flad, Moore, and Seddon participated in the discussion. Papers by N. W. Eayrs and Professor C. C. Brown announced for the next meeting. January 18.

Engineering of December 23 contains an illustrated account of a 1,000-ton hydraulic shears, built by J. Copeland & Co., cf Glasgow, for the Dumpeller Steel Works, for cutting steel blooms. It is capable of cutting steel slabs 30 inches broad by 10 inches thick at the rate of four cutto per minute.

THE NEW HARLEM RIVER BRIDGE.

This bridge, authorized by Act of Legislature, June 11, 1885, is now in an advanced stage of construction, and at the time of preparation of our maps, sketches, and plans, a few weeks since, the field-work was at a stage when all the different classes of operations were in full progress, and the extent, variety, and detail of methods and appliances well illustrated. No important portion had been completed except the caisson under Pier 2, which was accomplished by the ordinary methods of good pneumatic work.

The erection of the bridge is in charge of Commissioners Jacob Lorillard, Vernon H. Brown and Davil James King, with a corps of engineers, consisting of William R. Hutton, Chief Engineer; William J. McAlpine and Theodore Cooper, Consulting Engineers; John Bogart, Resident Engineer.

The entire contract was let for \$2,055,000 to the Passaic Rolling Mill Co. and Myles Tierney. The former construct and erect the iron superstructure, the foundations

Barr, sub-contractors, was completed end of April, 1887. Erection of iron work commenced about September 1, 1887, and steel arch, span No. 2, was closed December 17, 1887.

The prosecution of the work has been vigorous and successful, its construction sound and thorough, and its progress unusually free from accidents or unforeseen difficulties, except a greater amount of rock excavation under Pier 2 than was anticipated from preliminary rod soundings.

The work at site is notably interesting as an undertaking of much magnitude under plain, ordinary conditions, involving much high and heavy false work, and the handling and hoisting to a considerable height of many weighty pieces. The broken and precipitous ground and rocky banks, the necessity of preserving unimpeded traffic on the railroads and river underneath, and the limited and inconvenient yard-room, were the principal difficulties encountered.

Steam-power has been used wherever practicable, and

On the west side cars are drawn up the irregular incline by a wire cable wound on drum of an 8½ xto-inch Lidgerwood hoisting-engine.

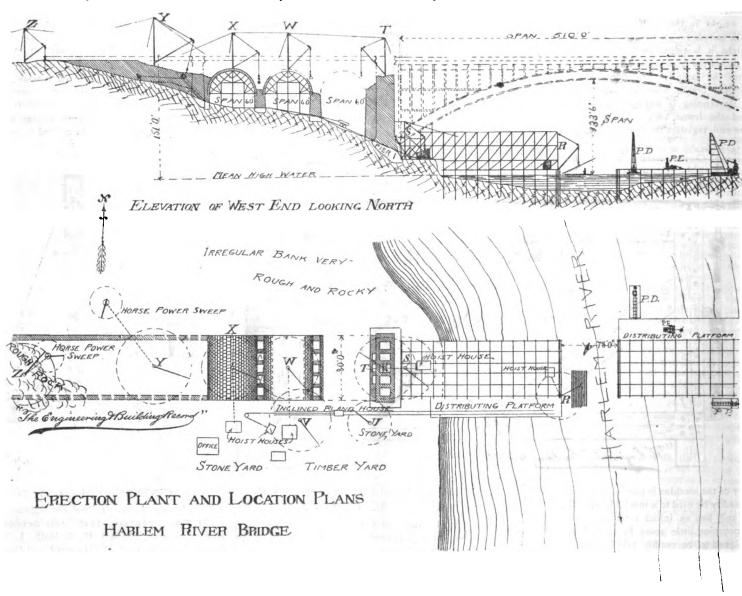

Materials for concrete are delivered by derrick L to steam-mixer C M, which automatically discharges into a hopper, from which it is received into buckets which are carried on small platform cars to the foot of the proper derrick.

Timber is received by raft or barge and is either removed from the dock to the place where it is to be used or stored in yard.

The iron is received on side track on east shore and deposited at foot of derrick, T D, or in yard, or upon skids, whence any members can be removed to points required for erection.

Members for span 2 are delivered to derrick T D, and transferred to car on distributing platform, which carries them to foot of hoist of erecting traveler derricks E T, E T.

There are hand-derricks in the yards at H, J, I, G, G, and U. Derricks A, Y, and Z are operated by horse-

and masonry being built by Myles Tierney. We give this week a sketch map and general plan of work, showing arrangement of plant and condition of work just before the last arch segments of span No. 2 were erected, and will supplement it in subsequent issues with descriptions and illustrations of the principal features and special details of the erecting plant.

The bridge is a public highway and crosses the Harlem River on the line of One Hundred and Eighty-first Street, New York City. It consists of two steel arches, each of 510 feet clear span, resting on granite-faced piers and abutments. The approaches are on masonry arches, with chambered spandrels, with gneiss rubble walls faced with granite. The bridge is graded in a parabolic curve from centre over main spans, and on tangents over the approaches.

All foundations are on solid rock, stepped off in horizontal planes; the eastern approach chiefly on concrete upon a softer rock.

Operations were commenced at the site in August, 1886, by Mr. Tierney. The submerged work, by Anderson &

the auxiliary structures and temporary work have been carefully designed.

As shown on the general plan, nearly all the excavation is completed, and the foundation courses laid, all but two of the approach arches have been laid, much of the sidewalls finished, main piers completed above the skew-back seats, one arch nearly closed,* and several segments of the other erected.

The total number of workmen at site is about 550, 300 of whom are employed by Contractor Tierney on substructure.

Three Rand drills at S D are supplied with steam from the adjacent boiler house near the end of the east approach, and the earth and rock excavation at both ends draws near completion.

Stone, cement, and other masonry supplies are received from the river and stored on the dock and in the yards indicated on the map, whence they are distributed as required and transferred to the structure by the mast and boom derricks A, B, C, D, E, F, F, S, T, W, X, Y, and Z.
*Span 2 has been closed and centres struck since this plan was made.

power, all others by steam.* The all-around derrick T D has an 8x12-inch Copeland & Bacon hoisting-engine; the erecting traveler derricks E T, E T, have an 8x12-inch hoisting engine built by J. S. Mundy, Newark, N. J., who also supplied those used in erecting the steel arch. The other hoisting-engines are nearly all Lidgerwood's make, from 6x8-inch to 8x12-inch,

Lerricks T, F, and P have the hoist-ropes carried down through the openings in the piers and led by sheaves to the hoisting-engines.

Derricks C, D, E, W, X, and Y, similarly have their lines led through the foot-block vertically down through the arch centre to the surface of the ground, and thence by sheaves to their respective engines.

There are two pile-drivers, P D, driving additional piles for the side false work, and a pile-driver engine, P E, for

^{*}These derricks have since been fitted with steam power, and an additional one set up near the one marked A. All but one of the 60-foot arches have also been turned, centering placed for the "7 centered" s6-footarch on east approach, and much progress made throughout the work.

hoisting timber from the water and erecting bents of false

A blacksmith and machine shop are located on east shore, the latter connected by a railroad track with line of bridge, and equipped with an engine, planing-machine, radial drill, punch, shears, lathe, and bolt-cutter.

The general arrangement of tracks, shops and derricks has been made with much care, and gives very satisfactory results in economy of time and labor.

FACTS ABOUT FIRES IN NEW YORK DURING 1887.

THE Fire Department of New York during 1887 answered 3,412 alarms, of which 98 were unnecessary, 132—were for indications of fire, and the rest, 2,912 for actual fires. Of these 2,634 were confined to the spot wherethey started and 173 were kept in one building, while only 37 extended to other buildings. Sixteen were on ships. Twenty-five buildings were totally destroyed, 101 considerably damaged, and the rest damaged slightly, or not at

AN ANGLO-ELECTRO-MECHANICAL BULL.

A VOLT-METER was recently ordered for the engineroom of an electric-light station at Chatham, England, with an 18-inch dial, so as to be readable at a distance of at least 40 feet; but, unfortunately, the only place where room could be found for it did not permit the observer to get more than two feet from the dial.

all. For the six years, from 1881 to 1886, 97% per cent. of all fires were confined to the buildings in which they started, and less than two per cent. of the buildings on fire were destroyed. Last year 98% per cent. of the fires were kept within one building, and less than I per cent. of the buildings were destroyed.

The estimated losses for the year on buildings were \$1,400,643, and on contents, \$4,171,862, a total of \$5.572,505, upon which there was an insurance of \$38,189,092. The uninsured losses were \$702,408. At eleven fires the loss exceeded \$100,000. The largest fire of the year was on May 27, when the Belt Line stables were burned, the loss being \$592,925. The burning of the Morgan Line pier in February, was the next largest conflagration, the loss being \$492,600. The third heaviest loss was that of the storage warehouse on West Thirty-eighth Street, \$345,325. After these no loss reaches \$200,000, the nearest approach being that at the fire at 221 to 227 Canal Street, on April 28, \$182,800, and at the Harlem fire of May 7, \$177,050.

The origin of the fires of the year was as follows:

latter only three deaths and no injuries occurred after the arrival of the firemen.

There were nine persons indicted, eight tried, and seven convicted of arson. The sentences varied from three years six months to sixteen years in State prison, except in one case where the prisoner was let off with three months in the penitentiary.

The department now consists of 960 officers and men, who make up fifty-three engine, nineteen hook-and-ladder, and two fire-boat companies. There are 338 horses in the department. An average of forty-four men are constantly on the sick-list.

Over 30,000,000 gallons of Croton water were used by the department during the year in putting out fires.

The Bureau of Inspection of Buildings considered plans for 4,344 new buildings, to cost \$67,068,200, and for 2,287 alterations to old buildings, to cost \$6,397,985. Only 2\frac{2}{6} per cent of the fires of 1887 were due to defective construction of buildings, as against 7 per cent. in 1880.

IS ELECTRIC WELDING RELIABLE?

E. J. RYVES, writing to the *Electrician*, states that the electric welding done at St. Petersburg and Paris is defective, the samples, though outwardly good, showing a very unsatisfactory state at the join when cut in sections, the metal being brittle and burnt where it had been under the action of the arc. He thinks it impossible to avoid burning the steel or iron more or less when the arc is used.

Some cut samples of electrical welding done in this country that we have seen looked very good but we should be glad to hear of any tensile or bending tests that have been made.

A SUGGESTION IN NAVAL NOMENCLATURE.

HER Britannic Majesty's new composite sloop has been named the "Buzzard." It will now be in order for our Anglomaniacs to memorialize Secretary Whitney to call our next new cruiser the "Skunk." It would be, at least, equally appropriate for offensive warfare.

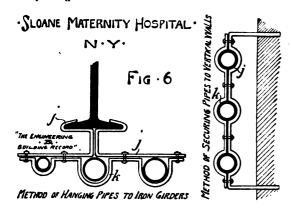

PLUMBING IN THE SLOANE MATERNITY HOSPITAL, NEW YORK.

No. II.

(Continued from page 106.)

The details of pipe system in laundry is shown in Fig. 5, and pipe-lines also in Fig. 1. The main pipe, G, runs through laundry at centre of iron beams, with a branch, I, extending down to boiler. The cold supply flows down boiler and out through pipe in bottom and up to waterback in range, returning hot into the side of boiler, thence passing out through pipe I to supply laundry-tubs with hot water. The cold supply to tubs passes through pipe I. Another branch from G runs down wall to range on the side opposite boiler, connecting with a copper clothesboiler at L.

The circulating-pipe, K, connects with cold supply under boiler, thence extending up back of boiler to ceiling and running parallel with J, connecting with it over laundry-tubs. A pipe branches from circulating-pipe K, near centre of laundry, and passes through heating-chamber and dining-room to recess C, thence up to attic, terminating over tank, and utilized as an expansion-pipe. This line is shown by K in Fig. 1. The laundry-boiler will hold thirty-five gallons.

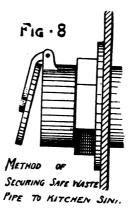

The laundry-tubs are secured by galvanized-iron pipes, as shown, with each end of pipe between the tubs entering into wall and securely leaded therein. Molded galvanized-iron legs support the front of tubs, and the rear rest on brackets of same material. A pipe runs also under the entire row of tubs.

The detail in Fig. 6 shows the method of suspending pipes from iron girders and to vertical walls. These hangers are made of galvanized strap iron, one inch in width. That part of the hanger indicated by j in the horizontal and vertical hanger is $\frac{1}{16}$ of an inch in thickness, and that indicated by k is $\frac{1}{16}$ of an inch in thickness. The upper part of horizontal hanger is made in two sections, which can be easily fitted on the iron girder, after which the lower part k can be put in position over the pipes and quickly fastened by bolts, and secured by nuts as shown. The inner section of vertical hanger j is let

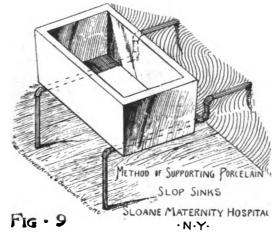

into brick wall and secured in position by lead filling: the outer section k is then fastened in the manner described above.

The detail of pipe system in kitchen is shown in Fig. 7. The boiler is made in two sections to permit it to receive the supply from both low and high pressure systems; the outer section containing the water from low-pressure and the inner from high-pressure system. All pipes shown in Fig. 7 suspended near ceiling are supported by pipe 1½ inches in diameter, with each end resting in brick walls, as shown in Figs. 1 and 7 at T'.

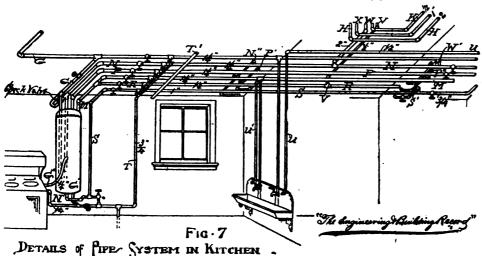

The water for supply to outer section of boiler enters through pipe G, passing down and out through pipe G', thence to water-back, and returning hot through G' into outer boiler, passes out through pipe M, furnishing hot water for fixtures in kitchen and adjacent rooms where required. The pipe M terminates in hall back of diningroom, as shown in Figs. I and 7. There are branches from G and M to kitchen-sink. Branches from G supply tanks for water-closets at D' and D'.

The expansion-pipe, R, branches from M near boiler, thence running parallel with M to dining-room hall, where

it terminates, as shown in Figs. 1 and 7. A pipe branches from R at V and runs up, terminating over tank.

The high-pressure supply from tank flows down through pipe W into N, and thence into top of boiler and out through P, thence up pipe S and through to room D', shown in Fig. I, and up recess in wall to third floor, with branches to supply cold water for toilet basins and sinks on first, second, and third floors. A pipe branches from S at S', thence running up recess E to fourth floor and utilized as a circulating-pipe. This branch is **\forall of an

· THE SLOANE MATERNITY HOSPITAL · N.Y.

inch in diameter. The pipe N' branches from N over kitchen-sink and runs up recess F, as shown in Figs. 1 and 7, furnishing cold supply for slop-sinks on first and second floors. Another pipe branches from N at W', and thence extends up recess E, supplying cold water for water-closets, bath-tubs, and sinks on first, second, and third floors and bath in attic.

The hot supply from high-pressure boiler flows up into pipe P, thence to room D', and up recess, supplying hot water for toilet basins and sinks on first, second, and third floors. A branch leaves P at P' over kitchen-sink, passing up recess F, supplying hot water for sinks on first and second floors. The pipe branching from P at P' in dining-room hall is half an inch in diameter and runs up recess E, supplying hot water for baths and sinks on first, second, and third floors, and bath in attic.

The check-valve is set in the pipe N on opposite side of bend. The pipe T is connected with pipes G, N, P, M, R, and S, by means of 1/4-inch branches, in which are set small hand-cocks, that can be utilized for draining water from pipes whenever required.

The pipes U and U' are safe-wastes, which discharge into kitchen-sink through orifices, which are closed when not in use by flap-valves, as shown in Fig. 8. This device is made of brass of any size desired, to correspond with diameter of waste-pipes, and screwed into back plate of sink, the waste-pipe being connected with it in the rear. The flap-valve closes the opening whenever waste water is not running through it, and prevents smells from kitchen ascending through it.

Figure 9 shows the method of supporting porcelain slop-sinks. These sinks are located on first, second, and third floors, and are elevated about 18 inches above floor, and set 12 inches from wall, the dimensions of each being 16x26 inches. Galvanized-iron pipes, about one inch in diameter, are utilized for supporting these sinks. The pipes are secured to floor, and fastened firmly into wall by means of lead filling.

The master plumber who executed this work was Mr. John Toumey, whose foreman in immediate charge of the work was Mr. John Dorman, the architect being Mr. W. Wheeler Smith, all of New York City.

TREE ROOTS IN SEWERS.

OUR Milwaukee correspondent writes that "a year ago the plumbers were kept busy removing fish from supplypipes, but this year no complaints have been heard of that kind. Besides the case reported in our issue of November 26, the same plumber found at a house corner Oakland and Cambridge Avenues in that city a willow tree which had been planted directly over the sever and had forced its roots in between the joints of the pipe, completely choking it. The sewers were laid some years ago, before the present system of sewer inspection was in force. Under the new rules it would be difficult for tree roots to get into a sewer, as the joints have to be well cemented."

MASTER PLUMBERS' ASSOCIATION OF THE CITY OF PHILADELPHIA.

The regular stated and annual meeting of the Association was held on the 12th inst. for general business and election of officers for the year 1888. A prominent feature of the evening also was an official visit by the members of the Executive Committee of the National Association of Master Plumbers of the United States, who had been in business session in the city during the day. The visiting members were Messrs. Byrnes, President; Trainer, Vice-President; Recording Secretary Gabay, Colonel Scott, Treasurer Lyons, and Hannan, of Washington.

The result of the election is as follows:

President, William M. Wright.

Vice Presidents, Albert M. Hicks, John J. Weaver, Henry McDowell, William S. Clark, Samuel W. Barnes.

Recording Secretary, Enoch Remick.

Corresponding Secretary, William S. Clark.

Treasurer, William Harkness, Jr. Sergeant-at-Arms, Samuel B. Fleming.

Board of Directors: William M. Wright, President; John E. Eyanson, John J. Weaver, Albert M. Hicks Enoch Remick, Secretary.

THE "Great Eastern" has been purchased by a firm of Glasgow metal brokers, with a view to breaking her up. It is estimated that the cost of breaking up will be from £10,000 to £15,000. It is stated that there are some 10,000 tons of iron plates in the vessel, apart from other materials.

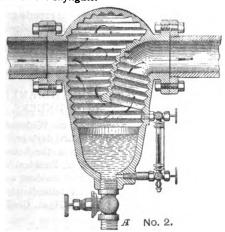

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

HINE'S GREASE ELIMINATOR.

STEAM in passing through an engine takes up more or less of the oil used in lubricating the valve and piston.

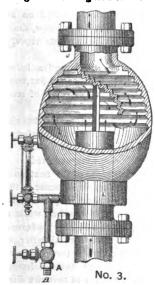

If this steam is condensed in an exhaust heating-system or otherwise, and returned to the boiler, the oil is apt to cause foaming and other troubles, and if exhausted on the roof it fouls the skylights.

As it is, the mixed oil and water are usually thrown away, while if separated they would each be valuable, for the use of the condensed water would save water bills and reduce scale in the boilers, while the oil could be used over again.

Such separation is the object of the device herewith illustrated.

Its operation is thus described by the inventor: "The exhaust steam upon entering the eliminator instantly expands, and, impinging on the corrugated and otherwise roughened surfaces, breaks up; the entrained oil, grease, and dirty water being expelled, adhere to the inner roughened surfaces, and gravitate to the bottom of receivingchamber and are discharged through the drain-valve "A," (which should always be left sufficiently open to allow a free passage of the oil and dirty water), while the clean dry steam, deflecting from the face of the depending partition is driven first down then upward in continuous contact with the roughened corrugated surfaces in its course.

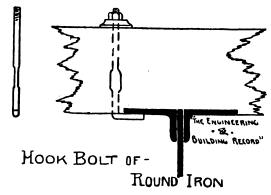

By extending a pipe from valve "A" into a sub-receiver, such as a barrel or tank, it will be found that the oil thus deposited is in no way impaired and can be used over again, care being taken to keep dirt out of the tank. As considerable water from condensation is discharged with the oil, passing together into the receiving-tank, the oil being the lighter will float, and can be skimmed or drained off, effecting thereby a saving of the cylinder oil, while grit or dirt being heavier than the water will sink to the bottom and be carried of when draining the receiving-tank."

The eliminator is the invention of Mr. F. A. Hine, and is for sale by lline & Robertson, 45 Cortlandt Street, New York City. Figures 2 and 3 show it as applied respectively to horizontal and to vertical exhaust-pipes.

A SIMPLER HOOK-BOLT.

PITTSBURG, PA., January 6, 1888.

SIR: In connection with your article on hook-bolts, which appeared in your issue of December 31, 1887, I would like to call your attention to the bolt which has lately been used quite extensively by the Keystone Bridge Company.

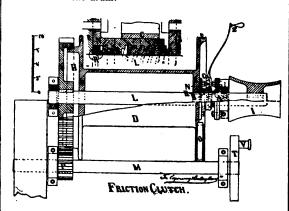

It consists simply of a piece of round iron bent and flattened at the lower end to suit the slope of flange and flattened again on the vertical portion so that when driven into a round hole it is wedged tightly enough to prevent turning under all ordinary circumstances. It is comparatively cheap to manufacture and experience has shown it FRANK C. OSBORNE. equal to its requirements.

IMPROVED FRICTION CLUTCH.

THIS clutch, designed by George E. Worthen and manufactured by Rawson & Morrison, Cambridgeport, Mass., is especially adapted for hoisting-engines, and intended to secure quickness, ease, and certainty of action with simplicity of construction. V is the crank-pin on disk T, keyed on main shaft M, which drives the drum-shaft L through pinion and gear P and S. A is a sleeve threaded on its exterior surface and bolted to flange of journal-box J. B is another sleeve or nut screwing on to A. A groove at one end engages the lip of flange N, which is made in two pieces and bolted to head E of drum D. N fits loosely on B and is recessed out to receive rings R of hardened steel. Clamp C is made in balves and bolted together so as to be adjustable to any required position on B.

The inside of rim of gear S is tapered and the flange H of drum-head is correspondingly coned.

The shaft L and winch-head I are always driven when engine is running, but the drum does not turn unless thrown into gear by moving lever Z. This unscrews B from A and thrusts the drum endwise against gear-wheel S, until the cone H engages the taper rim of S with friction sufficient to turn the drum.

The reaction of A and the longitudinal motion of L is resisted by a thrust bearing of grooves and collars at I.

Reversing the lever withdraws the drum and destroys

A large number of hoisting-engines are being fitted with these clutches, which are claimed never to stick or jam and to give perfect satisfaction.

The arrangement does away with a repelling spring and permits the drum-shaft to be of uniform size throughout. It also allows the winch-head, clutch-lever, and brake O to be on the side next to the engine and so near the usual position of the throttle-valve, and thus enables one man to control the engine, operate the clutch and friction brake, and tail the hoist-rope from the winch-head.

Winch-heads can be placed on both ends of the drumshaft if desired.

Correspondence.

All correspondents should s-nd us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

DISCUSSION ON STONEWARE VERSUS CEMENT SEWER-PIPE.

Office of City Engineer, DENVER, COL, January 6, 1888.

SIR: Can you cite files or pamphlets containing the discussion that appeared in print a few years ago Stoneware vs. Cement Pipe in Sewerage?"

H. C. LOWRIE.

[We do not remember any discussion on this subject. except an occasional spurt on the part of the manufacturers of either article. The fact is that good pipe can be made both ways, if none but the best materials and best methods are employed. But as it is much more difficult to judge of the quality of cement pipe after it is made than of stoneware, the former is generally regarded with suspicion. We should not recommend any city to use the cement pipe unless they had it made under their own supervision from materials of their own providing, using the best-known methods. It will not bear handling at once after making. Time is required to harden it.]

WHO BUILDS ICE-MAKING MACHINERY?

Office of the Board of Trade, ASBURY PARK, N. J., January 13, 1888.

SIR: Will you kindly inform me where the machinery or plant for the manufacture of i.e can be had, such as they use in Florida and other Southern States?

Respectfully yours, E. G. HARRISON.

[Referred to our readers.]

THE TREATMENT OF CONCRETE FOUNDA-TIONS IN STREET OPENINGS.

SIR: It seems impossible in a city like New York, which is continually demanding new appliances for comfort or dispatch, as well as repair of the old ones, to keep the street pavements, even when laid with care, from being continually taken up. And the only thing to be done in the premises seems to be to so arrange the method employed that the minimum amount of damage to the pavement and obstruction to the traffic of the street will be occasioned.

The method practiced by Mr. Deacon when City Engineer of Liverpool, as he once explained it to me, seems well adapted to the end in view. His plan was to remove the paving stones, and then, with straight, short picks, to cut two narrow channels through the concrete parallel to the sides of the intended ditch and then make narrow cross-cuts so that the concrete can be pried out in large slabs and laid on the pavement by the side of the ditch. The slabs should be cut about two feet wider than the ditch. After the ditch is back-filled the solid earth by the side of the ditch and under the undisturbed concrete is excavated to the depth of about eight inches and replaced by strong and very dry concrete; concrete should also be placed across the ditch to correspond in position with the cross-cuts made in the concrete. The slabs are replaced on these and the voids left by cutting the channels calked with rich mortar containing the least amount of water that will allow it to cohere under ramming. It will readily appear that the channels cut should be as narrow as possible.

In a few hours the pavement can be replaced and the traffic turned over it without fear of damage. Of course, the success of this plan depends on honest and thorough ramming, with intelligent supervision; though probably nothing would be done that would prove more unsatisfactory and wasteful than the present method of first breaking up the concrete into small pieces and then putting the fragments, which are not thrown in with the back-filling, under the pavement nominally to be used for fresh concrete after the poorly rammed ditch has settled.

EDWARD P. NORTH.

FANS SUGGESTED TO ASSIST SEWER VEN-TILATION.

PHILADELPHIA, December 29, 1887.

SIR: I observe in your issue of 17th inst. an article on sewer ventilation. Small connections with chimneys and flues, depending on natural ventilation, would, in my opinion, prove very inefficient in amount and very irregular and uncertain in working.

Digitized by GOGIC

It seems to me a good way to aerate underground sewers would be to locate an exhaust fan near a main sewer, drawing the air from the sewer and discharging it through a pipe or shaft above the neighboring houses where it would so quickly dilute as to be harmless. A fan with a capacity of 50,000 cubic feet per minute is not seriously expensive to build or maintain in running.

It might be attached to a main sewer of not less than ten feet diameter, taking care to trap the outlet if within a mile or two of the tan. so as to draw from the whole system rather than from the outlet. Taking a 5-foot sewer as above the average, the area is approximately four square feet, of which 12,500 feet when the sewers were empty would represent one minute's work of the fan, omitting allowance for friction of the air and for failure of fan to reach its imputed work.

In other words, two miles of average sewers could be aerated every minute, or a change of air once in five minutes of ten miles, or once in ten minutes of twenty miles of sewerage, could be effected by one fan, and the openings into the sewers, instead of being made for the egress of foul air, would be for the ingress of fresh air for aeration. The entire xtent which a single fan could aerate would, of course, depend on the grade and position of the sewers; the water-line must always be below the crown of the sewers to allow the sewer to be a part of the system. This, however, would fall within the care of the engineer in locating the fans and proportioning their size to the amount of communicating sewers for each district.

M. O. T.

[Fan ventilation for sewers has been tried and found wanting. It does seem at first glance as if it ought to accomplish the purpose, but it is found in practice that the friction of the air through long and more or less obstructed passages restricts the useful effect of the fan to very short distances, so that while a small hurricane may be drawing through the sewers near the fan those more remote are very little affected. Of course, a greater number of smaller fans would overcome this difficulty, but the complication and expense of such a plan preclude its consideration. Our correspondent's calculations would seem to imply that air is to be admitted only at the periphery of the system to be ventilated, and it is just because this cannot be done in practice that his scheme would fail. Even if it were possible to have no openings except at the points furthest removed from the fan, the difficulty of so proportioning them to the draught and friction in each case that the ventilation of connecting sewers should be anything like uniform would be an insurmountable obstacle.]

CAR-HEATING FROM LOCOMOTIVE ON THE CHICAGO, MILWAUKEE, AND ST. PAUL RAILROAD.

"The experiment of heating trains by steam has been successfully tested by only one Western line—the Chicago, Milwaukee, and St. Paul Railway—and now the through trains of that company leaving Chicago every day at 7:30 P. M., and leaving Minneapolis at 6:50 P. M., and St. Paul at 7:30 P. M., are systematically equipped with steamheating apparatus.

"No matter what degree of cold may exist anywhere along the line, an even temperature of heat is maintained throughout the interior of the train.

"As rapidly as possible all through trains on the various other lines of the Chicago, Milwaukee, and St. Paul Railway will be provided with appliances for the heating of its coaches by steam."

On reading the above from a recent issue of the Minneapolis *Tribune*, we wrote Mr. D. J. Whittemore, Chief Engineer of the Chicago, Milwaukee, and St. Paul Railroad Company regarding it, and have received in reply the following interesting communication from Mr. George Gibbs, their Mechanical Engineer:

CHICAGO, MILWAUKEE, AND ST. PAUL R. R. CO., MECHANICAL ENGINEER'S OFFICE, MILWAUKEE, January 3, 1888.

S1R: Yours of the 23d to Mr. D. J. Whittemore has been referred to me. I shall be most happy to give you the desired information as far as is in my power to do so. We have gone into the subject of safety car heating quite extensively in an experimental way in order to determine the best and most practical plan for a climate of extremes, such as we meet with in the North-west.

After examining the various schemes offered by inventors and the systems at present in use, we concluded that the most promising field lay in the use of steam direct from the locomotive Equipping a train last spring in this way with the Martin system, enabled us to try, in mild weather only, its reliability, and the steam consumption within a limited range of outside temperatures. These figures, which have already been published, demonstrated that for zero weather a mininum of 100 pounds of steam at about ten pounds pressure were required for each car per hour. This, you will notice, was far

above the estimates given by inventors and others; and although the loss to a locomotive might thus at times prove serious, we did not believe it actually prohibited further experiments.

The question of an iron car to be attached to each train, and to contain the heating arrangements, naturally arose, but from the acove computation it is evident that the drain from heating direct is less than that entailed by haulage of the additional car.

Starting from this as a basis, and from our experience with the Martin train, we have devised a system of our own with which to continue the experiments extensively this winter.

We have now equipped twenty-three cars and eighteen engines, and are heating our two through Chicago Minneapolis express trains regularly. Next week we expect to have a local train of six cars running in Minnesota.

I send herewith a blue print showing our method of platform connections and one of the automatic hose-coupling. The coupling belongs to that class in which the two portions are dissimilar, the male being attached to the hose and the female fixed on the platform. The construction will be obvious from the drawing. The female part consists of a hollow casing adapted to receive a thin flexible diaphragm carrying a metallic annulus in centre, which forms one bearing surface of the joint. This annulus is secured around hole in diaphragm by bending over the metal, thus allowing free expansive movement of diaphragm without danger of joint becoming loose. The diaphragm is held in place by a threaded ring carrying two projecting wings, which form the clamping device, with two similar wings on the male portion. The bearing of these wings are similar warped surfaces, the purpose of which is to form a lock when coupling is together. The coupling is effected in a vertical plane, parallel to that through axis of cars by placing the gasket of male portion on that of female and rotating ninety degrees, which brings the wings into contact. The purpose of the diaphragm is to insure an absolutely steam-tight joint, it being forced outward, when under steam, by the unbalanced pressure behind, tightly against gasket of male portion. It may be noted that in this diaphragm contact coupling the use of a soft gasket is avoided. Two soft metal surfaces make a perfectly tight joint, but we use one metal face and hardest grade of vulcabeston gasket in male coupling. Referring to diagram of platform: the couplings are connected across back of end sill; at points of junction with main train pipe a three-way cock is placed, allowing steam passage to either coupling or cutting off both. One line of hose only is used at a time, the other being kept in reserve in a "dummy coupling," ready for immediate use in case of accident.

The couplings are made the highest point in the system, the train pipe having a continual slope from them to centre of car. This point I consider is of advantage, making it unnecessary for the hose ever to be parted, and making freezing at the most vital point, through carelessness of trainmen, impossible. We found in case the couplings formed a pocket, as with most of the couplings on the market, that great care had to be taken not to let the locomotive be disconnected any great length of time at division points when changing on account of water lodging there and freezing rapidly through cold metallic surfaces. This matter of changing engines properly is, as may be imagined, difficult to regulate at times. The experimental stage can hardly be said to have passed yet, as we have had but little very cold weather and have several plans of piping on trial. The one insuring undoubtedly the most comfort to passengers, but entailing somewhat greater complication in piping, is that in which we combine ventilation with heating. In this we add to heating along trussplanks a compact radiator in each end of car. These are boxed in and have registers top and side. Near the flow on one side a connection is made directly with the hot air injection-pipe of our Spear heater. The motion of the train thus forces fresh air around radiator and out of top register. If car becomes too cold the injector is shut off, and the stack then acts as ordinary radiator by opening both registers. Suitable valves have been arranged to permit shutting off either side pipes or radiators, or both, as occasion requires.

I have no doubt of the ultimate success of some plan of heating by steam from the locomotive, but it would be rash to say that we have arrived at this stage yet; in fact, from our own experience, I know that no system in use now extensively will be a success in an extremely cold

climate without many changes. Too small pipes and projecting valves and nipples are absolutely certain to give trouble. Systems well devised for house use are not adapted for cars in winter. An increase of not less than fifty per cent. in pipe areas should be allowed to insure perfect circulation. We are trying two systems of automatic temperature regulation in two coaches. In these the inlet-valves are controlled and operated by regulating apparatus. In one system, the Johnson, a battery of three Leclanché cells in connection with a thermostat operates an electric-valve which admits air from the auxiliary reser. voir of the Westinghouse brake to the diaphragm valves to shut off, and open the same and control admission of steam to the piping. In three weeks of constant service no new defects have developed in the regulation and the coach has not varied 4 (four) degrees at any time when in service. We shall at some future time be glad to give you further particulars of the success of our experiments, if cl interest to you, and when the best plan for adoption has been determined will be glad to send you particulars. Trusting the above will be satisfactory, I am,

Very truly yours, GEORGE GIBBS, Mech. Eng.

THE ANNUAL MEETING OF THE AMERICAN SOCIETY OF CIVIL ENGINEERS.

THE annual meeting was held on Wednesday and Thursday, January 18 and 19. The first day's proceedings were opened by a business session at the house of the society, commencing at 10:30 o'clock, President Worthen in the chair, and a large number of resident and other members present. The polls were immediately opened for balloting for officers, and Messrs. Hunt, Gosling, and Haviland appointed tellers.

The annual reports of regular and special committees were then presented. First, that of the Board of Direction, stating that during the last year 116 members had been added to the roll, 11 of which were transfers from the junior and associate grades; 11 members had been removed by death and a few by resignation, leaving a present total membership of 1,110, greater by 91 than at the commencement of the year. The details of membership, etc., were presented, together with general minutes of the annual convention and the year's progress; 19 meetings of the society having been held in all, inclusive of convention, and 14 meetings of Board of Directors.

The Committee on Technical Training reported their recommendations that investigations, publications, and expenditures should, for the present at least, be directed in lines of interest to experienced engineers capable of criticising the solutions of practical problems, and that the advisability of primary education might be considered by the society if warranted by future ability.

The Library Committee reported an addition of 526 books and pamphlets, and 131 maps, drawings, etc., and presented detailed list of various reports received from committees and others.

The Treasurer's report showed a balance on hand of \$8,659.13, after having expended \$22,299.68 for various purposes, and stated the particulars of receipts, expenses, and investments.

The Finance Committee reported that all bills paids had been carefully audited and found satisfactory and properly charged to the respective funds.

All the above reports were accepted.

The subject of the place of the next annual convention was then introduced, and in response to the circular which had been issued to members requesting suggestions, 105 replies were in favor of Milwaukee, while a score or more of places in the East and South were favored by one to five members each. A very cordial letter of invitation to Milwaukee from 15 members there resident and the Mayor of the city was read, and another letter recording the enticing mean temperature of that city during the months of June and July for several years past was put inevidence. It was moved and carried that the next summer convention be held in Milwaukee at a date to be fixed by the Board of Direction.

The Committee on Uniform Standard Time reported steady progress in that reform movement.

A pamphlet had been prepared presenting and explaining the matter and furnishing complete information. This, with a list of questions, has been sent to the officials of the most important railroads. To the question, "Do you approve of the 24-hour system?" 61 replied in the affirmative and 38 in the negative; 76 were, and 21 were not, willing to adopt it in their train-service if connecting

branches would do the same. Many thought the system would be readily adopted by local residents and that it was a practicable measure. The system is now in use on the C. P. R. R. from Quebec to Manitoba and by several other roads and is to be adopted by others. It is highly commended in numerous letters from railroad officials and employees. The report was accepted and the committee continued.

The Committee on Joint Library stated, that while they believed such an arrangement with other societies should be consummated, they had been unable to make any satisfactory progress in that direction. The report was accepted and committee discharged.

The Committee on Rails and Wheels had been unable to complete preparation of report, and were continued and the filling of the vacancy made by absence of one member abroad was authorized.

Letters were read and followed by remarks from experienced members present, upon the definite employment and relative value of the titles resident, division, and assistant engineer. Much ambiguity was believed to result from the lack of uniform distinction, and a committee was appointed to investigate the matter and present recommendations.

The polls having been closed at 12 o'clock, the tellers announced the election of the following officers:

As President, Thomas C. Keefer; as Vice-Presidents, J. James R. Croes and Robert Moore; as Secretary and Librarian, John Bogart; as Treasurer, Georg: S. Greene, Jr.; as Directors, Mendes Cohen, Joseph M. Wilson, Stevenson Towle, Charles B. Brush and Alphonse Fteley.

Proposed amendments to the constitution were then introduced, and also amendments to the amendments. These had previously been presented in a circular from the secretary to members, and the main features were the raising of the qualifications for membership, the creation of a student grade, change of title of present junior grade, and some changes in the rules for election of members, and

in the by-laws. The points were of very general interest and elicited warm discussion, which was suspended at 13:30 o'clock by an intermission, while a collation was served in the society's rooms to members and guests present.

The meeting was called to order at 15 o'clock and briefly addressed by President-elect Keefer, and the discussion of amendments became general and animated, chiefly centering on the clause proposing a student grade. Letters were read for and against it, and a member of the British Institute of Civil Engineers explained at length the working of the system in that society. Some members believed that such a grade in this society would benefit both parties; others, that it would harm both; others, that it would be immaterial and practically inoperative; others, that it would lower the dignity and reputation of the society and lead to ambiguity and dissatisfaction; and others thought that all reasonable advantages might be extended and are now accessible to technical students without their having any connection with the society.

Resolutions were finally passed commending the first and last amendments and disapproving the others—viz., those relating to the proposed student grade, and to changing the name of the junior grade, and a committee was appointed to suitably prepare the proposed amendments for presentation to the society for letter ballot.

The Committee on Cements stated that the preparation of a considerable portion of the matter was delayed, and presented a brief report, which was accepted and committee continued.

A committee was appointed to arrange and recommend standard rain gauge observations.

The awards of Norman Medal and Rowland Prize were deferred, owing to absence of some members of the committee.

The meeting was then adjourned until evening.

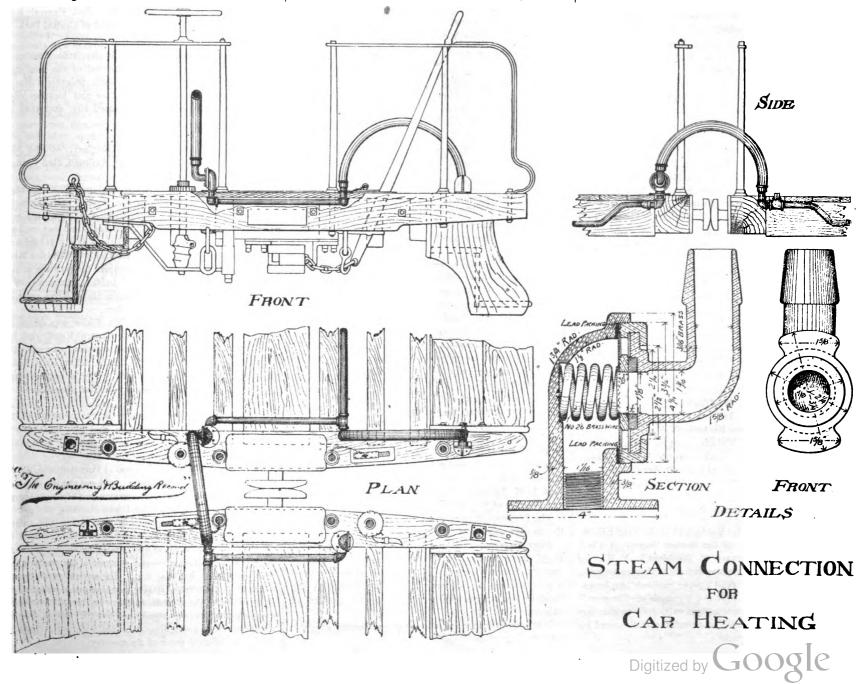

At 20 o'clock a full attendance of members, guests, and ladies were called to order in the hall of the Young Men's

Christian Association, near the society house, and Lieut. C. C. Rogers, U. S. N., was introduced by the chairman Mr. William G. Hamilton. Lieutenant Rogers was detailed by the United States Government to report on the condition of the Panama Canal, and, arriving at Aspinwall last May, remained for several weeks a guest of M. De Lesseps, accompanied him in his inspection survey, and was afforded every courtesy and facility for investigation by the company's engineers and officials.

This paper, of which a full abstract will be given in a future issue, was the record of these observations and investigations. It was illustrated by maps, profiles, and tables, and comprised a general description of the canal proposed, located and under construction, the nature of the country, conditions of work and attendant obstacles; stated the classification and division of work under contract, and approximate amount finished and required; outlined the methods and enumerated the principal items of working plant, cost of finished construction and future work; described the hospitals, offices, etc., and summarized the weight of evidence as indicating that the completion of the canal was only a question of time and money, about one-third of the work having been already done. A large number of interesting stereopticon views were shown, illustrating progress of work, principal machinery, houses, offices, landscapes, etc.

A vote of thanks was tendered to Lieutenant Rogers, and meeting adjourned until 9:30 the following morning, when the members met at the house of the society for an excursion to the new Harlem bridge.

The members met at the house of the society at 9:30 o'clock the next morning, and proceeding to the foot of West Twenty-first Street, embarked on the steamer chartered for the occasion, and were landed an hour later at High Bridge, Mr. Watts Cooke, President of the Passaic Bridge Company, and Mr. Myles Tierney, contractors for the new Harlem Bridge, received them, and, together with Engineers Hutton, Cooper, Bogart, Leers, and Brush and

heir corps of assistants, conducted them about the scene of so much interesting construction, which, though it spoke most effectively for itself in its magnitude and simplicity of detail, was more quickly and readily followed by their brief outline of methods and conditions, and the practical illustrations afforded by the working of nearly all the varied and extensive mechanical plant.

The wide platforms and stairways made the inspection of this work (description and sketches of which we publish this week) unusually easy. Returning to the steamer, a lunch was served and very interesting sets of photographs of the work just inspected were presented by the contractors to the members of the society, who so soon exhausted the supply that a second edition was promised.

In the evening a reception was held at the house of the society, the committee's report on constitutional amendments was received and accepted, and the annual meeting adjourned.

The remainder of a very pleasant evening was devoted to the lunch tables, conversation, and the proposal of toasts, responses, and speeches.

The following members and guests were among those present at the annual meeting:

William E. Worthen, Gen. George S. Greene, George S. Greene, Jr., William J. Haskins, Downing Vaux, Theodore Cooper, W. G. Hamilton, John Bogart, W. II. Paine, F. A. Calkins, C. C. Schneider, W. W. Maclay, W. Howard White, S. Willett Hoag, Jr., Joseph P. Davis, W. H. Wiley, A. W. Trotter, A. M. Wellington, A. P. Boller, Josiah Briggs, J. A. Bensel, J. J. R. Croes, J. P. Davis, C. E. Emery, J. F. Flagg, E. B. Gosling, J. R. Wardlaw, E. E. Magovern, H. W. York, J. W. Ferguson, C. E. Jackson, J. F. Lewis, W. A. Nichols, S. F. Morris, O. F. Nichols, E. P. Playle, J. F. Sorzano, J. G. Sanderson, F. W. Skinner, J. Thomson, E. B. Van Winkle, A. L. Webster, G. A. Just, S. B Downes, C. M. Harris, R. L. Harris, H. C. Meyer, William Gibson, Jr., Frank Waller, James Moylan, Frederick M. Kelley, George B. Cornell, T. D. Whistler, J. Hoehn, Jr., R. Hering, D. McN. Stauffer, F. R. Hutton, F. A. Lovecraft, A. P. Trautwine, Charles Hewitt, S. Stevens, B. S. Church, Frederick S. Cook, New York; G. Lindenthal, Pittsburg, Pa.; T. H. McKenzie, Southington, Conn.; F. W. Whitlock, Waterbury, Conn.; G. Leverich, A. G. Brinckerhoff, H. W. Brinckerhoff, Dickinson Macallister, Albert Lucius, Brooklyn; W. A. Smith, Brooklyn; E. E. R. Tratman, Brooklyn; E. S. Gould, Scranton, Pa.; P. Roberts, Jr., Philadelphia, Pa.; G. S. Rene, A. Fteley, E. P. Frost, H. Wemley, J. H. Stack, S. F. Olney, N. J. Belton; G. B. Nicholson, Cincinnati; C. Fischer, Trenton; M. Merriman, Bethlehem, Pa.; R. Moore, St. Louis, Mo.; J. Owen, Newark; A. B. Paine, Poughkeepsie; W. H. Baker, Fitchburg, Mass.; G. B. Francis, Providence, R. I.; E. Blorston, Providence, R. I.; G. C. Tingley, Providence, R. I.; W. Stow, Providence, R. I.; T. F. Brendlinger, Pottsville, Pa.; II. F. Bonney, Montreal; C. E. Goad, Montreal; T. A. Peterson, Montreal; J. W. Bacon, Danbury, Conn.; W. F. Booth, Poughkeepsie, N. Y.; A. F. Noyes, West Newton, Mass.; A. Pou, Talbotton, Ga.; R. J. Pratt, Albany, N. Y.; P. C. Rickett, Troy, N. Y.; B. Reece, Toledo, O.; W. A. Sweet, Syracuse; O. T. Whitford, Syracuse; G. W. Shaw, Louisville, Ky.; J. P. Snow, Woonsocket, R. I.; D. J. Whittemore, Milwaukee, Wis.; A. M. Connett, South Orange, N. J.: Robert Cartwright, Rochester, N. Y.; J. I. Fanning, Minneapelis, Minn.; D. Fitzgerald, Brookline, Mass.; W. L. Goodrich, Leominster, Mass.; H. H. Gladding, New Haven; A. B. Hill, New Haven; W. M. Hughes, Cleveland, O.: A. Haviland, San Antonio, Tex.; S. S. Haight, West Farms. N. Y.; C. W. Hunt, New Rochelle, N. Y.; E. W. Howe, Boston, Mass.; F. O. Whitney, Boston, Mass.; T. C. Keefer, Ottawa; A. W. Locke, North Adams, Mass.; W. H. Burr. Phœnixville, Pa.; Charles B. Brush, Hoboken, N. J.; F. Collingwood. Elizabeth, N. J.; Mendes Cohen, Baltimore; D. D. Clarke, Tacoma, W. T.; E. L. Corthell, Chicago; J. J. Schaefer, Newark, N. J.

THE BOSTON SOCIETY OF CIVIL ENGINEERS.
The monthly meeting of the Boston Society of Civil Engineers was held January 18, President L. F. Rice in the chair, thirty-one members and eight visitors present. Mr. Jerome Sondericker read a paper entitled "An Investigation as to How to Test the Strength of Cements," showing portions of apparatus used in experiments at the Institute of Technology. The question was discussed by several members of the society.

THE ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.

THE eighth annual meeting of the Engineers' Society of Western Pennsylvania was held at Pittsburg on January 17, 1888. The Treasurer reported total receipts, \$1,469.50, and total disbursements \$1,614.12; leaving a balance of \$161.69.

The Secretary reported that there were admitted during the year 1887, 39 members, and that the society had lost from various causes 13 members, leaving a total membership of 330—a net increase of 26 over last year. During the year ten regular meetings were held.

Mr. Alexander Dempster, the retiring President, read an address containing a résumé of the work of the society during the past year and urging active work for the coming year, after which the society elected the following officers: As President, Alexander Dempster; as Vice-President, two years, W. L. Scaife; as Directors, two years, T. P. Roberts, Charles Davis; as Treasurer, A. E. Frost; as Secretary, S. M. Wickersham.

This concluded the business of the annual meeting. In the regular monthly meeting ten new members were added. A paper was read by Mr. Thomas J. Bray on "The Manufacture of Welded-Steel Tubing," of which an abstract with the discussion will be given in a later issue.

THE NATIONAL ASSOCIATION OF MARINE ENGINEERS.

THE National Association of Marine Engineers met at Milwaukee, January 9, 1888. Among other business the resolution touching on too little help in the engine-room of lake steamers was amended to include ocean steamers, and was referred to the Committee on Legislation, who will bring the matter before the Board of Marine Underwriters. A committee of three, consisting of National Secretary Harris, National Treasurer Galway, and Representative Uhler, was appointed to revise the constitution, and the following resolution was adopted:

"Resolved, That the greetings of the National Association be and are hereby extended to the National American Shipping and Industrial League, soon to hold its annual session in Washington, and that it is the sense of the National Association that some measure is needed to foster and encourage increased shipping facilities, not only upon the high seas, but upon inland rivers and lakes. Our rivers and harbors need improvements, our seagoing shipping needs that protection that will enable American ships to compete with alien tonnage."

The committee representing the resolution was James H. Harris, of St. Louis, Joseph I. Kroch, of Milwaukee, and Andrew Gaul, of New York.

The association adjourned on the 13th inst. to meet in Baltimore on the second Tuesday of January, 1889.

ENGINEERS' CLUB OF KANSAS CITY.

A REGULAR meeting of the club was held in the club room January 9, 1888. There were twenty members and five visitors present. The minutes of the annual meeting and of the meeting of the Executive Committee were read and approved.

The following officers were elected for 1888: President William B. Knight; Vice President, Octave Chanute; Directors, T. F. Wynne and William H. Breithaupt; Secretary, Treasurer, and Librarian, Kenneth Allen.

Mr. Frederick B. Tuttle was elected a member. It was voted to ballot for the following amendment to Section 2 of the By-Laws: In place of "The annual dues shall be eight dollars (\$8) for members and seven dollars (\$7) for associate members and associates" for the word "seven" substitute "five."

The resignation of the Treasurer, to take effect at the next regular meeting, was accepted.

The Secretary read a communication to the Committee on National Public Works from Mr. John Eisenmann, Secretary of the Council, and presented for Mr. W. D. Jenkins a handsome framed photograph of the C. M. & St. P. Railway bridge over the Missouri at Randolph, and for Prof. J. M. Johnson, of St. Louis, a copy of his "Theory and Practice of Surveying."

The President then read his annual address, after which the meeting adjourned.

After the meeting the club repaired to the Brunswick Hotel, where an excellent supper was served to 22 members and four invited guests. That the affair was thoroughly enjoyed by all present may be inferred by the difficulty encountered in passing numerous motions to adjourn.

It is hoped that the annual supper may become a regular feature of the club.

THE NIAGARA CANAL PROJECT.

PRESS dispatches state that the old plan to build a canal around Niagara Falls has been revived by a bill introduced in Congress by Representative N. W. Nutting, of the Oswego district, "to create navigable ways between Lake Erie and Lake Ontario." This bill passed the House as far back as 1862 or 1863, but failed then to become a law. The canal, according to surveys which have been made, will only be six miles ln length, and will not cost more than eleven or twelve million dollars. The value of the canal as a water-power would, it is expected, pay for its cost in a very short time.

PERSONAL.

ARCHITECT G. B. FERRY, of Milwaukee, is dangerously ill.

ARCHITECT E. T. MIX, of Milwaukee, who has been suffering from congestion of the lungs, will spend the winter in Mexico.

EDMUND M. WHEELWRIGHT and Parkman B. Haven, architects, of Boston, have become associated, their office being 6 Beacon Street.

DR. JOHN S. BILLINGS, LL.D. (Edinb.), Surgeon, U. S. A., is to deliver a course of lectures before the Lowell Lecture Association of Boston.

MR. J. F. O'ROURKE, M. Am. Soc. C. E., left this week for Laredo, Tex., to take charge of placing foundation for new bridge of the Mexican National Railroad crossing the Rio Grande River, to be built by the Union Bridge Co.

MR. BENJAMIN F. CRANE, civil engineer, died in this city this week at the age of 71. He was born in Saratoga County and was connected in a professional way with the Croton Aqueduct, Erie Canal, New York Central Railroad, and was the first superintendent of Central Park.

G. W. McNulty, C. E., of this city, still remains at Niagara Falls prosecuting the renewal of the long-span Suspension Bridge there. The work progresses despite the severe conditions of temperature and location (completely enveloped by spray-saturated air), and they are about ready to set anchor-bars.

CHARLES H. FISHER, Chief Engineer of the New York Central and Hudson River Railroad, died January 18, in New York City.

The deceased was born in Lansingburg, N. Y., in 1835. His initiative labors were on the Racine and Janesville Railroad in Wisconsin, and later he was connected with the State Engineer's staff of New York, and was engaged in the work of constructing the Erie Canal. He entered the employ of the New York Central and Hudson River Road in 1860, and in 1868 he occupied the position of first assistant engineer, but resigned to take the position of chief engineer of the Lake Ontario Shore Road running from Oswego to Suspension Bridge.

On the 1st of January, 1869, Mr. Fisher was appointed chief engineer of the New York Central Road, and had charge of all the engineering work on that road until two years ago, when he was compelled to retire from active work on account of failing health. The deceased was a member of the American Society of Civil Engineers.

RICHARD EDWARD EMERSON BUTTFRWORTH, C. E., of Grand Rapids, Mich., died in that city on the 17th inst., from the effects of a stroke of paralysis with which he was stricken a few days previous.

Mr. Emerson was born in 1806 at Port Antonio, Island of Jamaica, British West Indies, and was the son of a captain in the British Army and commandant of Fort George

He was educated in England, and choosing the profession of a civil engineer, placed himself under the tuition of William Nicholson, of Manchester. He recalled the construction in 1830 of the first locomotive engine—George Stephenson's "Rocket"—and was one of the party which rode upon it on its trial trip. For several years he was engaged at Manchester in the manufacture of cotton, but later settled in the United States. In 1875 he made the pumping-engines and machinery for the Grand Rapids water-works, and was also identified with similar under-

n different parts of the country.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITIONS.

COLUMBIA, S. C.—At a recent meeting of the Commissioners for the completion of the State House, held in this city, the Secretary State House, held in this city, the Secretary of the Commission was directed to advertise the fact that on or before the 1st of February, the State House Commission will receive applications for the position of Resident Super-intendent Architect for carrying on the work on the State House, that such application must be accompanied by ample credentials both as to character and competency of the applicant. In accordance with the above resolution, all In accordance with the above resolution, all applications for the position of "Resident Superintendent" must be filed by the 1st day of February prox. J. S. Verner is Comptroller-General and Secretary of the Commission.

RICHMOND, VA.—Plans are wanted by the Masonic Temple Association, of this city, for Masonic Temple. The Association will a Masonic Temple. The Association will receive competitive plans from architects, and will pay the sum of \$3,000 for the plans adopted. A schedule of instructions to architects and any other information can be had by addressing the Treasurer of the Association, W. B. Isaacs, this city.

LANSING, MICH .- The Methodist Episcopal Society of this place wants plans for a church to cost \$25,000. For full information address B. F. Hall, Chairman Building Committee, this city.

ARCHITECTS have not yet been selected for new Y. M. C. A. buildings at Newark, N. J., Trenton, N. J., Bangor, Me., Wilkesbarre, Pa., and Canton, O. Also for an Odd Fel-lows' temple at Findlay, O.

WARRENSBURG, Mo.-Plans are wanted in this city for a court-house, to cost \$60,000, for Johnson County. Address the County Clerk at this place.

LINCOLN, NEB .- Plans are wanted at Lincoln. Neb., for a new court-house for Lancas-ter County, to cost \$200,000. The plans recently selected have been rejected, as bids submitted according to them exceeded the amount of the appropriation by \$50,000.

PLAINWELL, MICH.—Plans are wanted by the officials of Allegan County for a court-house, to cost from \$50,000 to \$75,000. A committee has been appointed to prepare a schedule of instructions to architects who may desire to submit plans in competition, who will report at the January meeting of the board. John Crispe, chairman of the board, Plainwell, Mich., will give any desired infor-

For works for which proposals are requested see also the "Proposal Column," pages i-iv-v-v11-v111-127.

Persons who make any use of the information they find in these columns we trust will not omit to mention The Engineering & Building Record as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and relable news for our "Contracting Intelligence." Information of importance sent to be exclusively, and not essewhere published, will be liberally paid for.

WATER. SEWERAGE, ETC.

SALT LAKE CITY, UTAH.—Mr. Lowrie, C. E., of Denver, Col., is engaged in making an estimate of the probable cash expense of a system of sewerage for this city, and also of ascertaining the best method of laying the same. As soon as his report is submitted further steps will be taken by the city officials.

Los Angeles, Cal — The Vineland Water and Development Co. has been incorporated, with L. H. Washburn and others at its head. Capital stock, \$100.000.

NAUGATUCK. CONN.—Concerning report that a systen of water-works were to be established the cour correspondent writes as follows:

Only to open books for subscription to shares.

Think that they will be all taken by summer."

MIDDLETOWN, N. Y.— Carroll Phillips Bassett, C. E., of Newark, N. J., is planning an improved sewerage system for this place.

READING, PA.—Concerning the report that this city was to issue bonds in the sum of \$300,000 to improve its water-works system, our correspondent writes as follows: "At this time nothing has been done except to present a report upon the necessity of having an additional supply, to councils, and a resolution to authorize a vote of the people upon the ques-tion of increasing the indebtedness of the city \$300,000, or as much as is necessary, for the \$300,000, or as much as is necessary, for the purpose of increasing the city water-surply. The resolution has passed Select Branch on the 9th inst., but has not yet been reached in Common Branch."

NEVADA CITY, CAL.—Concerning the report that the water works here were to be improved, our correspondent writes: "No steps have yet been taken toward the improvement of the city water-works. Some time ago it was proposed to increase the storage capacity by enlarging the reservoirs and to put in larger mains, but nothing has been done as yet. The water-works that supply this city are owned by a private corporation." a private corporation.

CANON CITY, Col.—Our correspondent writes: "The State is making preparation to put in water-works for the prison, but has not made any contracts yet, only to obtain lumber. Will give any further information when I can."

KANSAS CITY, Mo,-Considerable money is to be expended in this city in extending the sewerage system. Contracts will be let during February.

LEAVENWORTH, KAN .- All the bids for the 700,000-gallon pumping-engine have been declared excessive, and the Leavenworth Water Company has decided to advertise for new ones, to be opened February 20.

FRANKFORT, MICH.—Concerning the election on the water-works question here, our correspondent writes, under date of January II, as follows: "Water-works carried by fifty majority yesterday. Great rejoicing to-day.

WALTHAM, MASS,-Concerning the projected sewerage system for this city, our cor-respondent writes as follows: "The subject of the diposition of our sewerage is being considered by a commission composed or our own citizens. The general plan of mains and laterals in the city is already practically adopted, and as soon as the method of disposal is determined will undoubtedly be commenced."

SIDNEY, O.--Our correspondent writes from this place as follows: "On the 3d of this month we voted for issuing \$60,000 additional water-works bonds to improve our water-supply and it was carried. We want a competent eng.neer to prepare plans, specifications, and estimates, and when all is ready will advertise and let. We think of putting in a new steam plant, double sets of machinery, tu be wells, and about four miles of new pipe and revise the old pipe."

OCALA, FLA. - Concerning water-works matters here, our correspondent writes as follows: "Contract and agreement made with Jeter & Boardman, of Brunswick, Ga., to put 1.1 works and supply city with 50 hydrants on streets for \$2,500 per year for 25 years."

JERSEY CITY, N. J.—Our correspondent, on inquiry concerning water-works matters here, writes as follows: "No steps are being taken at present to improve the water-supply.
Will inform you when any are taken."

JAMAICA, L. J.—The Jamaica Water-Supply Company, having just completed its plant in the above village, has made application to the Town Board for permission to lay pipes through this town and furnish water from flowing wells, under a pressure of 50 pounds to the square inch, or equal to 150 feet head. The application will be considered by the Board

BOWLING GREEN, O.—The water-works question, which has been agitated here for several months, was settled at the polls on the 16th inst., and the system is to be built at once. Messrs. Ferris & Holliday, of Jersey City, N. J., have received the contract and are already making arrangements to begin over the contract. already making arrangements to begin opera-

_____ BRIDGES.

AYLMER, CAN.—Concerning the published report that two new bridges were to be erected here, our correspondent writes as follows: "Both bridges have been built, one a Queen, the other a Howe truss; both wooden."

JEFFERSONVILLE, IND.— Concerning the reported erection of a bridge from this city to Louisville, Ky., our correspondent writes as follows: "This city, under the constitution of the State, can take no step in a pecuniary way to construct the bridge, its debt now be ing over the limit. We are waiting now for certain legislation in Kentucky before pushing the enterprise, which will be procured in a few weeks, the Legislature being now in session. There is no doubt in the minds of the incorporators about the speedy completion of the

SUFFIELD, CONN.-The Berlin Iron Bridge Co., of East Berlin, Conn., has been awarded the contract for building two iron bridges for this town. The prices are as follows: Stoney this town. The prices are as follows: Stoney Brook bridge, 75 feet, \$1,550; Oil Mill, 128 feet, \$2,050.

MILWAUKEE, WIS.—A bridge will be built across the North Menomonee Canal at Muskego Avenue that will cost \$40,000.

WESTFIELD, MASS.—Concerning the report that several bridges were to be erected at this place, our correspondent writes: "No steps taken as yet; the bridges will probably be built by the New Haven and Northampton Railroad Company, as they are the proper parties to do so, and information desired may be better obtained of them." be better obtained of them.

RAILROADS, CANALS, ETC.

WHEELING, W. VA.—It is reported that the Wheeling and Harrisonburg Railroad will build a line from this city to Bowerstown, O.; also that depots will be erected in this city. Ex-Senator J. M. Camden can furnish details.

RICHMOND, N. Y.—A street railway is to be built here. The Board of Trustees can give details.

PLATTSMOUTH, NEB.--The Plattsmouth Belt Line Company has incorporated, and will build a belt line around the city, to cost \$1,000,000. Nathan Shilton will give details.

QUINCY, MASS .- John Quincy Adams, of this city, and Arthur Burman, of Boston, Mass., are at the head of a project to build a street railway in this city.

NEBRASKA CITY, NEB —A street-railway is to be constructed here. S. H. H. Clark can give full details.

GAS AND ELECTRIC-LIGHTING.

THREE RIVERS, MICH.—An electric-light plant is wanted here. Address the Town

THE PANAMA CANAL IN 1887.

Our readers will bear in mind that the estimates and opinions contained in the valuable and interesting paper of Lieutenant Rogers, of which we give an abstract on another page, relate, with the exception of part of the final note, to De Lesseps' original plan of a thorough cut or sea-level canal.

His recent modification which contemplates an elevated lake in the Culebra division, with locks on either side, will, of course, very largely reduce the required excavation, and for the present render the Gamboa Dam unnecessary, as the proposed Culebra Lake is expected to answer as a regulator for the waters of the Chagres River.

This modification is said to be proposed merely as a temporary measure to hasten the opening of the canal and diminish its first cost, the sea-level waterway being still promised as a finality, and our explanation is to prevent our readers from confusing the two plans or forgetting that the lock plan is of very recent adoption.

PLAN FOR VENTILATING MONTREAL SEWERS WANTED.

WE publish in another column a typical letter from the Secretary of the Montreal Board of Health. We do not mean typical of the Montreal Board of Health, for that we hope it is not, but of the methods too often employed by municipal authorities in need of professional advice on engineering subjects.

We do not suppose that any of the gentlemen composing the Montreal Board of Health would, if seriously ill, send to a New York physician a general statement to that effect and expect to receive in return advice of any value. Still less would they be mean enough to expect or wish the physician to give it without pay, and yet that is precisely what they have done in their official capacity, and the folly and meanness are as apparent in the real case as in the supposed one. They would not dream of taking such a course on a legal question of far less importance.

But suppose we were willing to give for nothing the advice which our professional brethren in Montreal might rightfully expect to be called on to give for pay, what would be the value of advice given on such vague and scanty data in a case confessedly of unusual difficulty, and what intelligent use could the Montreal authorities make of even the best advice without the assistance of a competent engineer? Let them, therefore, start right and employ a competent engineer to begin with. They need not go far for one. There are a number of capable civil engineers in Montreal. Of these we believe there are about a dozen members of the American Society of Civil Engineers, and one of these is the recently elected president of the society. We do not know whether any of these gentlemen are experts on sewer ventilation, but we have little doubt that any of them could give sound advice on the general question, and would know enough to call in a specialist when occasion required.

It is high time that all corporations confronted by important engineering problems should realize that sound economy as well as common sense call for the prompt employment of a skillful engineer. In such a case pre-eminently "the best is the cheapest."

THE ICE CROP.

ABOUT this time, as the old almanacs used to say, expect the cutting and storage of impure ice. As our readers know, it has been fully demonstrated that ice cut from water contaminated by sewage contains dangerous elements in the form of bacteria whose vitality is not destroyed by freezing or even by exposure to temperatures much below the freezing point. It has also been shown that a considerable amount of the ice which is cut and stored for summer use is taken from water which is more or less contaminated, this being especially the case with the ice cut on the surface of streams or rivers into which the sewage of large towns or cities is discharged and with the ice taken from certain large ponds or small lakes the water of which is contaminated either by municipal sewage or by washings of manure, etc., from the immediately surrounding water-shed.

This is, therefore, pre-eminently the time when health officials and sanitary inspectors, both State and municipal, should be observing the localities and conditions under which the ice crop is being harvested. It is true that they have little or no legal power in the matter, and that if they discover that ice from doubtful or dangerous localities is being stored they cannot prevent it by process of law, but it is equally true that in matters of this kind publicity is one of the best means of prevention, and that they have really great power in their hands if they publish the results of their inspections and observations.

Those who store ice of doubtful purity will usually claim that it is to be used only for packing purposes or in cold store-rooms, where it will not be allowed to come in contact with articles of food or drink. This distinction appears to be recognized in some laws on the subject; for instance, we notice the following item in a Milwaukee paper:

"The Health Inspectors will begin to morrow making an inspection of the ice-houses in the city. It is intended to rigidly enforce the new law requiring the separate storage of river-ice and that intended for family use."

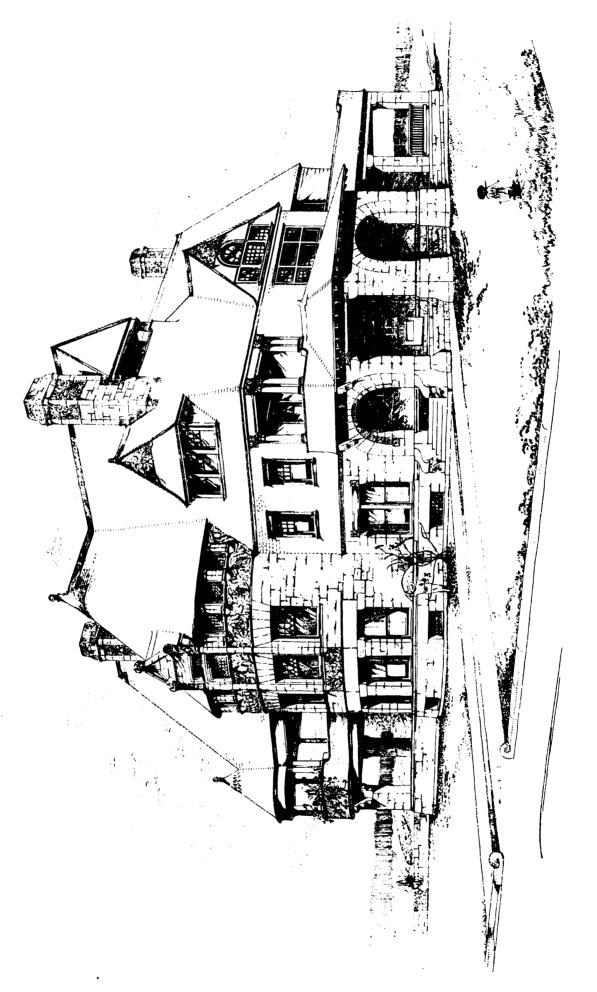

This sounds well, but we are skeptical as to the value of the results which will be produced by enforcing separate storage of impure ice, for the simple reason that it will be so easy next summer to mix this impure and cheaper product with that which has been more carefully selected. The rule which should be observed is a simple one. Ice should not be stored from any water or any locality which would not be accepted as a satisfactory source of water-supply for a town or city. For example, ice should not be cut from the Hudson River below Albany at a point so near any city or its sewer outlets that this point would be considered a dangerous one for the location of the intake of the city's watersupply. Ice in summer in this country is no longer a luxury of the rich, but a necessity for all classes, and the State Board of Health can probably find no more promising field of usefulness than the collection now of some definite and positive information as to the source and quality of the ice crop which is just being harvested.

LARGE ENGINEERING PROJECTS FOR NEW YORK.

It is stated in the New York Evening Post that a bill has been introduced in the Legislature incorporating the New York and New Jersey Bridge Company; capital, \$10,000,000. The directors are empowered to lease the bridge to any railroad corporation, or to consolidate with other corporations. George S. Field, William Libbey, and George Hoadley, of New York, are named as commissioners to locate the bridge, its approaches, etc. It is stated that the bridge shall be 135 feet above high water, plans to be approved by an engineer-commissioner to be appointed by the Governor.

. Application has also been made to the Board of Aldermen of this city for permission to construct and operate a system of railroad tunnels to connect with tunnels under the East and North Rivers with New Jersey and Long Island respectively. The names of those mentioned in the daily papers as being interested in this movement are: Walter S. Gurnee, Augustus C. Gurnee, Thomas Rutter, Frank K. Hain, Aqueduct Commissioner Oliver W. Barnes, General H. S. Huidekofer, of Philadelphia; Malcolm W. Niven, Everett P. Wheeler, Henry S. White, Colonel Robert Townsend, E. Platt Stratton, George R. Sheldon, and General Roy Stone.

OHIO STATE SANITARY ASSOCIATION.

THE fifth annual meeting of this association will be held at Columbus, O., on February 9 and 10. E. T. Nelson, Ph. D., of Delaware, President, and R. Harvey Reed, of Mansfield, O., Secretary. Among the papers promised we note the following:

"Santtation in Architecture," by D. L. Stine, Esq., architect,

Toledo.
"Cremation as a Sanitary and Economic Measure," by Lew Slus-

Children's Homes and Orphan Asylums," by F. H. Darby, M. D., Secretary Board of Charitable and Correctional Institutio

Morrow.

"Hygiene of the School Room," by Dr. F. C. Larimore, men

"The Necessity of Uniform Means of Reporting to Health Departments," by W. J. Scott, M. D., Professor of Clinical Medicine, Cleveland.

Village Boards of Health," by Austin Hutt, M. D., Waverly. Boards of Health and their Relation and Duties to the Public,"

by J. A. Martin, M. D., Findlay.

The Duty of the Public to Sanitary Science," by G. A. Collamore, M. D., Health Officer, Toledo.

House Drainage and Sewer Connections," by William Owens,

M. D., Cincinnati. The Ventilation of Sewers," by John McCurdy, M. D., member

Board of Health, Youngstown.

The Heating and Ventilation of Passenger Coaches," by R.

Harvey Reed, M. D., Mansfield. On Some Points in the Examination of Air," by Curtis C.

Howard, M. Sc., Professor of Chemistry, Starling Medical College,

'Pure Air Within Doors and How to Obtain It," by Prof. P. W. Search, Superintendent of Schools, Sidney

How Far Has the Science of Ventilation Advanced?" by Isaac D. Smead, Esq , Toledo.

"The Water-Supply of Toledo," by Daniel Segur, Esq., Secretary Toledo Water-Works, Toledo.

"The Germ Theory the Correct One for the Contagious, Endemic, and Epidemic Diseases," by A. G. Longfellow, M. D., Fostoria.

"The Necessity for Attention to Mental Hygiene in our Public Schools," by John C. McClung, M. D., Mayor of Leipsic. The headquarters of the association will be at Hotel LONDON CORRESPONDENCE.

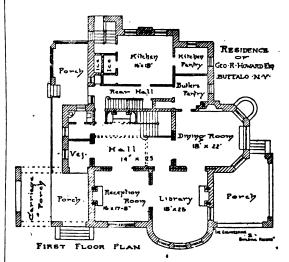

A NEW electric tramcar, destined for the service of the Australasian Electric Tramway Company, has recently been tried on a branch of the Wolverhampton Tramway Company, and has given satisfaction to the Electrical Engineers, Messrs. Elwell & Parker, of Wolverhampton. Secondary batteries, situated under the seats, and easily removable for recharging or other purposes, are employed. The working capacity of the accumulators is given as seven hours, and during the trial the speed attained was fifteen miles per hour on a level road, the car being also taken up a short gradient of 1-15 without difficulty. The motor is geared direct to the axles, and runs at the speed of 300 revolutions. Switches are at each end of the car.

THE destruction of the Grand Theatre at Islington by fire offers comment for those interested in fire-proof construction. The theatre was erected in 1883 (after destruction by fire the previous year), and the most non-inflammable materials known to the architect, Mr. Frank Matcham, were employed. The floors, staircases, and walls were all composed of concrete; the wall dividing the stage from the auditorium was of the same material, about three feet thick. The interior of the theatre, about 120x80 feet, is burned out and the roof off, but the interior architectural lines are traceable, as the concrete walls stand, although divested of all ornament; a small portion, four or five courses, and the coping, almost red hot, of the rear wall was the only portion that fell.

OUR ARCHITECTURAL ILLUSTRATIONS.

RESIDENCE OF G. R. HOWARD, ESO.

Our special illustration this week is the residence of Mr. G. R. Howard, Esq., at Buffalo, N. Y. It is of

brick and terra-cotta, with Akron tile roof and on portion of second story; hard wood interior finish. The architect was J. L. Silsbee, of Chicago.

ALTERATION OF HOUSE ON BEACON STREET, BOSTON, MASS. - ARTHUR LITTLE. ARCHITECT.

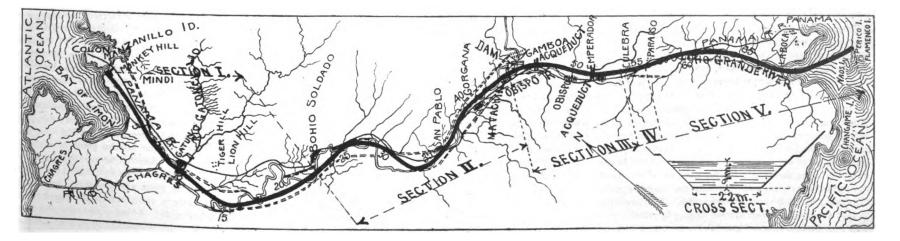

THE PANAMA CANAL IN 1887. BY LIEUTENANT C. C. ROGERS, U. S. N.*

DURING the months of March and April of last year the U. S. Steamer "Galena" lay at Aspinwall, having arrived there from a cruise through the Windward Islands and along the northern coast of South America. On the first of March, five days before our anchorage in Aspinwall, M. Charles de Lesseps, accompanied by M. Romaine, his secretary, M. Cottu, Administrator of the Canal, and other officials from the general office of the company in Paris, had reached the same port by steamer from France, and with M. Jacquier, the Director-General of the works, were occupying the handsome residence in the French quarter of Aspinwall that is usually assigned to the president of the company during his visits to the Isthmus. Their object was to inspect the canal and to arrange with the contractors for the future progress of the works. On the 9th I called on M. de Lesseps and the director-general and requested permission to visit the canal and authority to obtain from the officials full information concerning their respective fields of work. My reception at the hands of both these gentlemen was most cordial and pleasing, and was fully appreciated by me as an extension of hospitality and civilities to an officer of the United States Navy: it was such, too, as made me feel that my request could be stated frankly and would meet with favorable consideration. M. de Lesseps assented readily to my request, assuring me that all the information wished for would be furnished in full, that there was nothing to conceal, and that it was the wish of the canal company that the exact condition of the works and their prospects of completion should be known; he also invited me to become his guest and to accompany him during his tour of inspection. M. de Lesseps had inspected already the 17k. of canal open to water and was to resume the inspection the next day. I accordingly joined him at eight o'clock on the morning of the 10th, and proceeded with him by special train to Bohio Soldado, reserving my visit' to the sections of Colon and Gatun for a later date. The inspection thus begun lasted nearly three weeks, from two to three days being spent upon each section of the works. I thus saw every foot of the canal and of the auxiliary works, including the dam at Gamboa and the channels that are to deflect the Chagres and Rio Grande Rivers from the line of the great highway. Opportunity was also afforded me of seeing all the machinery and the methods of excavation, of inspecting the hospitals and the barracks for workmen, of studying the systems of administration and accounts, and, in short, of inquiring into all matters of organization, execution, and government.

The Panama Canal will extend from the entrance at Colon to the Isle of Naos on the Pacific side and will be 74k. long; its width at the surface will be 40m. and at the bottom 22m.; its depth will be 9m. Its excavation is entrusted to five wealthy contracting firms, each of which has charge of a division. The first division comprises the sections of Colon, Gatun, and Bohio Soldado, and is 26.35k. in length; the second is 17.65k. long, and includes

* Abstract of paper read before the annual meeting of the American Society of Civil Engineers, January 18, 1888.

The following abbreviations have been used in the paper : k., for kilometre; m., for metre; cm., for centimetre; mm., for millimetre; ma., for square metre, and ma., for cubic metre. It will be con venient to remember that a metre is about 31/2 feet, a kilometre about 5% of a mile, and a cubic metre about 1.3 cubic yards

the sections of Tavernilla, San Pablo, Gorgona, and Matachin; the third is composed of the sections of Obispo and Emperador, and has a length of 9.6k.; the Culebra section, or fourth division, is the shortest of all, measuring only 3.4k.; while the fifth division, of 17k. length, comprises the sections of Paraiso, Corozal, and La Boca, and terminates at Panama.

As regards the engineering problems involved, the company has established three physical divisions, each with reference to the difficulties that must be overcome. The first is 44k. long, and extends from Colon to the Gamboa hills at Matachin, the difficulty lying in the vicinity of the Chagres River. The second lies between Gamboa and the end of the Culebra and measures 11.8k.; it includes the sections of Obispo, Emperador, and Culebra, where are found the highest summits and the greatest quantity of rock and through which the deepest and most difficult cuts will extend. The third, 18.2k long, extends from the Culebra to the Pacific. Here the Rio Grande must be deflected from its course, and the earth is such as to admit of dredging throughout.

The American Contracting and Dredging Company is charged with the excavations in the first division. This firm has a capital of \$2,000,000. Mr. H. B. Slaven, of New York, is President of the company, and Mr. M. A. Slaven general manager on the Isthmus. Messrs Vignaud, Barbaud, Blanleuil & Co. have the second division; they have built several railways in France and have had some experience in the construction of internal canals. The third division is under the control of the Societé de Travaux Publics et Constructions, which has a capital of \$600,000 and enjoys a reputation in France and Brazil for very successful railway work. The fourth has fallen to Messrs, Artique, Sonderegger & Co., a firm whose members are young, capable, and zealous, and possessed of the energy needed to remove such a barrier as the Culebra. while Messrs, Baratoux, Letellier & Co., known chiefly for their work on French railways and canals, are engaged to open the fifth division to the waters of the Pacific within the next two years. These firms have guaranteed the execution of their respective contracts in nominal securities whose value varies from \$150,000 to \$1,600,000, according to the extent of the work required and the resources of the company undertaking it.

The excavation for 1885 was 8,212,000m³. Before this 10,205,318m³. had been extracted, so that the total excavation at the end of 1885 amounted to 18,417,318m³. January is a dry month in this latitude, and the year 1886 opened fair and gave a prospect of several months that would offer no serious obstacle to good and effective work. The following table contains for each section of the works the excavation for the year expressed in cubic metres:

Colon 1,555,000
Gatun
Bohio-Soldado 482,000
Tavernilla 63,000
San Pablo 388,coo
Gorgona 370,000
Matachin 172,000
Obispc 713,000
Emperador t,008,000
Culebra 608,000
Paraiso 449,000
Corozal 153,000
La Boca 1,211,000
Derivations 1,382,000
Accessory 342,000
Total for 1886

The average monthly excavation for the first half of the year was 1,057,333m³., for the second half 897,166, for the year 977,250. The largest excavation was made in March, 1,097,000m³.; the least, 828,000, was in December. The decrease for the latter half of the year is due to the wet season extending from May to December. The floods of the Chagres reach their greatest height in November, and, although the dry season begins in the next month, yet the labor required to repair the damages caused by the floods is such that this month shows the least amount of excavation. By comparison it will be seen from the table that the cube for the past year is nearly two-thirds of that excavated between the time of opening the canal and the first of January, 1886. The beginning of 1887 showed a total excavation of 30,414,318m³.

But to obtain a clearer idea of the present condition and extent of the works it will be better to consider the canal by divisions.

First Division—The first section of this division is that of Colon, which is 5.84k. long. It begins at Colon with a terre-plein, which protects the entrance of the canal from

the winds and from the action of the waves that would enter otherwise from the Bay of Limon. The site of the terre-plein was occupied formerly by a marsh; it required 236,000m8. of earth to fill the marsh and to raise it to an elevation sufficient to protect the entrance to the canal. The terre-plein is surrounded by a stone sea-wall, and on it stands the town of Christoval Colon, where the offices and quarters of the section employees are found. The present harbor of Colon or Bay of Limon is directly exposed to the sea and to the gales of this region. To avoid the consequent danger and inconvenience, the company decided to make a new harbor which should be called the Port of Colon. It will lie directly south of the terre-plein, and will be formed by Fox River-the channel separating Manzanilla Island from the mainland-coupled with the expansion of the first three kilometres of the canal into a The entrance to the basin will be 800m, wide. The width will decrease gradually to 500m. at the sixhundredth metre of length. This breadth will continue to the second kilometre, whence it will decrease again to the third kilometre, where the normal surface-width of 10m. begins. A curved breakwater of 1,500m, length will prolong the right side of the basin into the bay, and will further protect the port from winds and waves. The distance between the outer extremity of the breakwater and the nearest point of the terre-plein will be 225m., which therefore is the width of the entrance to the canal. This new port will not only afford security to vessels, but will also accommodate a large number of them and will offer every facility of wharfage for loading and unloading cargo. One-half of the first kilometre has been excavated to a width of 225m.; that of the remaining length of basin varies from 80 to 175m., gradually narrowing to 40m. at k. 3, which becomes now the surface-breadth of the canal proper.

The canal is open to water for 16.75k. from Colon, except at the Mindi hills, where a cut of 1,080m. remains to be completed. The greatest depth is 26 feet and the least 7, the average being about 16 feet. The Mindi cut has been chiefly through rock, and the delay in opening it to water is due to the wish to complete the excavation of rocks before letting in the water so that the work of excavation may not be impeded thereby. The excavation ex tends now to a depth of 3m. below the sea-level throughout nearly the entire length of the cut. The Mindi hills are then the only obstacle in the way of passing by water to kilometre 16.750, which may be styled the present head of navigation in the canal. I traveled from Colon to Mindi in one of the company's launches, which the Director-General had kindly put at my disposal. Crossing the Mindi cut, I went on board another launch, visited Gatun, deflections Nos. 1 and 2 of the Chagres River, and returning to the canal steamed as far as kilometre 16.750, where dredges were continuing the work of excavation. The Gatuncillo, Guarapa, and Vino-Tinto Rivers that formerly crossed the line of the canal are now cut off by a barrage in each and flow through deflection No. 2 of the Chagres. In the two sections of Colon and Gatun, eleven dredges were at work-four are of 60 horse-power and one of 180 horse-power, all of which were brought from Europe. The remaining seven are American dredges of 240 horsepower. Each can excavate 6,000m8, in 24 hours, though their highest yield so far has not exceeded 5,000m8. Their average excavation is 3,000m8, per day; this falling off from the maximum capacity is due to delays that cannot be overcome. Three hours in the middle of the day; for example, are lost, because the laborers will not work in the heat of that period, fearing its effects. Repairs to machinery, rains, stoppage at night or other causes of suspension have reduced the average cube to the stated amount. The present bed from k.17 to the end of the division has an elevation varying from 4 to 10m. above the sea, except near k.24, where there is a hill of 54m. original height, but which has been reduced to the levels of 12, 20, and 28m.

Second Division.—The crossings of the Chagres River form both the upper and the lower limits of this division, which it crosses 17 times in its length of about 17k. Between the k.32 and k.35 but little work has been done, but the general level for more than 10k. is 12m. above the sea. Throughout the remainder it varies from 8 to 12m., except in one hill of 25m. height, and a comparatively sudden rise to the same elevation at the end of the division. Dry-earth excavators are used in this soil. They are moved on parallel tracks by an engine of 8 to 10 horsepower, and their buckets empty the earth into cars on an adjacent track. Every facility for dredging is presented

here, not only by the nature of the soil, but by the Chagres River also, the depth of which is such that dredges can be put at every crossing. The excavation of the canal from Colon to k.44 at Matachin is thus comparatively easy. The problem throughout this length is the deflection of the Chagres, and the canal officials claim that it is solved. But until the deflections of this river are made and shown to be a success, all work in the second division must be delayed very much by the annual overflow.

Third Division .- Entering this division, the bed is on an elevation of 15m. above the sea as sar as Gamboa Hill, where 40,000m8, remain for extraction before the same level is reached. Five steam loading cranes are found here, each with a lifting capacity of four tons. The rocks are lifted by them into cars, which, when loaded are removed by an engine. Here, too, is the site of the great explosion of last year, when M. Ferdinand de Lesseps visited the works. The charge used was 2,500 kilos of dynamite and 1,250 of powder, which on exploding blew out 30,000m8. of material. A little further on is the famous Corrosita, still 45m. above the water. But the remarkable feature of this division is the great barrage or dam of the Chagres at Gamboa. From the canal bed at k.45 the river extends in a north-easterly direction past the villages of Gamboa and Cruces and between the ridges known as Cerro-Barucco on one side and the Cerro Obispo on the other. The central line of the dam will cross the Chagres at a distance of 500m. from the axis of the canal, The length of the dam at the base will be 300m., and the height of its crest will be 35m. It will contain 10,000,000m2. of material. The geology of the Gamboa district has been studied during the past year, and it has been found that the weight of the dam when complete will be sustained by the ground ceneath without the need of piling or other artificial support. The geography also is known. and no difficulty or expense, aside from the dam, will be involved for the successful formation of a lake to contain 3,000,000,000m8, of water, or three times the accumulation of water during the worst rainy season. Nature has furnished the other walls of the reservoir in the hills on each side extending up the Chagres and in the natural ascent and configuration of the valley towards Cruces. This lake will be discharged through a deflection of the Chagres, which will meet the river again in the bend north of k.44 and about 700m. from the axis of the canal. The deflection will be 1,200m. long and its capacity such as to drain the lake without causing an overflow in the lower course of the Chagres; but if, from wash or other cause, it should widen and permit a larger escape of water, its width can be diminished by filling in at the sides. It will thus be seen that the administration has abandoned its former plan of an elevation of 63m. for the dam, and that it has also given up the construction of a tunnel. The highest floods are reached between the 20th of

November and 5th of December, when the water rises to 8m. above the ordinary level. During the rest of the year the highest rise does not exceed 4m. In the valley of the Chagres the annual rainfall is 3m. A fall of 165mm occurred in one day of November, 1882. The usual discharge of the Chagres during the dry season is only 14m² per second; in the wet season it 134m³ on an average, and 666m² during the annual floods, which outflow ordinarily lasts not more than forty-eight hours. In 1879 there were extraordinary floods in the river, and the discharge was 1,930m³ per second for six days.

A railway has been laid from the terraces of the Corrosita to the terminus of the Gamboa dam at Cerro Obispo. and a bridge is now building across the site of the dam. The work of constructing the dam will begin as soon as the bridge is finished, when the trains will run out on the bridge and discharge into the valley below their load of earth and rock excavated from the Corrosita. The construction of the dam is much simpler than at first contemplated. The bridge across the valley is temporary, and the sections of Obispo and Emperador contain more than 18,000,000m8. of material, the nearest point of which to the dam is 800m. only. Another interesting feature of this division is the building of two aqueducts near Emperador to carry the water from the mountain streams on the northern and eastern sides across the canal to the Obispo on the other side. These aqueducts will be at the present levels of these streams, and vessels will pass under them. The bed of the canal rises from a level of 30m. near Gamboa to 55m. at the end of the division.

Fourth Division.—The level of the first 600m. is now 51m. above the sea, but the deep cut of the Culebra that follows has an elevation of 78m., except a small portion

Digitized by GOOSIC

7m. higher, which is being reduced to the same level. A better idea of work done here is obtained by remembering that the original elevation at this point in the axis was 108m., on the right side 140m., and on the left 120m. The sides have a slope of 45 degrees, and the width of the cut at the top is about 300m. The plant of this section is sufficient to do excellent work if properly utilized. There are available for this section 26 excavators, and 15 more are to be mounted; 42 engines, drawing 2,000 cars, are at hand to carry off the material as it is excavated over a network of railways. These tracks are carried around the sides of the Culebra and even prolonged over temporary trestle-work from 100 to 300m. long, over which the earth is precipitated to the hillside below. Two thousand workmen engaged with hand cars. Decauville cars, excavators, and loaded trains present a very animated scene.

A serious question in the Culebra is the accumulation of sediment and material resulting from wash, landslides, and fissures. In 1886, 78,000m8. of earth were washed or fell into the canal; and, according to the rate of excavation for 1886, it must have been the work of six weeks to remove it. This trouble arises chiefly from the slope on the left or northern side of the cut. On the right side the hill is formed of dolerite and sand, and no wash or slide comes from it. But the left side so far consists of strata of clay covered by a mixture of sand, alluvium, and conglomerate. During the rainy season this surface deposit becomes saturated with water, and the increased weight, coupled with the incline in the strata, causes the deposit to slip over the smooth surface of the clay into the canal bed. The clayin turn dries and contracts during the dry season, fissures result, and hence another source of landslides; and the natural wash of the sides by the heavy rains, sometimes torrential in character, is a third cause of deposit in the bed of the canal.

Worse still, the earth on this side has an annual movement of 30 to 45cm. toward the axis of the canal. The contractors acknowledge this to be a serious difficulty and one for which they have not found the remedy. But I am not inclined now to regard it as necessarily endangering the work, because the removal of so large a quantity of material from the sides alters the conditions of support. and, as the canal engineers say, it must change to some extent the position of the centre of gravity of the mass. And it seems natural that in such material a movement or settling would occur in accommodating itself to the new order of things-i. e., in regaining its equilibrium. Hence, I think, the company can view this without alarm. It is thought by the contractors that a bed of rock will be found at lower depths. We leave now the Atlantic slope, and the streams turn toward the Pacific as we enter the Fifth Division.

The soil in the upper portion is largely of clay and when wet its excavation is difficult. The level gradually decreases from 28m. next to the Culebra to 1.8m. at the Boca, the head of which is 6k. from the end of the canal. The average depth of this length is 5.2m., though for 11/2k. it reaches the full depth of 9m. in the axis at low tide. Ten dredges are now at work in this distance, each of which can excavate 2,000m8. per day. The Pacific terminus of the canal is near the isles of Naos and of Perico, whose anchorage forms the real harbor of Panama. The mean level of the Atlantic and Pacific is, of course, the same; but at Colon the highest tides do not exceed 58cm., while at Panama ordinary high tides reach 4m., and spring tides even 6m. To enable vessels to pass through at all stages of tide in the Pacific the depth of the canal for 15k. from Panama will be om. at low tide. The question as to the effect of this difference of tide level on the canal was referred by the company to the French Academy of Sciences. This body replied that it will not be such as to necessitate a lock. The Director-General, while not opposing the view of the Academy, inclines to the belief that any answer to this question must be based on theory at present; that as the canal is excavated the effect must be watched, and upon the practical knowledge thus obtained the final decision as to a lock or tidal gate must rest. The company has the plans for a tidal gate at Panama which will be built if needed.

Deflections of Chagres and Rio Grande Rivers.—
The canal is crossed by the Chagres twenty-eight times between Gamboa and Colon, and thirteen times by the Rio Grande between the Culebra and Panama. To prevent these streams from entering the canal, and to avoid the consequent dangers of current and overflow that would otherwise follow, deflections are cut in such a way as to

carry the waters of the rivers to the sea in beds on each side of the canal. These channels are known technically as the deflections of the Upper and Lower Chagres and of the Rio Grande. The former are the most important, as they are intended to solve the problem of the Chagres by drawing off the waters of the great reservoir at Gamboa and carrying these to the sea without overflow in the lower course. Beginning at the reservoir they extend across country from bend to bend, thus deflecting the river in a course nearly parallel to the canal, and transporting the waters by way of Monkey Hill, empty them into the Boca Grande, the arm of the sea east of Manzanilla Island, on which Colon is built. The aqueducts near Emperador, which will transport the waters from the north-eastern side of the canal across it to the present bed of the Obispo, prevent the need of deflections on the left side to carry away the latter stream. Conveying these waters, this stream will empty through its present mouth into what will then be the old bed of the Chapres, whence they will be transported by a series of deflections to the present channel of the Lower Chagres, which will discharge them into the sea through its mouth at Fort Lorenzo. The deflection of the Lower Chagres is really that of all the tributaries that enter the present stream on its lest bank, the most important of which are the Obispo, Arena, and Trinidad.

The first deflection of the Rio Grande will send its waters into the Quebrada Mallejar, whence they will pass by three derivations into the Boca.

The total length of the derivations will be 64k. Yet, the total excavation amounts to only 9.940,000m8. Their dimensions will depend upon the nature of the soil and the height of the ground. Lying as they do in valleys where feasible, the soil is alluvial and easy of excavation. Already 46 per cent. of the excavations have been made, leaving 54 per cent. to be done. The dredges advance at the rate of 25m. a day. Some of the derivations will be 40m. wide and 3m. deep; others 30m. wide and 5m. deep. Erosion will widen and deepen them to still larger dimensions. So far but one difficulty has been met in excavating the deflections. Occasionally an underground stream is met. which has an undermining action, and since the excavated material is thrown upon the banks of the deflection to give them all the height possible, the weight in some cases has been found too great where these streams occur and the banks have broken. So far repairs have been made-the engineers claim-effectively, and I see no reason to dispute their assertion.

Each section has its machine-shops and storehouses, which are of the usual type of frame buildings with corrugated iron roofs. The principal ones are at Colon, Matachin, and Panama. At the beginning of this year these workshops, with the hospitals, residences for officials. and barracks for laborers, if placed side by side, would have covered an area of 81.3 acres. The houses stand upon hills, as a rule, and near the line of the Panama Rail. way. They are frame buildings, whose sills rest on masonry supports; the roofs are of corrugated galvanized iron. They are clean, well-ventilated, and admirably suited to the climate of the Isthmus. They are rented to the contractors for ten per cent. of their value. Workmen quartered free of charge must pay for their own board. The canteens or boarding-houses are kept by Chinamen, as a rule, who have gained the confidence of the negroes, and who board them at rates that are reasonable for the Isthmus. The negroes and whites have separate barracks. I quite agree with Lieutenant Kimball, who says: These barracks seem to be well calculated for the purpose for which they are intended and are as cheap as anything that could meet the requirements of healthy housing in a climate like that of the 1sthmus. The native huts have proved very unhealthy and expensive, requiring constant repairs to the thatch, which, although a cooler roof than the corrugated iron, was found to be a fertile source of sickness from the decaying vegetable matter, as well as being a harbor for insects." The officers' and quarters of the officials and company employees are capacious and comfortable. And here I agree again with Lieutenant Kimball, who, on remarking that these have been criticized as too expensive, adds, that when it is considered that the death-rate would be larger yet, were not a great deal of attention paid to sanitary conditions and comforts, and that these establishments would be needed after the opening of the canal, it would be a poor economy to curtail the expenses in this direction within the limit of proper requirement.

In 1881 I crossed the Isthmus before a foot of soil had

been excavated from the canal. The only signs of habitation were a few rough huts at the railway stations; the whole country was in reality a thickly-matted jungle. To-day thousands of acres are cleared, and so great is the installation of the company that the canal and railway seem to lie in a populous and prosperous district. Indeed, the passenger from Matachin to Culebra is reminded by the canal property rather of one continuous settlement than of several railway stations. There are 185 kilometres of broad-gauge track and 116 of narrow-gauge on the line of the canal.

Organization.—The Director-General of the work is at the same time the head of the administration on the Isthmus. There are six bureaus, charged respectively with the correspondence, designs, finance, supplies, workshops, and transport by water. The "employees" are men who are in the service of the company, and by this term are distinguished from the workmen in the service of the contractors. Fixed employees are permanent receive a regular salary, regular leaves with pay and expense of travel, and a compensation in case of discharge. Temporary employees can be discharged at any time without extra compensation and are entitled to no unusual privileges from the company. There is a total torce of 926 employees and clerks.

When it is remembered that the work of each division is let to contractors, it seems odd that such a large force should be retained by the company itself, and one regards it naturally as unnecessarily large; the canal company so regards it. and I learned that steps are being taken to reduce the force very much-probably to nearly half the present number. The contractors are responsible for the excavation of each division and must carry out the plans submitted to them by the company. The technical bureaux of design or other work do not fall therefore within the province of the contractor. The accounts of the contractor's employees are really kept by the canal company's agents and such employees are paid by the paymasters of the company. In other words, the contractors are merely the agents of the company to excavate the canal and construct it in its entirety, while the administration to the smallest detail is in the hands of the company.

The pay of excavators is \$1.50 per day in Colombian silver, worth sixty per cent. of our money; mechanics receive a pay corresponding to the character of work required, which in some cases is \$5 to \$6 per day. At the time of my visit there were 926 employees in the service of the company, and 10,640 workmen employed by the contractors. The total force was thus 11,566 men. The laborers are chiefly negroes from Jamaica or other West India islands, with a few from Louisiana and other Southern States, who have gone to Colon in coasting vessels and have been attracted by the wages of \$1.50 per day in Colombian coin. Time contracts are unknown. The Government officials in the islands, particularly in Jamaica, discourage negro emigration to the Isthmus, and changes are arising constantly from sickness. dissipation, return home, or fear of revolution. Many are prompted to leave by the exorbitant rates of the Isthmus, by a lack of guaranteed hospital attendance, by fear of the climate, or by sufficient accumulation of money. The worst characteristic of the Jamaica negro is his indolence : he is a shiftless creature, who can subsist on little, and whose laziness prompts him to hoard his earnings for a few days and live upon them in idleness till exhausted. He gambles frequently, and would be healthier if he avoided the petty banker, who charges him usurious rates of exchange, and the saloons where brandy bought probably for twenty five cents a quart is sold to him for one dollar a bottle. This miserable liquor has probably caused indirectly as much yellow fever as the climate itself; in fact, from all I could learn, it contributes largely to what is called deadliness of the climate.

On Saturday the laborers are paid. Sunday is spent in dissipation or pleasure, Monday in recuperation, and it is not till Tuesday that a full force is at work, so that the number of working days in a month seldom exceeds 20 or 22. Twenty thousand laborers are wanted, and as the West Indies do not furnish them the company is trying to solve the difficult problem of labor in the populations of Western Africe 21. I Southern China. About 31 o Kroomen and as many Chi...amen recently brought out have shown themselves good workmen, and much is expected from the former especially, who come out acclimated, are temperate, large, able-bodied, and zealous workers.

The principal hospitals are at Colon and Panama, but physicians are assigned also to each section of the works.

Digitized by

There is, too, a sanitarium on Taboga, an island fourteen miles from Panama. The entire medical staff consists of 30 physicians and 50 apothecaries. It must be increased and other hospitals provided if additions are made to the force of laborers. The hospital service has been much criticised, and it has been charged that contractors discharge the sick, who die for lack of medical attendance. During my stay of six weeks on the Isthmus I saw nothing to confirm such statement. On the contrary, I saw cases of marked kindness and care on the part of contractors toward their sick workmen. Such a thing as discharge and neglect are possible under the system, but I doubt its occurrence very much. The hospital records show a death-rate of seven per cent., but this does not include those who, on account of illness or disease contracted here, have left and died elsewhere. From conversation with many intelligent men on the line of works and in Panama and Colon, I infer that the death-rate from all causes is not more than 14 per cent. at the highest estimate. The highest percentage of deaths from any single month was in June, 1885, at the Colon Hospital, where 36 out of 210 patients died, the per cent. being 17. The least is one per cent., in December, 1882. But the recorded average since the beginning of the work is seven

Double service is required of the medical staff, for it is compelled to serve both in the hospitals and along the line of the canal. Seventeen surgeons, assisted by apothecaries and several nurses in each case, are distributed along the line in the thirteen sections into which the works are divided. Their special duty is to attend the sick or wounded within their respective sections, to treat at home those whom they think can be kept there, and to send to the hospitals at Panama and Colon those who are in need of the care, treatment, and attention of such institutions. The Central Hospital of Panama consists of 16 pavilions separate from each other. Each is surrounded by a wide gallery, thoroughly sheltered from the rays of the sun. The pavilion where contagious diseases are treated stands apart from the others. These buildings cover a length of 1k. The cost of this hospital was \$832,724.97. Any person in the employ of the canal company or of the contractors is admitted upon a physician's certificate. The average number admitted to the hospital and discharged from it every month is 500. This number is composed of Europeans, Colombians, negroes, Chinese, and those who from wounds or other injury require surgical treatment alone. Eight experienced practitioners assisted by clinical clerks and students constitute the hospital staff. Severaj sisters of the order of St. Vincent de Paul assist the apothecaries in carrying out the orders of the physicians and in nursing the sick. The physicians are required to visit the patients at least twice a day.

The hospital at Aspinwall is a wooden structure near the seashore. It includes a central pavilion reserved for the sick and wounded of the company, contractors, and Panama Railway, of another for women, and of a third for strangers, sailors especially. This hospital is under the care of the Sisters of St. Vincent de Paul, and will accommodate 100 patients.

The sanitarium at Taboga was, until 1886 a building set apart on the island of Taboga for convalescents and agents of the company who needed recuperation from climatic effect or other cause of weakness. The building used was rented and proved too small for the applicants. The num ber of patients average 60 per week, and they now occupy a new building on the same island, the property of the company. One-twentieth of the number of beds are reserved weekly for the officials of the canal, who are admitted in the order of their application and are allowed to remain from Saturday until the following Monday only, unless a further stay be necessary for recovery.

On the 1st of January, 1886, one notices on the list of material 4 steam launches, 116 lighters, 29 tugs, 48 steam-cranes, 40 dredges, 81 excavators, with 30 ordered for the Culebra, 6,268 ordinary cars, 6,723 Decauville wagons, 88 centrifugal pumps, and 170 locomotives, besides a large plant of smaller material needed for such an enterprise. During the past year this larger material was increased by 3 tugs, 6 lighters, 23 dredges, 44 steamcranes, 60 excavators, 2,010 cars, 38 locomotives, 260 steam-cranes for loading, and 290 Decauville cars. The Société de Travaux Publics et Constructions are also credited with 1,000 steam-drills. I inquired specially about this, and was told that this number is really owned by the society. At the Corrosita, and in other parts of the society's sections, I noticed that they were used very liberally,

but their introduction is not as general as it could well be. At the present time there is undoubtedly a fine plant. The machine shops are well equipped, and capable of meeting the requirements of the enterprise. The American excavators are better in rocky ground than the French chain-of-bucket machines, which are best adapted to soft earth. The buckets of the latter have a greater capacity than those of the American machine; but our excavators are preferred by some of the contractors on account of their superiority in stony ground. The small cars are used too much. I noticed many hundreds of Decauville cars where excavators and trains of large cars could have been used to far greater advantage. As already stated to you, the second division is crossed seventeen times by the Chagres, and the delay in putting dredges to work on this section is to me inexplicable. Although preparations were making for it in two or three places, yet there was not a dredge actually at work. This and the last divisions are both easy of excavation, yet the work done in them is n.uch less in proportion than elsewhere.

Up to now the Decauville dumping hand-cars have been used in preference to any others for dry-earth work, for neither the French or American excavators have proved satisfactory, but in water the dredges have operated with good results. The Decauville hand-car consists of only two pieces, the cast-iron truck with four wheels, and the box of iron plates secured with rivets, which is of the capacity of half a cubic metre, and requires only two men to work it. These little wagons have been more useful than the large ones, which, owing to their great weight, have not been well suited to the work, as they need too many hands to move them. Half of the cube extracted up to date has been the work of this ingenious apparatus.

Each dredge has seven steam-engines, which develop together a horse-power of 300. Two of these engines move the bucket chain; two others of 30 horse-power move the hull of dredge, and two others elevate and depress the bucket beam. The seventh engine is employed in working the stump-extractor. Then two steam-pumps of 40 horse-power supply about 40,000 gallons of water per hour, which is thrown upon the buckets when they are at the top of the chain, and serves to wash out their contents. This, however, requires only one pump when the earth or mud loosens from the buckets easily and passes through the discharge-pipe.

Three large tubular boilers, fed by a condenser, furnish the steam needed for all these operations. Each bucket is lifted to a height of 45 feet above the line of flotation, and there emptied into a tube of three feet diameter and 150 feet length. In working, the dredges are 15m. from the bank of the canal. The buckets contain .79 of a cubic metre. They move at the rate of 16 buckets per minute, producing 7.854m³. in ten hours of work. The dredges at work on the Atlantic side have given the best results. Those on the Pacific side have met with mishaps and have not worked so well. What is wanting is not machinery, but the laborers to utilize it.*

The resources of the company have consisted in the original 600,000 shares of 500 francs each, or 300,000,000 francs, and in four issues of bonds as follows:

```
1. 250,000 bonds of 500 francs, 5 %, realizing 437½ francs each.
2. 600,000 " 500 " 3 %, " 285 "
3. 387.387 " 500 " 4 %, " 333 "
4. 458,802 " 1,000 " " 450 "
```

In August of 1887 another loan was made—500,000 bonds of 1,000 francs each, payable in 48 years; have sold 258,887 at 440 francseach, thus producing 113.910,281 francs. The company has thus received the sum of 1,030.943,180 francs. On the first of September last the company had in cash 213,910,280 francs; subtracting this sum from the former the company had expended on that date 818,032,900 francs.

The first three issues are redeemable in 75 years, under a system of semi-annual drawings, by which a given number are redeemed yearly. The last issue is redeemable at 1,000 francs in 42 years, a given number being redeemed every two months by drawings.

The total sum realized on the first of last March was 936,607,809 francs, or \$179.771,190, the amount spent on that date amounting to \$134,084,729. Since then a new loan has been raised; in other words, the obligations of the company, with expenses in the meanwhile, have con-

sumed the difference between these sums, and the actual expense so far has been nearly 180 millions of dollars.

Of this sum, one-fifth, 36 millions, may be regarded as the cost of the quarters for officials, barracks for workmen, and the present plant of machinery; 18 millions were paid for the Panama Railway; and the remainder, 125 millions, has been expended in salaries of officials and employees, pay of workmen, and general expenses of administration, repair, and execution.

In 1870 the traffic of the Suez Canal was represented by 435.911 tons of shipping; fifteen years later, in 1885, it had increased nearly twenty-fold, for the tonnage was 8,985,411. The revenue in the same time had increased from 5,159,327 francs at the former to 62,207,439 francs at the latter, or about twelve-fold.

M. Levasseur, Member of the Institute, has estimated that if the canal were opened in 1889 the total tonnage of vessels passing through it would be 7,250,000; and M. Marteau, editor of the Journal du Havre, takes a more hopeful view and estimates it at 9,000,000, as much during the first year of presumed existence as the Suez Canal had after it had been open fifteen years. I cannot accept these estimates for myself, because these gentlemen take the commerce of Western Europe with the Pacific away from the Suez Canal in the short space of twenty-four hours and send every ton of it forthwith through the Panama Canal. I cannot accept it, again, because the great markets of the Southern Mediterranean, of Egypt, and of India, which have so much to do with the commerce of Western Europe, are apparently ignored in these estimates, and the great fact forgotten, that as long as the eternal laws of supply and demand exist, there will be a trade, and a large trade, between Western Europe and the Pacific via the Suez Canal, no matter if a dozen canals are cut across Central America. But granting that 9,000,000 tons, the largest of the estimates, would be the traffic during the first year of presumed existence, let us examine the results. It is said that fifteen francs will be the tariff per ton; the revenue then becomes 135,000,000 francs. Deduct probable expenses of administration and repair, and we have a balance left that would remunerate an investment of about \$240,000,000. Already three fourths of this sum, or \$180,000,000 has been spent, and the result is houses for 15,000 workmen and employees, hos pitals, and an excellent plant of machinery, and 30, or say, to-day, 331/3 per cent. of excavations. I have already shown that quarters, hospitals, and machinery cost only one-fifth of this, and that the 33 1/3 per cent. of excavation has cost in the neighborhood of \$125,000,000. To increase the excavation more machinery must be bought, to lodge additional workmen other barracks must be built, and today there remains fully 663/3 per cent. of material to be excavated. The inference is that for \$240,000,000 the canal cannot be built. Knowing the remaining cube, cost of excavation, and price of labor, with resources at hand, it is a simple matter of mathematical computation to show that the final cost of the canal will not fall short of \$375,000,000. Such an estimate is too detailed for the purposes of a lecture; but to confirm this estimate probably even more forcibly than our mathematical computations would, the canal company itself acknowledges now that the ultimate cost will be 2,000,000,000 francs in cash, which is even more than \$375,000,000 in gold.

In the original Act of Concession on the part of the Colombian Government to the Inter-Oceanic Canal Company it was agreed that the company should have the right to a border of 200m, of land on each side of the canal and to 500,000 hectares, or 1,235,571 acres, of public lands in such part of Colombia as the company should choose, and the titles to such lands were to be surrendered as the work on the canal progressed. The first surrender was of 150,000 hectares at a time when the Colombian Government conceded that one-third of the total work was finished. This land is situated partly near the Chiriqui Lagoon and partly on the Pacific slope along the Tuira River. Besides this the company has acquired 34,653 acres between Colon and Panama. On the 3cth of last December the first grant was increased to 250,000 hectares, the Colombian Government conceding that one-half of the total work necessary for the construction of the canal had been done; so that the company now owns 652,438 acres of land in Colombia, besides a border of 200m. width on each side of the canal. This concession, however, does not mean that the Colombian Government concedes that one-half of the total cube has been extracted, nor that the canal company made any such claim; but that the present excavation plus the installation-which means the present quarters for

^{*} It has been suggested that the quickest and cheapest way to excavate the earth on the high levels would be to wash it down by powerful streams of water under high pressure into the lower portions of the work where the dredgers could conveniently dispose of it

officials and workmen, the hospitals, and the plant of machinery-represents one-half of the total work to be done in order to finish the canal.

Undoubtedly the plant of machinery and the quarters for employees are important factors of the total work required to construct the canal, but few will acknowledge that in an enterprise of this magnitude they represent 20 per cent. of it, and, to my mind, the Colombian Government would be sufficiently liberal in conceding to-day that one-third of the total work has been done.

As regards time of completion, it goes without saying that the rate of excavation must be small in a work of such magnitude until the plant is complete. It is equally true that more work can be done in a given time with a complete installation than with one that is incomplete. Hence it is false reasoning to suppose that if 32,000,000m8, are excavated in five years it will require nearly twelve years to cut out the remaining 73,000,000. That such reasoning is absurd is shown by the excavations of 1886 alone, which were nearly 12,000,000 of cubic metres, at which rate it would require about 61/2 years to complete the excavations. M. Cha:les de Lesseps told me that in two years the canal would be finished from Colon to k.44. and from La Boca to Paraiso, but that, as to the Culebra, he would leave me to form my own conclusions. The rate of this year does not exceed very sensibly that of last year, and it is hardly practicable to suppose the machinery will be increased so rapidly as to show a marked increase in excavation for a year or more yet. Considering the work necessary even after all the excavations are made, and especially that the two great problems, the Chagres and the Culebra, have vet to be solved, it is a fair estimate to say that even if the work be pushed with vigor the canal will not be open in less than six or seven years.

So far as I was able to verify them the statistics given me by the company's officials were correct. Whatever criticism has been given to the public in condemnation of the hospital service, barracks for workmen, and quarters for officials seem to me not founded on reason and uniust. In such a wretched climate and considering future needs, they are decidedly in the line of wisdom and economy. The machinery should be increased still more, a larger force of excavators and dredges should be at work in the second and fifth divisions especially, and larger cars should be used in place of the small Decauvilles. I see no reason why the excavations should not reach 20,000,000 or 22,000,000 a year.

While on the Isthmus I met many residents and foreigners who were not interested in the canal. Its most bitter opponents were our own countrymen, a few Englishmen, or former employees of the company, or contractors who had been discharged or had some other grievance. Many of these opponents were intelligent men who did not hesitate to make most exaggerated statements, showing either utter ignorance or malice. They did not seem to fear an impeachment of their own intelligence by others, so that in general reliable information was to be obtained nowhere except on the line of works; but from all sides, friendly or otherwise, arose the same admissions that the canal presents no insuperable obstacles, that the company has both brains and energy, and that the final completion is merely a question of time and money.

Note.-Between March and September, 1887, the amount excavated was 5.556,000m3. Returns since then are not at hand, but it is fair to presume that the cube extracted since last March will approximate 10,000,000m8, so that the total cube extracted to date is about 42,000,000m2. Senor Armero, agent of the Colombian Government in a report dated September 1, 1887, states that the total excavation will amount to about 168,000,000m8., an estimate exceeding that of the company by 63,000,000m³. It is true that many will refuse to accept the company's figures as correct. But if its estimate be too small, Senor Armero's is equally too large, and personally I incline rather to the belief that the approximate mean of these two estimates, or about 125,000,000m8., will prove to be the real cube. Senor Armero estimates the whole sum yet required as 3,012,495.400 francs, or \$602,639,080. This fabulous sum he believes will be raised, because so many m llions are already sunk in the work, and one-half million holders of stocks and bonds are interested, and the honor of France is at stake. But at the rate of progress so far attained the work cannot be completed, nor can even the temporary canal, with locks, etc. (now proposed by M. de Lesseps), be opened to traffic in 1889 or in 1892, the year in which the concession terminates. M. de Lesseps

now proposes to excavate the 60k. of lowland to the present dimensions and to form of the 14k. of the highest land a reach or lake connecting with the lower reaches on Atlantic and Pacific sides by locks. Dredges will continue the excavation of the reach, and thus the excavation to a sea-level canal will continue along with the passage of traffic and its consequent financial gains.

TRANSMISSION OF POWER BETWEEN BODIES MOVING AT DIFFERENT VELOCITIES.

A FEW months ago, there was exhibited, in the society's reading-room, a working model of an application to rail-way working of what the inventor calls "division of the mass." In causing a body, moving at a high velocity, to mass." In causing a body, moving at a high velocity, to communicate motion to another at rest, or moving at a lower velocity, he splits one of them up into parts all the more numerous, and therefore tenuous, as the difference in velocity is greater; and this is accomplished by causing one of the parts to take the form of a brush composed of metal fibres.

In applying this principle to the transmission of motion for driving machinery, a disk, fitted with segmental brushes, is slid laterally along the shaft, so that the fibres come into contact with radial projections on a second disk; and, although the contact is made instantaneously, the action is exerted gradually, owing to the flexibility of the fibres. That is to say, the full power is communicated without

A similar arrangement, but with one of the disks fixed, serves as a brake for arresting motion, and this again without shock but with gradually increasing action. Where space is very much circumscribed, the clutch and the brake may be combined, by fitting a disk with brushes on one side, and projections on the other, so that it may be brought by a lever against a second disk for transmitting motion, and against a third, fixed, for stopping it. Safety appliances for arresting the descent of mine cages, in the event of the rope breaking, have hitherto depended upon the entrance of claws into the guides, or the clipping of the latter, or the wedging of the cage between the guides. A similar arrangement, but with one of the disks fixed

between the guides.

In this application of the system, the guides of the shaft are fitted with corrugated-iron plates, and the sides of the cage with steel brushes. In the normal state of working, the brushes are kept clear of the guides, but, should the rope break a small brush, fitted on a sector, constantly rubbing against the corrugations of the guides, aided by a spring or counterweight, brings the main brushes into contact with the guides by a link arrangement, like that of the parallel ruler, thus arresting the cage, and holding it suspended until the brushes are gradually relaxed, for "braking" the cage slowly down to the next landing.

"braking" the cage slowly down to the next landing. Many attempts have been made to cause a locomotive, running at full speed, to exert such a mechanical action as would set a signal to danger, so as to protect the train from another following in the rear. By fitting the engine with a steel brush, attached to the axle-boxes, so as to preserve a uniform height with respect to the rails, a stationary lever may be gradually moved, so that the signal is set at "danger" without shock. Moreover, by means of another brush in the event of the engine being turned of another brush, in the event of the engine being turned upon the wrong line, a lever may be made to shut off the steam, apply the brakes, blow the whistle, or move an index on a dial, recording a neglect of duty, or may exert these four actions simultaneously.

All the above applications of this principle—"the division of the mass" have been tested experimentally, the last-named by the model above referred to. The clutch arrangement has transmitted six horse-power from a petroleum motor, making 200 revolutions a minute, to a de making 2,000 revolutions, while applications to industrial purposes are now being made, both in this country and in Belgium. The inventor of the system is M. Raymond Snyers, Ingenieur des Mines, du Genie Civil, et des Arts et Manufactures, of the Louvain University - Journal of the Society of Arts.

THE GREAT BEAR VALLEY DAM.

Los Angeles, Cal., December 17, 1887.—One of the disadvantages which tend to obstruct the advancement of many sections of Southern California which have been boomed by land agents and speculators is the lack of water, for without means of irrigation there is no chance tor development. A few days ago I went over to Redlands to take a trip over the mountains on the back of a bucking Mexican broncho to inspect the remarkable bit of engineering work recently completed in the Bear Valley, by which the towns of Redlands and Lugonia receive an unlimited and exhaustless supply of water the year required. unlimited and exhaustless supply of water the year round. The ride is about thirty-two miles over the mountain trail. Leaving the small settlement of Crafton we wind through the Mill Creek Canon, and then climb over the San Bernardino Mountain at an elevation of 5,600 feet above the sea, or 4,100 feet above Redlands. Then we go down and through the Santa Anna Valley and cross the next ridge at an elevation of 7,600 feet. Then we descend 1,200 feet and ride three miles further, when we come to the great Bear Valley Dam, which backs up the Bear Valley Lake, or great reservoir, as it may now be called. One is spellbound when he examines this stupendous piece of work and realizes the labor that it cost. All of the cement and other materials, excepting the granite, which was quarried near by, was carried by teams and pack-mules 100 miles, and each barrel of cement cost \$13 when delivered at the dam. It took a team two weeks to reach the Colton Railroad station, and the engineers and laborers Colton Railroad station, and the engineers and laborers lived in rudely-constructed log huts for six months. From Colton the route was up the Cajou Pass, thence over the Mojave Desert, then through "Lucky" Baldwin's silver mine trail to the end of the dam. The dam is built of big blocks of granite, ranging from a half ton to ten tons in weight, the majority being about four tons weight each. Its base rests upon a solid rock foundation and its present height is about sixty feet, though it may be increased twenty feet without any risk of weakness. It is a curved dam, its length of arc being 300 feet and its radius 345 feet. Its base is twenty feet wide, and from this it slopes to three feet wide at the top. Its average coefficient of safety is twenty-five, and it would stand twenty times ol safety is twenty-five, and it would stand twenty times its present pressure. The engineer was F. E. Brown, a graduate of Yale College and of Yale Scientific School, and one of the largest property owners in the county. The State Engineer of California has pronounced the work not

only efficient, but a remarkable piece of engineering.

The lake or reservoir receives the drainage of 200 square The lake or reservoir receives the drainage of 200 square miles. It covers an area of 4,000 acres, three-fourths of which around the old lake was used as a sheep ranch until purchased by the Bear Valley Company. At the present height of water, fifty-three feet, at the dam there is a supply of nearly 10,000,000,000 gallons, covering an area five miles in length and a half mile in width an average depth of fifteen feet. With the dam at its full contemplated height the lake will hold 40,000,000,000 gallons, and at sixty-five feet 21,000,000,000 gallons. Before the dam was ball this water was allowed to flow in winter torrents to the sea. It is now capable of irrigating 50,000 acres of land in the frostless foothills, once supposed to be beyond the pale of irrigation, and to supply a posed to be beyond the pale of irrigation, and to supply a population of 500.000 for domestic purposes. It at present irrigates the lands included in the towns of Redlands, Lugonia, Craston, and Highlands, and is to be extended to San Bernardino.—Correspondence of N. Y. Tribune.

A THOUSAND HORSE-POWER WATER-WHEEL.

A TURBINE of 1,000 horse power, described in the Chronique Industrielle, December 11, has just been placed in the Terni Steel-Works at Rieter & Co.'s shops at Winterthur, France.

The motor utilizes 560 litres per second of water under

The motor utilizes 500 litres per second of water under a head of 180 m.; the coefficient of efficiency is 0.75.

The turbine is of Schoamburg's design, specially designed for great heads and limited supply. Its internal diameter is 2.8 m; it weighs 4,500 kilos, and makes from 180 to 240 revolutions per minute.

HOT-WATER HEATING IN THE RESIDENCE OF F. WYLD, ESQ., OF TORONTO, CAN.

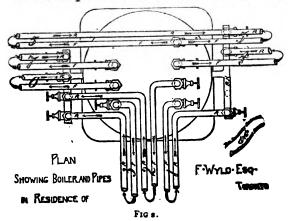

THE accompanying description and illustrations of the heating by hot water of the residence of F. Wyld, Esq., of Toronto, Can., must prove of interest to hot-water engineers and others interested in the warming of houses.

Many residences in Canada are warmed by hot water, and a practice very much in vogue, if not the only one now resorted to, is to run separate circuits of main pipes from the top of the boiler to the principal divisions of the house. This practice seems to have its advantage in the fact that the fitter is much more likely to have nearly uniform results at all parts of the house in the matter of equitable temperatures of the water in the radiators or the coils than he would if he were to run a large main and branch from it to the sections or rising lines.

Really, this separate circuit system is unnecessary if the work is planned by one who has time and ability to consider carefully the conditions and requirements of the different lines and branches of a system, or if one wishes to use a main so very large that there is no question of its ability to carry water hot enough to the remotest end no matter how slow its current may be; but this carries the fitter to the other extreme, and probably will increase the cost -at least for small buildings or residences where a boiler can be placed somewhat central-beyond what separate circuits of 2-inch pipes or thereabouts will come to.

Currents through a branched system unquestionably take the direction of least resistance and will short-circuit

unless planned by an expert; whereas, the separate circuit must circulate to the end, if it circulates at all, and hence the practical man finds it to his advantage to use it.

In this house, as seen by Figs. 1 and 2, the separate system is carried out almost to the extreme. They are all of 2-inch pipe, except where they branch to two heaters, and the return-pipes are the same diameter, as they properly should be, as the shrinkage of volume of the water is so inconsiderable between the flow and the return that no attention should be paid to it.

The circuits are numbered from 1 to 7 inclusive, and may be traced on the plans of basement (Fig. 3), like numbers corresponding to like circuits in all illustrations. Number 1, to the right of Figs. 1 and 2, supplies the lower hall (box) coils of 1-inch pipe of 432 and 330 lineal feet respectively, and the coil in pantry of 96 feet, lineal, of 1-inch pipe. No. 2 supplies the parlor and pantry on the main floor, and then runs to the bath-room on the second floor, and a branch from it goes to the expansion-tank. No. 3

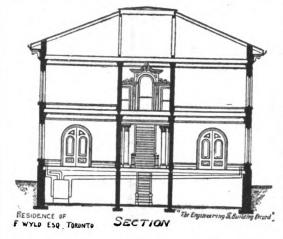

FIG. 4.

goes to the two heaters in the drawing-room, one of 324 feet, lineal, and the other of 288 feet. No. 4 supplies the two library coils of 200 feet, lineal, each; No. 5 the two dining-room coils of 336 feet, lineal, each; No. 6 the indirect coil under main hall of 600 feet of 1-inch pipe; and No. 7 the front hall coil second story, and the coil in the front chamber next to it.

The remaining rooms of the house have no heaters in them, but the owner informed the writer that even in the climate of Toronto they are warm enough to be comfortable at all times when the doors were open, the fire-places drawing the warm air of the halls into them.

The connections to the coils are large-11/2-inch for large coils, 114-inch for medium, and 1-inch for the small one in pantry.

The circuits are treated very much in the way plumbers in New York treat the circuits for domestic supply in their best work. The flow and the return pipes are supplied with valves close to the boiler, as plainly shown in Figs. I and 2. A line of small "draw-out" pipes are placed in the flow and return pipes on the house-side of the stopvalves to allow of the drawing off of the water from a line or circuit. This is plainly shown in Fig. 1, and also the funnel into which they empty. This funnel is trapped in the usual manner to the sewer and the overflow-pipe of the tank is brought into it to prevent a dry trap.

The letter F, for flow, is on the outgoing pipes of the circuit and R on the return-pipes. Arrows also show the direction of the flow of the water in both pipes, so that a little study of the diagram will readily show the relations of one to the other.

The pitch and flow of the pipe is always upward until it reaches the heater, so as to free itself of air at the highest pipe of the coil (the upper header), at which point an air. vent is used. The box-coils are screened and have marble

The total surface in square feet, not including the mains, is a little over 1,500, and the boiler is a No. 36 Gurney, of about 51 square feet of surface of all kindsthat is, fire-box and flue surface-which gives a ratio of boiler surface to radiator surface of I to 20.8

The dotted lines on basement plan show the old furnace and furnace pipes. With this arrangement 32 tons of coal used to be burned in a winter without sufficient heat. The consumption of coal with the hot-water apparatus is 19 tons.

The apparatus was put in by Messrs. Cruickshank Brothers, of Toronto, and the architects of the building were Messrs. Smith & Gemmell also of Toronto.

CINCINNATI MASTER PLUMBERS' ASSOCIA-TION.

THE annual meeting of the Master Plumbers' Association was held Monday afternoon, January 16, at Lancet Hall, President Carlisle in the chair, and a full attendance on the part of members.

The following officers were elected to serve during the ensuing year :

President, Richard Murphy, of Murphy & Atkinson. First Vice-President, Thomas McNeil, of T. & J.

Second Vice-President, Frederick Lamping, of Fred-

Second vice-fresheld, Frederick Framping, of Frederick Lamping & Sons.

Treasurer, James A. Gibson.

Secretary, N. K. Aylward.

Sergeant-at-Arms, Stephen Noland, of Noland Bros.

After the election of officers, the afternoon was taken up in passing on the proposed amendments to the plumbing laws, which are to be taken to Columbus, January 19.

THE Chicago Master Plumbers' Association, under the new President, Andrew Young, announces several lectures the coming year before the association, the lecturers including Health Commissioner Oscar C. De Wolf and De Witt C. Cregier.

THE Chicago Builders' and Traders' Exchange will be officered this year as follows: President, George Tapper; Vice-Presidents, Francisco Blair and M. Madden; Treasurer, Joseph Downey; Secretary, J. A. Pettigrew; Directors, F. S. Wright, W. H. lliff, E. A. Thomas, E. A. Wells, Thomas Moulding. The membership is 511.

PLUGS USED IN TESTING SOIL-PIPES.

LONDON, December 30, 1887.

SIR: I notice this inquiry and beg to remind you that I sent an illustration of one invented by Mr. Charles Hawkesley, M. Inst. C. E., and which was shown at the International Health Exhibition held in London in 1884. But on referring to my bound volumes of your journal I fail to find it or that you made use of it. I now send another pen-and-ink sketch of it (see Fig. 1). It consists of two hard-wood blocks turned in a lathe, a little smaller than the pipes to be tested. An India-rubber ring is placed as shown. On screwing the blocks tightly together, the

ring bulges outwards and presses closely against the inside of the pipe. The screw consists of a piece of iron barrel, with screwed ends and fly-nuts. A cap should be screwed on at A when water pressure is being applied. An air-pump or a pressure-gauge can be attached if the pipes are being tested pneumatically. Figure 2 is a sketch, half in section, of the plugs used by the writer. They are made of malleable cast iron, with a screwed bolt cast on the bottom plate, and a brass bow headed nut and India rubber ring, as shown. In your journal, Vol. II., page 133, is an illustration showing a section of a manhole cover. Several London engineers use stoppers made as there shown, and they answer admirably when made to suitable sizes for plugging drains. Yours truly,

HOW PLUMBERS MAKE LEAD BENDS. NEW YORK, January 25, 1888.

J. W. C.

SIR: In your issue of January 7 I had the pleasure of reading an article on "pipe bending," from a Western correspondent, and the want of sufficient time only has prevented me until this late day from taking a few exceptions from the gentleman's assertions and making a few remarks from a different standpoint.

Keeping in mind the ancient adage that "what may cure one will kill another," and appreciating fully that many miles intervening, it is possible that my suggestions may seem to my fellow-workman as unreasonable and useless when applied to his management and methods, as his suggestions seem to me, yet 1 ask permission to assume the negative and explain the manner in which a New York plumber would make bends in a lead pipe.

The method he proposes is not original with him; neither is the method which I will speak of original with me, as it has been pretty generally adopted here for some time past.

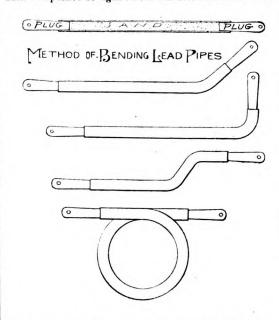

The rounded block has been in more or less use here for some years in bending metal pipes, more especially brass and copper pipes, which have recently been used for exposed and ornamental plumbing-work to considerable extent, but latterly the block has been discarded for different and better methods.

If your correspondent is interested in lead bends made with sand, let him procure from a "wood-turner" eight tapered maple plugs, or of any wood of similar close-fibred nature, and he has then fully equipped himself to make bends in 1 inch, 11/4 inch, 11/2-inch, and 2-inch lead pipe. The plugs should be about 12 or 14 inches long each, and those for bending 1-inch pipe to be 78-inch at one end, tapered up to 11/8-inch, and at the large end a 1/2-inch hole should be bored at right angles with the length of plug and entirely through the same about 21/2 inches from large end. The plugs for bending 11/4-inch pipe should be 11/8 at small end, tapered up to 13% and made in same manner; those for 11/2-inch pipe tapered from 13/8 to 15/8, and those for 2-inch pipe from 1 7/8 to 2 1/8 inch.

Now to make a bend in a 2-inch pipe dry white sand is the best, and, after driving one of the 2-inch plugs into

one end of the pipe, which should go in about three inches if the plugs are tapered right, fill the pipe with sand and stand it up in a vertical position with the plugged end down.

Now tap the pipe gently, commencing at the bottom, with a soft-pine dresser, and work slowly up to the top of the pipe, continually tapping gently to settle the sand until it is packed so tight that it will settle no more. Now

fill up the pipe again and repeat the action, leaving about three inches unoccupied for the admission of the other plug. Now, holding the pipe an inch or so clear of the floor, drive in the other plug until it strikes the sand, which you will know by the plug expanding the pipe.

Now we have a solid body of sand encased by lead pipe and held firmly in position by the two plugs. Care must be exercised while bending to keep the plugs driven home at all times, or otherwise the bend will "kink" at the throat when bending is commenced.

Next heat the pipe at point desired to bend by burning paper under it or holding it over charcoal fire. When it is hot enough to hiss when spat upon it is ready to bend.

Now, place it flat on the floor or bench, and with the left hand place a felt or cloth over the heated portion and grasp the pipe firmly to hold it in position, while with the right hand grasp the plug near the end of the pipe and raise it, forming an angle of about 45° at the first time. Now stand the pipe up as at first and dress it down to pack the sand as before, as the bending has spread the sand and loosened it. After dressing down, drive the plug home again and repeat the bending process once or twice, or more if necessary, to produce desired angle.

After bending in this manner, I think your correspondent will light his fire with the bench-blocks.

I have spent more time in explanation, in order, if possible, to be plain, than it would take to do the job.

I neglected to say that the holes in the end of the plugs are to place a bending-iron in to drive them out of the Yours, etc.,

OFFICIAL INSPECTION OF PIPING FOR NATURAL GAS AT INDIANAPOLIS.

THE Builders' Exchange of Indianapolis are rendering that community a real service when they are urging on the Common Council of that city the adoption of an ordinance looking to the protection of the lives and property of citizens by securing the inspection of the work connected with the introduction of natural gas. We do not know whether Indianapolis has a plumbing law or not, but, as much as that is needed, it is more important that some control should be had over the class of men that will undertake to do the work connected with the introduction of natural gas, since, as has been stated, whenever there is any unusual amount of work in a community, that fact attracts to it incompetent and irresponsible men from other localities, who go there to make what they can by scamping work, defrauding creditors, and then leaving the town for a new locality where there is a sudden demand for the services of mechanics. The resolutions of the Exchange, which we quote from the Indianapolis News, are as follows:

"Whereas. The introduction of natural gas into Indianapolis will necessitate the immediate plumbing of the

houses for its use; and whereas, the experience of other cities has shown that natural gas is a dangerous element, and requires the best character of pipe and plumbing-work to be done to avoid accidents; and whereas, the large and unusual demand of the public for its introduction will induce incompetent and inexperienced persons to attempt the work, and thus imperil life and property; therefore, be it

"Resolved, That we are in favor of the appointment at once by the City Council of a competent man to act as inspector, who shall be required to examine and test all pipes, fixtures, and connections in a house before natural gas shall be turned into said house; that said inspector shall issue his certificate, stating that he finds the work is sufficient and safe, or, if in his judgment such work is insufficient and unsafe, he shall so certify, and shall spe-

sufficient and safe, or, if in his judgment such work is insufficient and unsafe, he shall so certify, and shall specifically set forth wherein the work or material in question is insufficient or unsafe, and said inspector shall leave such notice with the owner or occupant of the house and a copy thereof with the president or superintendent of the gas company proposing to furnish gas to said house, and to prevent arbitrary or interested action on the part of such inspector he should be required to give a bond holding him liable to any person who may be injured by his action should he without cause, or from corrupt and interested motives, falsely certify to the condition of said plumbing. "Kesolved. That with the same purpose in view to protect life and property against unsafe or insufficient naturalgas plumbing, all persons desirous of doing such work in the city of Indianapolis shall, before undertaking any job of natural-gas plumbing, file with the City Clerk his application, with a sworn statement of the experience he has had in natural gas or other plumbing and the certificate of a resident architect that in the opinion of such architect said applicant is competent to do natural-gas plumbing, and said applicant shall at the same time file with the City Clerk his bond in the sum of not less than \$2,000, helding said plumber liable to the person injured for any and all damages which may arise from any accident occurring by reason of any ascertainable defect in the material or negligence in the work performed in making any fitting or connection on the pipes or fixtures put in by him for the conveying of natural gas.

"Be it further resolved." That the Chair be requested to veying of natural gas.

"Be it further resolved, That the Chair be requested to appoint a committee of five from the Builders' Exchange to convey to the City Council this resolution, and to assist in any effort that may be made in carrying out the objects

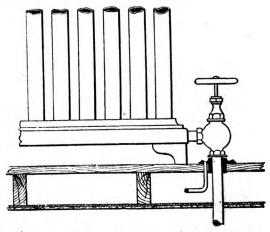

J. C. Adams, George Weaver, Conrad Bender, William Terrell, and M. S. Huey were appointed a committee in accordance with the terms of the resolutions.

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

SAFETY-PLATE FOR STEAM-RADIATORS.

EDWARD W. MARSH, of Hartford, Conn., has patented a novel floor-plate for radiators in connection with an angle or radiator valve. The plate is somewhat of the usual form, but with a channel for water in its upper face.

SAFETY PLATE FOR STEAMPIPES

From this channel a small drip-pipe is run to any suitable place to carry off any leakage. A projecting rim at the lower end of the valve is of just sufficient width to shed the drops into the channel as they run from the stem or stuffing-box.

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

A GARBAGE CREMATOR AT MILWAUKEE.

MILWAUKEE, WIS., January 18, 1888.

SIR: Replying to the query on page 108, I will state that we have a garbage-cremating furnace in this city. It is owned by William Forrestal, who was the builder of it. He is paid the sum of \$10,000 per annum by the city for consuming the garbage, and it has worked satisfactorily so far. William Forrestal's address is 1513 Cedar Street. W. G. NICHOLSON.

PLAN FOR VENTILATING MONTREAL SEWERS WANTED.

HEALTH DEPARTMENT, CITY HALL, MONTREAL, January 7, 1888.

SIR: A committee appointed by our Board of Health is now inquiring into the best means of ventilating public sewers, and they are desirous of obtaining the views of the most competent authorities on the subject. So, having been instructed to invite your opinion, I would request you, should it not be an inconvenience, to impart to us your views as to what method it would be best for us to adopt to ventilate our sewers, whether through the manholes, the gullies, or through the private drains and soil-pipes, taking into consideration our climate. As you soil-pipes, taking into consideration our climate. As you are aware, our streets, in the winter time, are often covered with snow and ice to the depth of several feet, a difficulty not met with in warmer latitudes.

An early reply will be looked upon as a great favor.

Yours truly, J. IGNATIOS FLYNN,

Secretary Board of Health.

[See editorial elsewhere.-ED.]

REMOVING WATER CONDENSED ON INSIDE OF WINDOWS.

DETROIT, January 20, 1888.

SIR: Please inform me in the next issue of your highly-appreciated paper the best method of disposing of water caused by the melting of ice and condensation on the inside of windows. I have recently completed a church which is heated by steam. I am much troubled with the water from the windows. I have made openings at bottom of window frames to convey the water outside the building, but they freeze up and are not effectual.

ALBERT E. FRENCH. Yours truly,

[The excessive moisture complained of is possibly due to the newness of the building, which not being continuously heated, the plastering, etc., dries slowly.

Perhaps the best thing that can be done is to run a Emall drip-pipe inside from each window down into the cellar, where, as the quantity from each window would be

small and the intervals between discharges long, there would be no objection to its discharge on the cellar floor. The use of outside sashes in winter would relieve and perhaps remove the difficulty and might save enough fuel to make them not very expensive in the long run. A radiator under each window would have a similar effect. Before doing anything else, however, it would be well to see if the cause cannot be removed, which, in the case of such excessive condensation, we should be inclined to think might be in some small steam-leaks in the heating-apparatus which charge the air with moisture. Small steamleaks, not otherwise perceptible, are sometimes detected by the dew on an adjoining window. It is very difficult to find a small steam-leak in a warm room, but perhaps by opening all the doors and windows while steam was on, some might become visible. A still more certain way would be to fill the heating-apparatus with water and apply pressure. At least, it would pay to see that all air-valves and stuffing-boxes were thoroughly tight. If condensation occurs in the daytime when the church is empty it can safely be laid to steam-leaks, unless indirect radiation is used with a water-pan to moisten the air which may be too efficient.

In the evening, in ill-ventilated rooms, the water from the combustion of the gas will add much to the moisture of the air. This can be readily shown by holding over a gasjet a cold spoon on which dew will quickly form and as quickly disappear when the spoon gets hot.]

SUGGESTIONS FOR THE "L" ROADS.

NEW YORK, January 7, 1888.

SIR: Travel on the elevated roads becomes daily more tedious and uncomfortable, to say nothing of the carelessness and danger exemplified in the many recent blockades and accidents, two this week on Third Avenue within 15 hours and at the busiest times.

Probably we will have to endure all until the maximum discomfort forces investments in substantial competing lines or a hitherto miraculously delayed slaughter causes suitable precautions for safety to be enforced. Meantime, one or two especially obvious measures would relieve the pressure, save time, and increase the possible traffic.

First—Let the platforms of all the principal stations be extended 50 to 100 per cent; correspondingly augment the

extended 50 to 100 per cent.; correspondingly augment the number of cars in each train and draw it by two engines,

one front and one rear, or both front, and separated as far as may be requisite for capacity of structure.

Second—Let all trains be classified under, say, four heads, A. B, C, and D, each class following successively the other

Let the stations be numbered consecutively from one end, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, etc. Train A steps at I and 2, 5 and 6, 9 and 10, etc., skipping 3 and 4, 7 and 8, 11 and 12, etc.; Train B stops at 1, 2, and 3, 6 and 7, 10 and 11, etc., skipping 4 and 5, 8 and 9, 12 and 13, etc.; Train C stops at 1, 3, and 4, 7 and 8, 11 and 12, etc., skipping 2, 5, and 6, 9 and 10, etc.; Train D stops

at 1, 4, and 5, 8 and 9, 12 and 13, etc., skipping 2 and 3, 6 and 7, 10 and 11. Next Train A stops at 1 and 2, etc., as first one did.

Thus no passenger at any station would have to wait more than three trains for one stopping at any given point, and only half the number of stops would be made by the

Either of these arrangements would be practical, and if this suggestion does no other good it may elicit further attention to the subject.

SUFFERER.

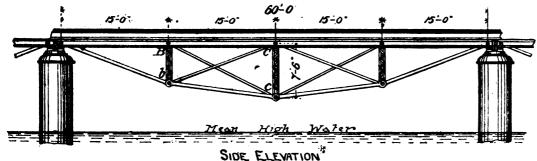

[Our correspondent's suggestions are certainly ingenious, and we share his hope that they may elicit some profitable discussion. We think, however, that it would be difficult to get two engines to work together without straining or slipping as promptly as elevated road work requires, especially if separated by the length of a train, which should be under the instant and absolute control of

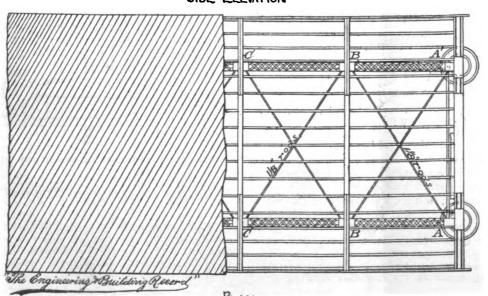

In regard to his second suggestion, it will be noted that as long as all trains stop at the same stations the distance between consecutive trains will not vary greatly, and the headway or time between trains may be reduced to a minimum, but if they stop at alternate stations they will be continually gaining or losing ground with reference to each other, so that safety will require the headway to be increased and fewer trains can be run per hour, which would largely offset the increased speed due to stopping at fewer stations, and what with the delay of waiting for the right train and the danger of getting in the wrong one, we think the plan would be "more plague than profit."]

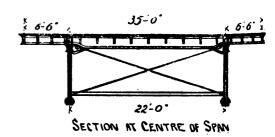

IRON PIER AT MARINE PARK, BOSTON.

THIS pier is being constructed by the Builders' Iron Foundry, Providence, R. I., from designs and specifications prepared under the direction of City Engineer William Jackson, and consists of twelve wrought-iron deck spans resting on cylindrical cast-iron piers, which are set radially on a curve of 2,500 feet radius to the centre of the structure. The lower sections of the piers are about eight seet long each, and the flange-joints are made water-tight with red lead and packing. The piers are sunk till they extend at least eight feet into hard bottom, all earth and other material being removed from inside them as the sinking progresses, and the cylinders filled with concrete made from the best Portland cement. The bottom underneath the piers is of a hard, tough clay. and the material above it is such as to prevent water entering the cylinders while being sunk.

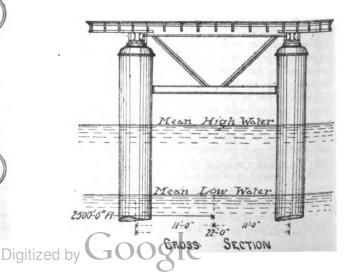

The average rise of the tide is 10 feet, and the flooring is 241/2 feet above mean low water. The longitudinal trusses are supported on castings which are bedded in the concrete filling of the pier. They have expansion con nections allowing for longitudinal movement at their free ends upon faced transverse bearing strips.

TRON PIER AT MARINE PARK · BOSTON·MASS·

The transverse girders connecting the piers in pairs are entirely independent of the adjacent spans, and are supported on vertical struts that pass through slots in the caps of the piers, and extend nearly five feet below them, where they terminate with horizontal bottom angles that are firmly bedded in the concrete filling, which is carefully brought to the required level, and, after these supports are bedded, the remaining space in the piers is filled with concrete and cement-mortar thoroughly rammed around the supports.

This arrangement, while it relieves the shell of the piers from all load and requires it merely to protect and confine the enclosed concrete, also provides against small inaccuracies in grade and position of piers when placed, as any such irregularities can be readily overcome when bedding the supports in the concrete.

This as well as other details are clearly shown in the accompanying illustrations.

ENGINEERS' CLUB OF PHILADELPHIA.

THE tenth annual meeting of the club was held January 14, 1888, President Thomas M. Cleemann in the chair; Howard Murphy, Secretary and Treasurer; 44 members and I visitor present.

The retiring President, Mr. Thomas M. Cleemann, read the annual address.

Mr. Cleemann urged upon the members the necessity of keeping up the club with the ablest of the young engineers, and reminded them that many of the greatest inventions and discoveries relating to engineering originated in Philadelphia and its vicinity. The first successful steamboat, the first locomotive in America, were made by her citizens. The first permanent tramway, the first engineer's transit, the first modern suspension bridge (with a stiffening truss), the first wire suspension bridge, the first arched bridge hinged at the middle and the ends, all originated in Pennsylvania.

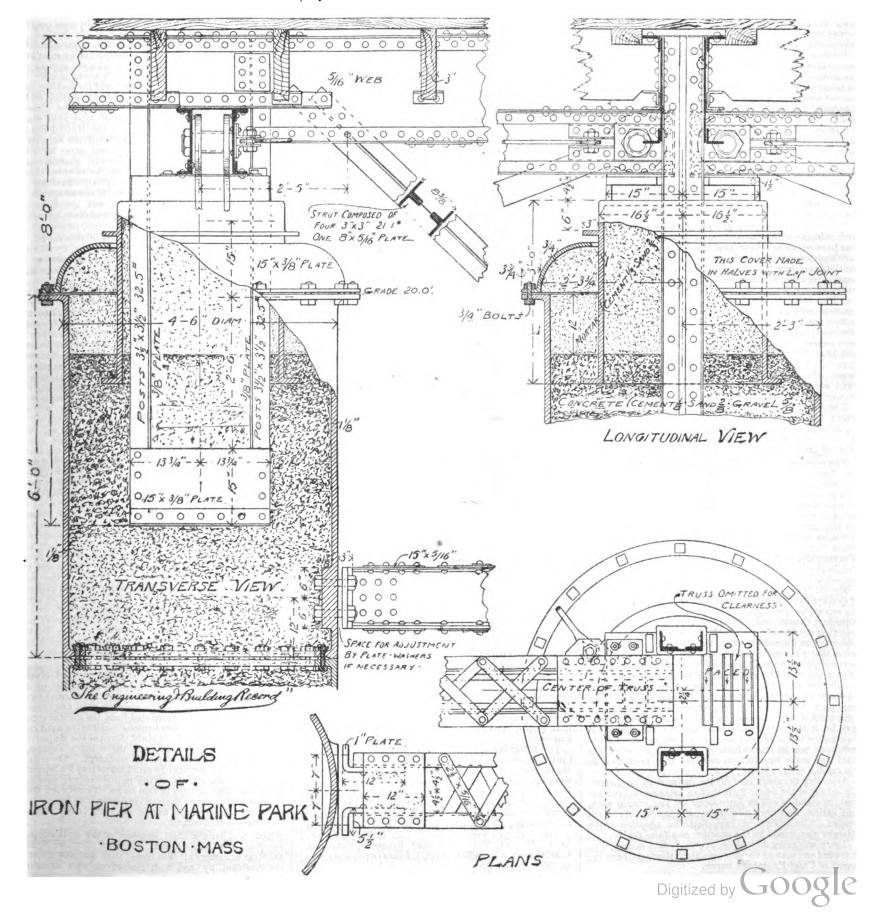

He recommended a more agressive spirit in claiming recognition from the city authorities when they required experts to advise them.

He referred to the Panama Canal, charging a want of good judgment in its location and management, and claiming that the latest advices, showing an abandonment of the projector's favorite scheme of a sea level canal, so often and obstinately insisted on by him, made the Nicaragua route superior.

He also referred to the extraordinary depths of the foundations of the Hawkesbury Bridge, the great spans of the bridge over the Firth of Forth, and the proposed North River bridge at New York, to surpass all others in size.

The following persons were elected active members: Messrs. Louis H. Parke, Barton H. Coffey, Agnew T. Dice, Simon C. Long, Jacques W. Redway, Samuel Bell, Jr., George W. Chance, Charles H. Haupt, George W. Creighton, Jawood Lukens, Alan Wood, Jr., Charles R. Hall, Robert A. Cummings, T. W. Simpson, General W. F. Smith, Charles Lukens, Herbert Bamber, and Barnabas H. Bartol; and as associate members, Messrs. George T. Mills, Michael Clarkson, and A. J. Rudderow.

The officers elected for 1888 are as follows: As Presi-

dent, Joseph M. Wilson, as Vice-President, J. T. Boyd; as Secretary and Treasurer, Howard Murphy: as Directors, T. M. Cleemann, Frederic Graff, Professor L. M. Haupt, Washington Jones, Henry G. Morris.

President elect Joseph M. Wilson, in taking the chair, cold.

said:
"Fellow Members:—I beg to thank you for the compliment vou have paid me in electing me to the position of your Pre-ident, and I trust that I may be able to show my appreciation of the honor and my deep interest in the club, not only by giving my earnest attention to the duties which appertain to the office, but also by using my utmost endeavors to encourage whatever will tend to the club's advancement and prosperity. I am very much afraid, however, that my efforts will suffer by comparison with the e of my worthy predecessor, whose deep, earnest devotion to the welfare and progress of the club and close attention to duties, have gained for him a reputa-

tion that it would be difficult to surpass.

"A club of this kind has a wide field open to it, with "A club of this kind has a wide field open to it, with great capabilities for good work, even greater in some respects than would, perhaps, obtain in a more prominent or more widely spread society, where the restrictions and liabilities are increased. The young life, the liberality as to eligibility, the local interest and acquaintance among the members, and the freedom from the trammels that would encompass an older and more conservative organization, where the establishment of a precedent must always be considered, give greater opportunities and enable matters to be taken up and discussed in a way and enable matters to be taken up and discussed in a way

and enable matters to be taken up and discussed in a way that would hardly obtain elsewhere.

"There are numerous practical subjects of great importance and interest, not only to the engineer, but to the architect, the manufacturer, or the citizen, that might be brought before the club with advantage. Much of this kind of work has already been done, but cannot the usefulness of the club be still further increased in this direction? For instance, there are local questions upon which a gratuitous opinion from among those best qualified to judge might be of great benefit to the public. Papers upon the practical details of such matters as lighting by electricity, electro-motors, storage-batteries the heating electricity, electro-motors, storage-batteries, the heating and ventilating of buildings, sanitation, practical information on the locality and quality of the various woods, stones, and other materials used in construction, and an almost endless variety of subjects might be proposed for

this purpose.

"It would be an excellent thing to prepare a list of such subjects, and to have it posted where all may see it, and from which selections could be made.

"Members might hand in new suggestions from time to time, as they telt the want of information. These papers need not be long—the closer they adhere to the practical part of the subject the better.

"The club numbers among its members very many practical men in all departments of engineering, architecture, and manufacturing, and itsgenerous policy as to admission to its associate class makes it just the place for

such papers. "The club has had a good past, it is in the tide of present success, and before it lies a great future, if it is properly developed and encouraged. My heart and hand are with it. Will you all join me in wishing it prosperity?

The Secretary and Treasurer presented his annual The Secretary and Treasurer presented his annual report for the fiscal year 1887, as follows: Receipts, \$4,332.65; expenditures, \$4,111.36; balance, \$556.48; other assets, \$1,237.20, which does not include the value of the library.

The membership at the end of 1886 was 468; additions, 32; deceased and resigned, 25; at the end of 1887, 475,

32; deceased and resigned, 25; at the end of 1887, 475, of wnom 221, active members, reside in Philadelphia.

A communication was received from Mr. Walter Wood. Chairman of the Finance Committee of the Local Entertainment Committee of the American Society of Mechanical Engineers, transmitting to the club \$206.35, a portion of the unexpended balance in the hands of that committee, which the subscribers desired to present to the club. [Presumably, in acknowledgment of the courtesy of the club in placing their house at the disposal of the committee.—ED]

club in placing their house at the disposal of the committee.—ED]

Mr. A. Marichal read a paper on the "Plan Formation of Quaker Bridge Dam." The topic of his discussion was the report, by the engineers in charge, to the New York Aqueduct Commission, on the "Non-Advisability of Constructing the Dam on a Curve." The author of the paper says: "The formula used by the designers in order to prove that a pressure of 46.8 tons per square foot would be transmitted to the voussoir joints, if the dam would act as an arch, would be good only for an ideal dam, without be transmitted to the voussoir joints, if the dam would act as an arch, would be good only for an ideal dam, without any thickness, without any elasticity, offering no resistance whatever to the water-pressure. As soon as you jump from pure theory into practice, you are compelled to give some thickness to your wall; and no matter how thin it may be, it will offer some resistance to the horizontal thrust of water, and only the excess, not carried by the wall itself, will be transmitted to the abutment, which will react and make acquilibrium provided the reactions. react and make equilibrium, provided this reaction does not reach a certain limit."

not reach a certain limit."

Assuming the limit fixed by the designer to be correct, the author of the paper finds that an increase of 100 per cent. of stability will be introduced by the curved plan, and claims that this additional stability is very much needed. Concluding, he says that the adoption of the straight plan would be the sanction of a false theory.

There was some discussion by Mr. J. E. Codman, who defended the plan of the dam quoting abstracts from the

defended the plan of the dam, quoting abstracts from the report of Chief Engineer Church.

Mr. H. S. Pritchard presented an illustrated description of a graphical method of determining the deflection of bridges. An open draw-bridge is chosen for illustration. The usual formula for calculating the variations in the length of each member, due to the strain, is given. Then, means of diagrams, a graphic method of obtaining the deflections from these variations in length is explained, its application to the draw bridge shown, and suggestions given for its use in other forms of bridges.

THE OHIO SOCIETY OF SURVEYORS AND CIVIL ENGINEERS.

This society held its ninth annual meeting at Columbus. O, January 10, 11, and 12. The attendance was larger than at any previous meeting. Among those present were: M. E. Rawson, of Cleveland; W. H. lennings, of Columbus; John L. Culley, of Cleveland; Benjamin Thompson, of Urbana; A. G. Pugh, of Columbus; J. S. Humphrey, of Garden City, Kan.; E. D. Shreve, of Mansheld; Frank M. Kennedy, of Washington C. H.; Homer C. White, of Warren.

On the first day the following papers were read: on "The Judicial Functions of the Surveyor," by Homer White, of Warren; a paper on "Adverse Possession," by E. D. Haselton, of Mahoning County; on "Steel Tapes as Standards," by Prof. J. B. Johnson, of Washington University, Mo.; an address by George R. Gyger, of Alliance, on "Protection from Incompetency," and a historical sketch of "Our Public Domain," by J. T. Bruck, of Cardington. THIS society held its ninth annual meeting at Colum-

of Cardington.

The evening exercises were opened by the address of President W. H. lennings. Dr. Edward Orton. of Ohio State University, gave a lecture on "Road-making Materials of the State." Professor Orton was followed by Mr. C. A. Hanlon, of Massillon, O., who presented a paper entitled "A State Topographical Survey." The evening closed with a report of the Committee on Civil Engineer-

The afternoon of the second day was largely spent in discussing the material used in paving of streets and making of roads. A free exchange of opinion as to the merits of certain paving stones was made and considerable attention paid the manner of laying them.

A committee from the Centennial Commission, who waited upon the society for the purpose of having a display A committee from the Centennial Commission, who waited upon the society for the purpose of having a display of relics of the profession 100 years ago, at the coming centennial, was informed that their request would be complied with so far as was possible. The following papers were read during the day: By Jonathan Arnett of London, Madison County, on "Philosophy of Underdrainage;" by Frank Kennedy, of Washington C. H., on "The Catfish System of Drainage;" by G. S. Innis, of Columbus, on "Construction of Turnpikes;" "Notes on Paving," by Thomas R. Wickenden, of Toledo; "Cleveland City Pavements," by M. E. Rawson; "Street-Crossings and Sidewalks," by R. A. Bryan, Portsmouth; "Street Grades and Records," by W. H. Jennings, Columbus: "Construction, Maintenance, and Repairs of Short-span Highway Bridges," by S. A. Buchanan, Bellefontaine: "Computation of Strains in Highway Bridges," by Professor C. N. Brown, Ohio State University; H. T. Lewis, on "Bridge Details;" "Lifting and Moving of Bridges," by Thomas H. Johnson, Columbus: "Pile Foundations," by Julian Griggs, Columbus; "Masonry as Applied to Railroad Work." by A. G. Pugh, Columbus; "Puzzles for the Enquirer," by W. A. Gain, Sidney; "Comparative Cost and Efficiency of Tile Drain and Open Ditches," by E. O. Opedycke, of Bryan; "Street Grades and Monuments," by C. S. Lee, of Marysville; "Monumenting," by F. Hodgman, of Climax, Mich.

On the morning of the last day the reports of the retiring officers were submitted and approved, and a number of

On the morning of the last day the reports of the retiring officers were submitted and approved, and a number of

officers were submitted and approved, and a number of papers were read and discussed, among them being one by W. C. Rowe on the Circleville water-works; also, one by B. F. Bowen, of Columbus, on "Mortar," and by William Reeder, of London, of the "Difficulties of Surveying in the Virginia Military District."

A petition signed by W. H. Jennings, chief engineer of the Hocking Valley Railroad Company, and nine other Columbus engineers, asking for permission to form a local association, was favorably acted upon. The Committee on Legislation reported in favor of abandoning the wortless portion of the Ohio Canal, but no action was taken on the report other than its acceptance. the report other than its acceptance.

matter of an exhibit during the Centennial in Columbus in September was referred to the local members of the association with power to act. The Committee on Legislation was instructed to formulate a bill to govern

Legislation was instructed to formulate a bill to govern the qualifications of persons acting as civil engineers in this State, for presentation at the next annual meeting. At the afternoon session J. N. Bradford, cf Ohio State University, gave an illustrated lecture on 'Duplication of Blue Prints," and Mr. Cully read a paper on 'Landscape Engineering."

The following persons were elected members: B. E. Cutler, Zanesville; Alvin Morrow, Paulding; Henry E. Mann, Ashtabula; W. H. Leggitt, Columbus; James T. Egerton, Ironton: Frank Snyder, Columbus; William J. Hester, Cambridge; George B. Nicholson, Cincinnati; M. P. McCoy, Van Wert; James Swisher, Urbana; A.W. Jones, Columbus; T. H. Doyle, Legan; Samuel Huston, Steubenville; E. C. Slater, Findlay; D. R. Slattermann, Dayton; H. J. Lewis, Columbus; M. J. Riggs, Toledo; G. A. Masters, Toledo; Samuel Bachtelle, Columbus; J. M. Harper, Cincinnati. Prof. Edward Orton was elected an honorary member.

The following officers were elected; President, J. D. Varney, Cleveland; Vice President, O. B. Opdycke, B Varney, Cleveland; Vice President, O. B. Opdycke, Bryan; Secretary, C. N. Brown, Columbus; Treasurer, F. G. Sager, Columbus; Trustees, W. H. Jennings, Columbus; T. R. Wickenden, Toledo; F. M. Davidson, West Manchester; C. A. Judson, Sandusky; William Reeder, London

Suitable resolutions were adopted on the death of I.S.

Ellis, a member.
The meeting, which has been the most successful in the history of the organization, adjourned until the next annual meeting, which occurs next year in the same place.

A NATIONAL BUREAU OF HARBOR AND WATERWAYS.

THE following bill. which is of interest to engineers, has been introduced into the Senate of the United States by Senator Collum, of Illinois, who was active in securing the passage of the Inter-State Commerce Act;

Be it enacted by the Senate and House of Representives of the United States of America in Congress assembled. That there shall be under the War Department a bureau to be known as the Bureau of Harbors and Waterways, to be officered by a corps to be known as the Corps of United States Civil Engineers.

ates Civil Engineers.
SEC. 2. That it shall be charged with the construction execution, conduct, and preservation of the harbor and waterway works in aid of Lavigation, now completed or waterway works in aid of lavigation, now completed or possessed, or in the course of construction or operation by the United States, including what is known as snagging and dredging operations; and all such works as may now or hereafter be provided for by law; and the making of all examinations, surveys, plans and estimates, relating to harbor and waterway improvements; and it shall be charged with the supervision of all crossings of navigable waterways which are under the control of the United States. ways which are under the control of the United States; and it shall be charged and intrusted with the care of all and it shall be charged and intrusted with the care of all the beats, instruments, implements, and plant of ever kind relating to such operations, werks, examinations, and surveys; and all the records and documents relating to the same as may now be, or may hereafter become the property of the United States, all under the direction and authority of the Secretary of War; and the President shall see that the transfers herein contemplated are fully and promptly made. and promptly made.

SEC. 3. That there shall be a chief of this corps, one learned and experienced in civil engineering, and especially with reference to harbor and waterway works, who shall be located at Washington. There shall likewise be four associate chiefs located at Washington, and of qualifications similar to those required for the chief, and they shall be known, without distinction of rank among themselves, a associate chief engineers. One associate chief selves, as associate chief engineers. One associate chief shall be assigned to duty in the office of the chief, and the others shall be assigned to such divisions of the harborand waterway works as the Secretary of War may approve or direct. The chief shall be charged, under the Secretary of War, with the execution of all laws and duties pertaining to the corps, and during his absence or sickness the associate chief in connection with his office shall act in his stead or under his lawful orders. These engineers shall also constitute an advisory board for all such questions as may be submitted or referred to them by the department engineers, by the Secretary of War, or or Congress. There shall be not more than eleven or less than nine engineers to be known as department engineers. who shall have charge of such divisions into departments as may be made of the harbor and waterway works, and they shall be located at such central or convenient points in the departments as may be directed. There shall be as many engineers, to be known as division engineers, as may hereafter be required, but not to exceed fifty in number.
who shall have charge of such groups of works and surveys in the several departments as can be conveniently administered from the same headquarters. There shall be as many engineers, to be known as first assistant engineers, hereafter be required, but not to exceed one hundred in number, who may have local charge of the works and surveys under the direction of the division engineer.
There shall be as many engineers, to be known as second assistant engineers, as may be hereafter required, but not to exceed two hundred in number. There shall be as many cadets, to be known as cadet engineers, as may be hereafter required, but not to exceed two hundred and fifty in All officers and cadets shall be citizens of the United States.

SEC. 4. That the chief engineer of the corps of civil engineers may be appointed from the present corps of military engineers, but of not lower rank than colonel in said military corps, and half of the associate chief engineers of said civil corps may be appointed from the military corps, but of not lower rank than lieutenant-colonel in said corps. Five of nine, five of ten, or six of eleven of the department enginers may be appointed from the military corps, but of not lower rank than major in said corps. One-half of the division engineers herein provided tor may be appointed from among the officers of the military corps, but of not lower rank than captain in said corps. Twenty of the first assistant engineers of the civil corps may also be appointed from the military corps, but of not lower rank than first from the military corps, but of not lower rank than first lieutenant in said corps.

SEC. 5. That the chief engineer of the civil corps, the associate chief, department, division, first and second assistant engineers of said corps shall be appointed by the President by and with the advice and consent of

Digitized by GOOGLE

the Senate. In the initial organization of the corps the appointment of associate chief, department, and division engineers shall be made upon the recommendation of the commission hereinafter provided for; and the appointment of first and second assistant engineers shall be made upon the recommendation of the board of United States civil engineers established by the President. The cadets of this corps shall be appointed by the Secretary of War upon examination by a duly-constituted board. All appointments to this corps shall be with special reference appointments to this corps shall be with special reference to experience, capacity, training, and fitness for the kind of work assigned to this corps, and in case of the office of chief engineer of said corps becoming vacant, it shall be filled by the appointment of one of the associate chiefs to that office; and vacancies in all other grades shall be filled by promotion from the next lower grade of the corps; Prov ded, however. That one-third of the vacancies occurring in any one year in the grades of second assistant engineer and first assistant engineers may be filled by engineers not formerly members of the corps, who may present themselves as candidates and submit to such exampresent themselves as candidates and submit to such examinations and tests as may be provided for in the rules and

SEC. 6. That the relative rank in each grade below that of associate chief engineer shall be determined by date of commission, and in the initial organization of the corps the engineers from the army shall takerank in alternate position with the civil engineers in each grade. Promotions from any such grade to a higher shall be in the order of seniority: Privided, however, That such senior officer in the grades of first assistant, second assistant, and cadet engineer shall be recommended for promotion by the examining board herein provided.

SEC. 7. That engineers from the army who shall accept appointments in this corps may resign any time within two years from the passage of this act and resume their connection with the army, without impairment of rank. As long as this option is retained they shall receive their pay in the usual manner as officers of the army on detached during dutv.

SEC. 8. That in making appointments to this corps below the grade of department engineer they shall be made upon the basis of work being, or that may be, conducted as herein authorized.

SEC. 9. That the pay of the officers of this corps shall be at the following rates per annum: Chief engineer, ten thousand dollars; associate chief engineer, seven thousand thousand dollars; associate chief engineer, seven thousand five hundred dollars; department engineer, six thousand dollars; division engineer, four thousand dollars; first assistant engineer, two thousand seven hundred dollars; second assistant engineer, one thousand eight hundred dollars; cadet engineer, one thousand dollars. All officers of this corps shall receive actual traveling expenses while traveling under orders; and the Secretary of War may employ special engineering counsel in connection with works he may deem of sufficient difficulty to make this step necessary: *Provided*, That funds for this purpose shall have been provided for by Congress.

Sec. 10. That when any officer of the corps arrives at

SEC. 10. That when any officer of the corps arrives at the age of sixty-five years, he shall be retired from active service in the corps, and shall, after such retirement, receive one-half of the per annum rate of pay to which he was entitled at the time of his retirement.

SEC. II. That no offier of this corps shall be employed upon work other than that assigned to this corps, except on the special order of the President, and such orders shall be reported to Congress by the Secretary of War.

SEC. 12. That for the purpose of formulating a system of rules and regulations for the proper administration of the duties of this corps, and for such other purposes as herein provided, the President shall appoint a commission, to consist of three Army engineers, of not lower rank than the grace of lieutenant-colonel, and three civil engineers, the grade of lieutenant-colonel, and three civil engineers, citizens of the United States, all of high attainments in engineering ability and experience. It shall be the duty of this commission to carefully prepare and present to Congress, as early as practicable, a system of rules and regulations for the government, direction, and guidance of the Corps of United States Civil Engineers, in matters pertaining to disbursement of funds, projects and care of property, discipline, employees, and all other matters which may properly come within the scope of such rules and regulations. This commission shall also nominate to the President such civil and military engineers as they may and regulations. This commission shall also nominate to the President such civil and military engineers as they may deem specially fitted for commission in the grades above first assistant engineer in the Corps of United States Civil Engineers. Such members of the commission as may not be under pay as Government officials shall receive a salary of four hundred and fifty dollars per month; and all nembers shall be paid their necessary traveling expenses. To defray the expenses of the commission, and for the compensation herein provided, the sum of ten thousand dollars is hereby appropriated, to be expended under the direction of the Secretary of War.

SEC. 13. That the Secretary of War shall divide the country with relevence to the harbor and waterway works into not less than nine, and not more than eleven departments, as nearly equal and uniform as may be, relative to drainage areas and topographical features, and the importance of harbors and waterways; and every department shall be under a department engineer.

SEC. 14. That no appropriation or allotment of money for a harbor or waterway shall be expended upon such work unless it is sufficient to provide for the completion of said work, or unless, in addition to the current appropriation, provision shall have been made

by law for funds necessary for its completion: Provided. That this shall not apply to snagging or dredging operations continuous in their nature, or to the care and keep of plant, property, and works, or to the operating of works wholly or partially completed, so as to be useful to commerce, such as locks and dams, or if the funds provided are adequate to complete in a permanent manner a particular and distinct stretch, reach, section, or part of said work, which shall, by and of itself, be sufficiently beneficial to commerce to justify the completion of said beneficial to commerce to justify the completion of said stretch, reach, section, or part, or to work that is designedly of a temporary character: Provided, however, That the funds spent upon a part of a temporary work shall contemplate as much stability for the part as is contemplated for the whole work: And provided further, That the expected benefit to commerce of the partial improvement shall be positive and advisable; it being the purpose and intent of this act that no power or discretion shall rest with the engineers or War Department to spend public money when they know and admit that the amount shall rest with the engineers or War Department to spend public money when they know and admit that the amount applicable to a work is insufficient to serve any useful public purpose, in connection with benefits to commerce or the completion of the work. No work shall be done except under a distinct and detail plan for each work, accompanied by estimates of annual needs of funds, and of the amount necessary for completion, and unless approved and authorized by Congress; and the Secretary of War shall carefully examine into all failures to complete work within the specified limits of time and money, and into all reasons assigned therefor, and report the same into all reasons assigned therefor, and report the same to Congress at each regular annual session, and he shall enforce the highest degree of economy, efficiency, and responsibility among and upon the members of this corps, and a rigid compliance with law by it, and he shall report to Congress upon those subjects at each regular annual session. Funds once appropriated for these works shall remain available for them until covered back into the Treasury by Congress; but allotments of a general fund, made by Executive authority, may be changed by order of the Secretary of War. SEC. 15. That in the preparation of plans and estimates,

and in reports upon the progress and conduct of works and operations all reports shall be made to the officer next in authority, to be duly and fully transmitted to the Secretary of War, and by him so transmitted to Congress Secretary of War, and by him so transmitted to Congress at each regular session. All transactions, expenditures, and results shall be fully reported in detail. In each annual report there shall be a financial statement under the head of each separate work, giving the original estimate of cost for total completion, the amount expended and on hand at the close of the last fiscal year ending June thirtieth of each year, the amount originally stated as required for each year, the total and the annual amounts appropriated, the amount still required, both annual and total, and whether the same is provided for.

SEC. 16. That in reporting plans and estimates as Congress may order, and in advising and recommending alteration of plans and estimates, the officer in local charge of the work shall state his views in a report to the division engineer, who shall forward it with his recommendations to the department engineer, who shall similarly forward it to the chief engineer for the consideration of the advisorv board.

SEC. 17. That each division engineer shall annually report to the department engineer upon the general commer-cial wants of his division with respect to harbor and waterway improvements, and in forwarding these reports to the chief engineer each department engineer shall make a similar report with respect to his department, and the advisory board shall likewise consider the matter in its broad na-tional relations; each shall report upon the present and probable commercial wants of their respective fields, and they shall consider and report upon them with respect to both their present and commercial wants, stating what may be deemed advisable improvements and what are the maximum improvements their harbors and waterways are capable of, it being the intent that all work shall tend to the most perfect class and standard of work, and, as far as may be, developed into a complete and harmonious national system. The advisory board is directed to recommend to Congress the best methods to obtain these results.

SEC. 18. That all estimates and requirements for this corps, or for the work under it, shall be reported by the Secretary of War to the Secretary of the Treasury, and be by him incorporated in the Book of Estimates and reported to Congress.

SEC. 19. That in case the officers of this corps shall, in obedience to the requirements of public works, as herein prescribed, exceed in number the subsequent requirements of the public works owing to the lack of appropriations, or for any other cause, the Secretary of Warshall temporarily refire those officers not actually employed upon halt pay, and during such period of retirement they may accept employment outside of Government service, subject to the approval of the Secretary of War; but otherwise the officers of this corps shall not hold any other civil office or engage in any civil or military occupation of a protessional character; and the Secretary of War may, out of the funds which may be provided for that purpose, detail officers to visit foreign works and study foreign methods and report upon the same.

SEC. 20. That the Secretary of War shall provide such Looks and methods of instruction for the corps as he may deem best and for which Congress may especially provide.

SEC. 21. That the Secretary of War shall have work done by contract, after due advertisement, when he shall be satisfied that such work can be done more cheaply, and

as efficiently, in that way than in any other way and to the best interest of the Government; and he shall take adequate bond and security for the proper performance of the contracts, and all such proceedings shall be reported in full to Congress.

SEC. 22. That all parts of acts in conflict with this act are hereby repealed, and all offices in connection with these works other than those offices herein provided for are hereby vacated and the offices abolished: *Provided*, I hat this does not relate to the corps of army engineers, except as to appointments herein provided for; but no vacancies in said corps hereby caused are to be filled more rapidly than now provided for by law.

THE VOSBURGH TUNNEL.

A DESCRIPTION of its construction. Illustrated. Published with the permission of the Lehigh Valley Railroad Company by Leo Von Rosenberg, 35 Broadway, New York. 1887. 8½x11¼. 56 pp. Price, \$1.

This tunnel is in Wyoming Co., Pa., on the line of the Pennsylvania and New York Canal and Railroad, and, by piercing a high neck of land making a loop in the north branch of the Susquehanna, which the railroad here follows, a distance of more than four miles is saved. It was begun in 1883 and opened for traffic in 1886, in which year the road carried over three million tons. It is a was begun in 1883 and opened for traffic in 1886, in which year the road carried over three million tons. It is a double-track tunnel, 3,902 feet long. The error in meeting of the headings was: In line, 5% of an inch; in grade, 3% of an inch, and in distance less than one inch. Except for 250 feet the tunnel is in rock. The Chief Engineer was A. W. Stedman, Chief Engineer of the Lehigh Valley Railroad and associated lines. The engineer in charge was G. B. Owen, and the resident engineer, Isaac Dox. The contractors were Lents & Co.

In his preface the author says: "The Chief Engineer

In his preface the author says: "The Chief Engineer of the Lehigh Valley Railroad Co. assigned to the writer, who was then in the service of the engineering department of the road, the duty of preparing a set of drawings which would faithfully illustrate the methods employed in the construction of the Vosburgh Tunnel. These drawings were carefully prepared from working plans and personal examinations of the work. The material thus gathered has been supplemented by further interesting data and illustrations, so as to present an accurate and complete illustrations, so as to present an accurate and complete account of this important engineering work."

The promise of the preface seems to be well fulfilled in the book, which will be of much interest to any engineer and of special value to those engaged on similar work. It would be fortunate for the profession if all its important works were as carefully described.

JOHN A. BAILEY.

JOHN A. BAILEY, for many years engineer of the United States Government in connection with public works, died in Marquette, Mich., January 22, aged sixty-nine years. He entered the service of the Government in 1850, and had He entered the service of the Government in 1856, and had charge of the construction of the lighthouses along the Atlantic coast. He superintended laving the cable from Florida to Cuba; erected Spectacle Reef Light, in Lake Huron, in 1871. The last public work which he completed was the building of St. Annan Rock Light in Lake Superior. At the time of his death he was superintending the erection of the buildings of the Michigan branch State's prison at Marquette. prison at Marquette.

PERSONAL.

LIEUTENANT-COLONEL WILLIAM LUDLOW, Corps of Engineers, U. S. A., has been relieved from duty as Engineer Commissioner, District of Columbia, and Major Charles W. Raymond has been appointed by the President to fill the vacancy.

THE firm of Keister & Wallis, architects, with offices at Broadway and Thirty-third Street, New York City, has been dissolved. Mr. George Keister and Mr. Frank E. Wallis will continue the practice of their profession separately at the old address.

R. E. BRIGGS, late Resident Engineer of the Union Pacific Kailroad, has been made Chief Engineer of the Denver and Rio Grande Kailroad, and will have charge of the location and construction of new lines and general supervision of maintenance of way, including track, bri ges, buildings, and other structures, right of way and real estate.

GEORGE T. JARVIS, C. E., has been appointed Super-GEORGE T. JARVIS, C. E., has been appointed Super-intendent of the Duluth, South Shore and Atlantic Rail-road, which is almost completed. Mr. Jarvis is twenty-eight years old, a graduate of the University of Toronto, and he subsequently took a special course in mechanical engineering at the Massachuset.s Institute of Technology. He has been employed by the Pennsylvania Company, and is at present Division Superintendent of the Mexica n Central Railroad.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITIONS.

RICHMOND, VA —The Masonic Temple Association has issued a circular, containing instructions, etc., to architects who may desire to enter into the competition, to furnish The following extract plans for the edifice. from the circular contains the terms of the competition:

"For the best design, accepted by the

Board, no premium will be paid, but the architect submitting it will receive \$3,000 in consideration of his furnishing, in addition, confideration of his furnishing, in addition, complete plans with full specifications and working drawings, the accuracy and completeness of all to be guaranteed by him, the \$3,000 to be payable as follows:

"Five hundred dollars on acceptance of the

plans, \$500 on receipt of the complete working, drawings and specifications, \$1,000 when the building reaches the second floor, and \$1,000 when the building is completed.

"For the second best plan, \$500; for the third best plan, \$300; for the fourth best

plan, \$200.

"The designs to be sent to the Committee on Plans, care of W. B. Isaacs, Secretary and Treasurer, not later than the 20th of March, 1888.

"The committee reserves the right to reject

any and all the designs submitted

The building is not to exceed \$100,000 in cost, is to be supplied with heating and ventilating apparatus, elevator machinery. etc., and is to be built of brick, stone (the latter of best quality), and terra-cotta ornamentation if desirable. All plans submitted must come if desirable. All plans submitted within the \$100,000 appropriation.

A copy of the complete circular can be had by addressing Secretary Isaacs.

HUNTSVILLE, TEX.-Plans are wanted at this place, until February 13, for a courthouse for Walker County, to cost \$22,500. Address J. M. Smither, County Judge.

GEORGETOWM, TEX.—Plans are wanted at this place, until February 13, for a jail and jailer's residence. Address W. M. Key.

TAMPA, FLA.—Plans are wanted at this place, until February 7, for a jail, to cost \$15.000. Address W. F. Givens, of Jail Committee.

MERRILL, WIS.—Plans are wanted for a city hall building. Ad ress the City Council.

BUFFALO, N. Y .- Plans are wanted in this city for a Masonic temple, to cost \$150,000. No date specified. Address R. H. Bickford, of the Masonic Temple Building Committee.

JOLIET, ILL.-Plans are wanted for a new Address the City Hall Building city hall. Committee.

BUFFALO, N. Y.—Plans are wanted for numerous school buildings, the total cost of which will be \$250,000, to be erected in the city. For details address Mr. Crocker, Superintendent of Schools.

FINDLAY, O .- Plans are wanted for a church edifice for the United Brethren Church Society.
Address the Rev. J. G. Radabaugh, pastor.

CHATTANOGA, TENN.—Plans will soon be wanted for a Catholic church. The details can be had by addressing the Rev. Father Walsh, rector.

SIOUX CITY, IOWA.—Plans are wanted here for a \$25,000 church for the Congretional Society. For details address T. J. Stone, of the committee to secure plans.

LAKE VIEW, ILL.—Plans are wanted for a church for the St. Peter's Episcopal Society. Address the Building Committee.

NEENAH, WIS.—Plans are wanted for a \$10,000 school building. Address the School Board.

TRADE CATALOGUES.

HENRY R. WORTHINGTON, New York, has recently issued a new general catalogue illustrating the Worthington steam-pumping machinery, independent condensers, and water-meters manufactured by him. The illustrations are fine specimens of wood engraving. Pumps for apparently every duty seem to be illustrated in its pages. It will be sent gratuitously to these interested in its pages. It those interested.

For works for which proposals are requested see also the "Proposal Column," pages i-v-vii-viii-144.

Persons who make any use of the information they not in these columns we trust will not omit to mention HE Engineering & Building Record as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and relable news for our "Contract ng Intelligence." Information of importance sent to us exclusively, and not eisewhere published, will be liberally paid for.

WATER, SEWERAGE, ETC.

MONTGOMERY, ALA.—The Committee on Sanitation has submitted the report of Mr. Rudolph Hering. C. E. The report suggests that that portion of the city at the foot of the ridge be sewered with plain sewer-pipe. He does not recommend any special system, allowing roof-water to enter or not at the discretion of the council. He recommends the diameter of the pipes to be eight inches. As to the depth of the sewers he advises them to be at least twelve feet deep in order to give ample draininge to the buildings. Outside of this area the depth could be six or seven feet. Manholes or shafts leading down to the pipe from the street surface large enough for a man to enter are desirable in order for a man to go down into sewers and remove the obstructions. He recommends that they be placed at the in-tersection of every street, and that flush-tanks be built at the highest ends of the sewers and be suddenly discharged in order to keep pub lic sewers clean and free from stoppage. The best pipe of the best material should be used and an inspector should be constantly present under the direction of the City Engineer to see that nothing but first-class material should be used. The supplement report of Mr. Hering will be submitted as early as practicable. It will give full and complete estimates of the cost of giving that portion of the city of Montgomery north of the ridge a complete system of sewerage.

LANCASTER, PA .- Extensions are to be made to the water-works in the shape of a 60-foot culvert which is to be built under the Pennsylvania Railroad tracks to connect the new water-works and the reservoir.

WHEELING, W. VA .- An improvement is to be made to the water-works in the shape of additional valves and machinery that will permit of pumping water directly into the mains without sending it to the reservoir. The water-works superintendent has charge of the

BRISTOL, TENN.-Howard Murphy, C. E., of Philadelphia, has submitted his report in regard to a system of water-works, which states that \$90,000 should be expended on the system. Official action matter at an early date. Official action is to be taken in the

GA. — Concerning CARTERSVILLE. water-works question here, our correspondent writes as follows: "The city authorities have appointed committees to look into the probable An engineer has been employed to get up information. Legislative enactment is necessary to get a vote upon the question as to necessary to get a vote upon the question as to whether they will be built or not, which will be had in November. Election will follow immediately after passage of act. Bonds will be issued to cover cost. There is little doubt but what the works will be erected. The committee, W. C. Baker, D. W. K. Peacock, and Charles McEwen, are hard at work, and will confer with engineers, etc."

ROCHESTER, PA. — A. W. McCoy, City Clerk of this place, writes us, under date of January 24, as follows: "A contract for construction of water-works for this place was let yesterday to Ellis Morrison, of New Castle, Pa., to be completed by January 1, 1889."

KUTZTOWN, PA.—Concerning the waterworks project here our correspondent writes as follows: "The water matter is very quiet.'

WOODBERRY, MD .- The Consumers' Water and Illuminating Company of Baltimore has awarded the contract for building the water and gas works at this place to George B. Morton at about \$200,000.

VASSAR, MICH.—The water-works question is being agitated here.

SCRANTON, PA.—William Connell, of the Meadow Brook Water Company of this place, writes us as follows concerning the intentions of the company: "We have formulated no positive plans as yet."

CRESTON, IOWA. - Concerning the waterworks question here, our correspondent writes "Franchise for water works has been granted to William S. Mercer & Co., of New York; the city takes 80 hydrants at an annual rental of 4.500. The franchise granted a year ago to ames Gamble, of New York, expired by limitation.

WACO, TEX.-Concerning the renewal of the water-works contract here, our correspondent writes as follows, under date of January 18: "Our City Council met last night as a committee of the whole and have made a contract, or agreed upon one, to be submitted to the Waco Water Co. If they accept it will run for ten years, and we will not have to bond for a new system then. Can't say what coun-cil will do if they fail to trade."

BOWLING GREEN, O.—Our correspondent writes as follows concerning the terms, etc., of the recent water-works contract: "The village has entered into a contract with Ferris & Halladay, of Jersey City, for the construc-tion of water-works here, they owning the works, and the city paying them an annual rental for the hydrants; the contract is for 30 rental for the hydrants; the contract is for 30 years, with the privilege reserved to the city to purchase the same at any time after ten years; the vote taken on Monday, January 16, to ratify the contract resulted in the ratification of the contract by the following vote: to ratify the contract, ayes, 38; nays, 116. The works contemplate! will cost about \$60,000."

MARION, VA.-Our correspondent writes: "A contract to construct water-works at this place was let to the Glamorgan Co. Lynch-burg, Va., on the 29th of December last, who commence work about the 20th of March.

JAMAICA, N. Y.—The village trustees have formally accepted the water-works constructed by the Lockwood Company, and the introduction of water will take place at once. The works embrace several miles of pipe, about fifty hydrants, and a stand-pipe with a capacity of 600,000 gallons.

GALVESTON, TEX.—The bids for artesian well, opened January 19, were all rejected, and new proposals will be advertised for.

GREFNSBORO, N. C.-Mayor R. R. King writes: "The contract for water-works has been awarded to W. W. Taylor and Charles Hindman, of Philadelphia, Pa., and Frederick B. Hubbell, of Baltimore, Md.

LINDSBORG, KAN .- Concerning the waterworks project here our correspondent writes as follows: "This question is being agitated by our citizens generally, but no permanent step has been taken as yet. There is no doubt but what our city will get water-works

SEAL HARBOR. ME.-Concerning water-works project here our correspondent writes as follows: "The Seal Harbor Water Company was organized last spring with a capital stock of \$10,000, and this winter they have been taking subscriptions for stock. At the last meeting the hope was expressed that we should have water from Jordan's Pond for next summer's use. There will nothing definite be done before March 28, when the Presiite be done before March 28, when the President, Hon. Samuel F. Barr, formally of Harrisburg, Pa., will give us some definite plan of action. It is proposed to put on an engineer to determine how and where, and what size of main will be needed, and get all the preliminaries done ready to go to work when all the rest is fixed."

OCCNTO FALLS, WIS.—Concerning the reby the Falls, wis.—Concerning the report that water-works were to be erected here by the Falls Water Power Company, the representative of the company writes us as follows: "We are not putting in water-works, but improving a water-power."

NEW YORK CITY.—At a meeting of the Aqueduct Commissioners held January 25, the Commissioner of Public Works was directed to prepare contracts for the sinking of Shaft 24 down the necessary depth.

TROY, ALA.—Concerning the report that water-works were to be erected here, our correspondent writes as follows: "No steps have yet been taken. Troy has a small engine and pumps answering a temporary purpose, and no improvement will probably be made this year." made this year.

ST. Louis. Mo.-New water-works build. ings are to be constructed in this city, the details of which can be had by addressing the City Engineer.

AUTAUGAVILLE, ALA.—According to reports Messrs A. M. Smith and James Munn will erect a water-works system here.

WEST BAY CITY, MICH.—It is reported that a sewerage system is to be constructed here at an early date.

CARTERSVILLE, GA.—It is reported that the City Council has instructed a committee to employ an engineer to make surveys, esti-mates, etc., for a water-works system.

READING, PA.—The City Council has appriated \$20,000 for the construction of ad-

ST. JOSEPH, Mo. - About \$500,000 will be expended on the sewerage system spring. Address the City Engineer.

ELLICOTTVILLE, N. Y .- It is reported that a system of water-works will be established

GLENWOOD, IOWA.—It is probable that water-works will be erected here. BURRULLVILLE, R. I .- The water-works

question is being agitated at this place. Avon, N. Y .- It is reported that this place is to be furnished with water from Conesus

BRIDGES.

WAUTOMA. WIS.—It is reported that a bridge is to be erected at this place by the County Commissioners.

TOLEDO. O .- In reference to the report that Thomas R. Wickenden, the City Enginer, writes: "Nothing further than prepartion of plans; are awaiting the arrangement of financial matters."

LAUREL, DEL.-Concerning a report that LAUREL, DEL.—Concerning a report that the Pennsylvania Railroad was to erect a bridge here our correspondent writes: "The Pennsylvania Railroad has taken no steps yet that I know of to construct a bridge at this place, but it is badly needed and it is hoped that they will do so shortly. The Government has expended quite a sum in dredging above it and the way the bridge is it obstructs navigation."

SALMON FALLS, MASS .- Concerning the report that a bridge was to be erected here, our correspondent writes: "The town has taken no action. It is understood that a bridge will be built in the spring by the Fairfield Paper Company for its own accommodation in getting across the river. For further particulars in regard to the matter address the company. Salmon Falls, Mass."

NAVESINK, N. J.—Concerning the reported project to erect a bridge over the Shrewsbury at this place, our correspondent writes as follows: "As yet there have been no steps taken further than framing a bill to be presented to the Legislature of our State; said bill, I think. white, who resides at Oceanic, N. I., and William E. Andrews, of Navesink, N. J., are the gentlemen who will have said bill introduced."

HARTFORD, CONN.—Concerning a report that a bridge was to be erected, our correspondent writes as follows: "The city and railroads join in changing grade crossing at Asylum Street so that the railroads go over the high-way. A year ago the railroads were ordered by a special commission to do the work, and they contracted with the Berlin Iron Bridge Company for two double-track plate-girder bridges, 70 feet clear span, to carry the tracks over Asylum Street."

WHEELING, WEST VA .- The citizens of WHEELING, WEST VA.—The citizens of Ohio County have been asked to subscribe \$300,000 capital stock of the Wheeling and Harrisburg Railroad Company for the construction of a union railroad bridge across the Ohio River, with terminals at Martin's Ferry, O, and the northern part of the city of Wheeling, and the question of the appropria-tion of said amount tor the purpose specified will be submitted to the voters of the county February 4 for ratification or rejection. correspondent writes concerning the project as follows: "That the subscription will be voted I have no doubt."

BUFFALO, N. Y. - It is reported that repairs are to be made to numerous bridges in this city. Address the City Engineer.

STEUBENVILLE, O.—Engineer Tschirgi is drawing plans for a bridge to be erected here. It will be of iron and the main span will be 500 feet wide. Address him, at this place, for particulars.

JERSEY CITY, N. J.-The New Jersey JERSEY CITY, N. J.—Ine New Jersey Central Railroad Co are to have a new depot and train sheds. The architects are Messrs. Peabody & Stearns, of Boston; New York Office, Mills Building. Contracts are soon to

CHICAGO, ILL.--Press dispatches state that Major T. H. Handbury, in his report 10 Congress, says that over the stretch of eleven and one half miles, between Lake Michigan Hammond, Ind., there are ten railroad and five wagon bridges, which will prove obstructions to commerce unless reconstructed. "It is expected," he adds, "that in future the river will be taxed to its full extent, even when it is widened to 200 feet, as is contemplated. Therefore it is deemed necessary to reconstruct the bridges so as to leave a clear opening of sixty feet on each side of the

RAILROADS, CANALS, ETC.

ALTAMONTE, KY .-- The Altamonte Coal Company will, it is reported, construct a dummy line.

WILMINGTON, N. C.—It is reported that E. K. P. Osborne, of Charlotte, is at the head of a scheme to build a street railroad here.

LEEDS, ALA.-Stewart & Pickett are at the head of a scheme to establish a street railroad.

GAS AND ELECTRIC-LIGHTING.

BUFFALO, N. Y .- It is reported that the Thomson-Houston Electric-Light Company will erect a building for its plant in this city, to cost \$40,000.

RALEIGH, N. C .- The Raleigh Lighting, Heating, and Power Company has been inco porated; capital stock, \$25,000. Morse, and others, incorporators. capital stock, \$25,000. George J.

UTICA, N. Y .- The Utica Electric Light Company has been incorporated; capital stock, \$150,000. Henry D. Pixley, and others, in-\$150,000 corporators,

HARRISBURG, PA .- The Harrisburg Electric-Light Company has increased its capital stock from \$1,00,000 to \$150,000, and will make extensive improvements to its plant.

DECATUR, ALA. - It is reported that Chicago, Ill., parties are to erect \$200,000 gas-works and that the Decatur Land Improvement and Furnace Company can give information.

SAN FRANCISCO, CAL.—The Standard Gas Company will erect extensive works at North Beach. Address the president.

BALTIMORE, MD.--The Edison Electric-Light Company, of Baltimore, has been incorporated. It proposes to light streets, resiporated. It proposes to ngitt streets, residences, and other buildings, and provide motive power for machinery. The company intends to place all its wires under ground.

MARSHFIELD. WIS .- It is reported that an electric-light plant is to be established here.

ANAHEIM, CAL. - The streets of this place are to be lighted by electricity.

FORT SMITH, ARK.—The plant of the Fort Smith Gas Company is to be greatly enlarged, and a better service established. Several miles of additional supply pipes will be laid, which will penetrate present unoccupied territory, and the capacity of supply will be increased at least fourfold. For particulars address P. R. Davis, President of the comBELLAIRE, WEST VA.—An electric light company has made application to the town officials, asking for a franchise to light the public streets, etc.

WHEELING, WEST VA. -- A new company wheeling, west va.—a new company has been organized to pipe natural gas to this city. The gas will be taken from wells in Washington County, and the pipe line will be twenty-four miles in length.

STREET WORK AND PAVING.

SAN FRANCISCO, CAL.—The Board of Supervisors are considering the question of expending several thousand dollars on street improvements. Address the president of the board for particulars.

PUEBLO, COL.—The City Council has decided to commence work at once upon the levees on the east side of the Arkansas River running through the city. They will cost about \$10,000 and will include a fine boulevard along the river.

BIDS OPENED.

St. Paul, Minn —The following proposals ST. PAUL, MINN—The following proposals for s'eam heating at the new jail have been received by the Police Commissioners of this city: E. T. Sykes & Co.. \$1,340; F. F. Martin, \$1,344; Haxtun Steam Heating Company, \$1,590; Porter Steam-Heating Company, \$1,650. The contract was awarded to E. T. Sykes & Co.

LITTLE ROCK, ARK.—Contracts for the first division of the City Electric Railway, have been let to R. F. Wilson, of Chicago, at the following prices: Tram rail per ton, at the following processing grading, 50c. per cubic yard. Hauling and delivering material, iron, 85c. per ton; ties, etc., 85c. per 1,000 feet B. M. Track-laying, ballasting, etc., per mile, \$375, T rail per ton; grading, 19½c. per yard. Hauling and de-livering material, iron, 80 cents per ton; ties, etc., 80 cents per 1,000 feet B. M. Track-laying per mile, \$325. For macad-amizing the tracks and two feet on the outside, \$300 per mile. Rock excavation, per yard, \$1.60. Trestling and trench work per yard, \$1.60. Trestling and trench work, per 1,000 feet B. M., \$12. Taking up and relaying block pavement, \$1.50 per square yard. Contract for tees awarded to S. V. Hafer, Little Rock, Ark., at \$12 per 1,000 feet B. M.

WILLIAMSPORT, PA .- Bids for sewers in on the 18th inst., with the following results: Gale & Myers, Washington, D. C., \$153,951.-71; J. I. Coogan, Bergen Point, N. J., \$116,-102.40; Clark Excavating Co. Elmira, N. Y., \$113.835.30; Jacoby & Madden, Bridgeport, Conn., \$105.887.35: Costello, Nagle & Co., Elmira, N. Y., \$100.622.07; B. J. Coyle & Co., Washington. D. C., \$93,233.88. Engineer's estimate \$114 487.22.

LIMA, O .- The Lima Electric Light and Power Co. has received the contract for lighting the city at an annual cost of \$6,000.

DOVER, N. J .- The following bids for lighting public streets have been submitted to the Common Council: Dover Electric Light Co., 20 incandescent lights of 20, 30, 40, or 45 candle-power, at the rate of one cent per hour for each candle-power, the price not to exceed 15 cents a lamp per night. John Maher, Philadelphia, Pa., proposed to put in an electric-light plant without any guarantee from the town, and, if the light proves satisfactory, to enter into contract to light the town. The cost of arc lights would not exceed 40 cents per night for each lamp of 2,000 candle-power, and one cent per hour for each incandescent and one cent per neur for each incandescent light of 16 candle-power. Maher also proposes, in consideration of the franchise, to supply the town with two arc lights free of charge. The bids were referred to the Committee on Street Lighting.

BROOKLYN, N. Y .- Synopsis of bids opened January 18 for repairing the turning gear of Hamilton Avenue Bridge: Norman Hubbard, work complete, \$3,250.

DALLAS TEX. -The contract for constructing water-works here has been awarded to Michael Lally, of Detroit, Mich., at a cost of 50,000. The Holly system will be used see and distribute the water. The work \$450,000. The work to be done requires the building of two reseror two reservoirs, the furnishing and laying of pipe, setting of hydrants, etc., and the construction of an engine house. The pipe and materials, excep those to be furnished by the Holly Company, have not yet been engaged.

GALVESTON, TEX .- The Board of Commissioners to construct the new water-works for the city has awarded the contracts aggregating about \$400,000. The Knowles Steam Com-

pany, of New York, was awarded the contract for two engines, with 3,000,000 gallons capacity per day. Gordon & Maxwell, of Hamilton, O., the boilers; R. D. Wood & Co., of Philadelphia, the pipes and castings; contract for laying the pipes, Merigold & Co., Lima, O.; stand-pipe and tanks to Moffett, Hodg-kins & Clarke, Watertown, N. Y. The con-tract for valves, Eddy Valve Company, Water-ford, N. Y. The plant embraces forty-one miles of pipes. All bids for artesian wells were rejected and new bids will be advertised. The commissioners have reserved \$50,000 for artesian wells.

COLUMBUS, O .- Synopsis of bids for furnishing the Ruttan-Smead System of steam-heating for three school buildings, opened January 19 by the Board of Education: January 19 by the Board of Education: Isaac D. Smead & Co., Toledo, O., \$2,765, \$1,843.33, and \$1,843.33. No other bids.

MOUNT MORRIS, N. Y .-- Synopsis of bids for furnishing cast-iron pipe, hydrants, special castings, etc., opened January 20, by cial castings, etc., George W. Phelps:

Warren Foundry and Machine Co.. New York City, 6 and 8 inch pipe, net tons, \$32.20, at Mount Morris.

Buffalo Cast-Iron Co., Buffalo, N. Y., 4inch pipe, net tons, \$34.60, at Mount Morris,
John Fox, New York City, 4, 6, and 8 inch pipe, net tons, \$32, average size pipe, net tons, \$34, at Mount Morris,
M. J. Drummond, New York City, 4, 6,

and 8 inch pipe, gross tons, \$33.33, at Mount

McNeil Pipe & Foundry Co., Burlington, N.J., 4, 6, and 8 inch pipe, gross tons, \$31, at Mount Morris.

Donaldson Iron Co., Quincy, Pa., 4, 6, and 8 inch pipe, net tons. \$30, at Mount Morris. Addyston Pipe & Steel Co., Cincinnati, O.,

6. and 8 inch pipe, net tons, \$31.50, Cairo, Mich.

Detroit Pipe and Foundry Co. Detroit, Mich., 4, 6, and 8 inch pipe, net tons, \$27.95, Cairo, Mich.

Reading H. M. Co., Reading, Pa., 4, 6, Reading H. M. Co., Reading, Pa., 4, 6, and 8 inch pipe, net tons, \$30, Cairo, Mich. Collins & Humphrey, Pittsburg, Pa., 4, 6, and 8 inch pipe, net tons, \$28,60; hydrants, \$26 each; front jackets, \$3 25 each. Builders' Iron Foundry, Providence, R. I., special castings, 2c. per lb. Eddy Valve Co., Waterford, N.Y., hydrants, \$26 each; valves 2, inch \$2. 4 inch \$8 ac. 6

\$26 each; valves, 3-inch, \$7; 4-inch, \$8.25; 6 inch, \$14.25; 8-inch, \$21.

AVELON, N. J .- The contract for building new hotel at this place has been awarded to E. R. Williams, of Cape May, for \$35,000.

MINNEAPOLIS, MINN. - Proposals for furnishing water-pipe materials have been opened by Council Committee on Water-Works as

Harry McAmy, 21/2 cents per pound, with a discount of 1 per cent; Thomas Mullaly, 2½ cents, less 1-10 of 1 per cent; Smith, Richardson & Swartz, 2.37½ cents; Lockman, Upton & Co., 2½ cents less 1-10 of 1 per cent.; North Star Iron Works, 23/2 cents. less ½ per cent.; Crown Iron Works, 2.95 cents; Northwestern Foundry, 2½ cents. The committee will recommend that the contract be given to McAmy, as his was the lowest bid.

GOVERNMENT WORK.

WASHINGTON, D. C .- The following bids were opened January 10 at the office of the engineer of the sixth lighthouse district for material, etc., for the revetment and jetties for the shore protection of the Cape Canav

eral, Fla., light station:
Stemmever Lumber Manufacturing Company, Charleston, S. C, lot No. 1. lumber,

\$1.597.95.
Bailey & Lebby, Charleston, lot No. 2, hardware, \$174.65 (accepted); lot No. 3. steam-pumps, boilers, etc., \$610.10 (accepted), C. S. Pitcher, Charleston, lot No. 2, \$203,-

C. S. Pitcher, Charleston, 192 40; lot No. 3, indefinite. Cameron & Barkley Company, Charleston, lot No. 2, \$206.36; lot No. 3, \$695.90. The bid of the Stemmeyer Lumber Com-pany was rejected. All of lot I will be pur-

WILLET'S POINT, N. Y .- Synopsis of bids for plumbing and carpentry work for fourteen public buildings and sets of officers' quarters, o ened January 23 by Captain C. P. Miller, Corps of Engineers, U. S. A.: James L. Lowry, New York, \$6,332; John Spence, New York, \$5,795; George Cody,

\$5,780; Christopher Nally, New York, \$6,895; Dixey & Dovey, Philadelphia. Pa., \$4,355; Lewis & Young, Flushing, N. Y., \$6,033; Thomas Elliott, Flushing, N. Y., \$6,0633; James F. Darmour, Flushing, N. Y., \$5,476.

WASHINGTON, D. C .- The following bids were opened at the office of the Inspector of the Third Lighthouse District January 13 for opened at the office of the Inspector of 275 stone sinkers:

James Scully, Groton, Conn., \$1,378.75. Accepted.

Charles F. Stoll, New London, Conn., \$2,-107.80.

Bodwell Granite Company, Rockland, Me., \$2,025.

PROPOSALS.

(Continued from page viii.)

TOOLS.—Proposals are wanted at Washington, D. C., until March 1, for furnishing tools and materials for the Navy Yard, at Portsmouth, Va. Address the Secretary of the Navy.

STEEL BOILERS.—Proposals are wanted at Nash-ville, Tenn., until February 2, for furnishing and erecting six steel boilers, 66 inches in diameter and 18 feet long. Address George Reyer.

RAII.WAY.—Proposals are wanted at New York City u-til March 5, for constructing a net of railways in the Island of Puerto R co. Address Miguel Suarcz, Consul-General of Spain, New York City.

COURT HOUSE.—New proposals are wanted at Liberty, Mo., for the erection of a court-house; no date sp-cified. Address County Clerk.

DREDGING.—Proposals are wanted at New York City until February 6, for dredging at Pier 7. East River; engineer's estimate about 20,000 cubic yards. Address the Department of Docks, Pier 1, N. R.

STREET IMPROVEMENTS. — Proposais are wanted at Mad-sonville, U., until February 4, for street work. Address James Griffin.

STONE JAIL .- Prop sals are wanted at Georgetown, Tex., for the erection of a stone jail \$30,000. Address the County Commissioners.

BRIDGES.—Proposals are wanted at Kansas City, Mo., for the construction of nine budges; no date specified. Address County Clerk Eurr.

CAST-IRON PIPE.—Proposals are wanted at Toledo, O., until February 7, for furnishing on beard cars in that city the following approximate qualities of water-pipe—v'z.: 75 tons of 12-inch, 20 tons of 8-inch, 146 tons of 6-inch, and 12 tons of 4-inch. The ton used shall b-2,000 pounds. Address 11 C. Cotter, Superintendent Water-Works.

RAII ROAD WORK.—Proposals are wanted at Richmond, Va., until February 10, for the clearing, grubbine, grading, masoniy, bridging, tresting, crossites, and track-laying on the part of the Oxford and Clarksville Ruilroad between Oxford. N. C., and Durham, N. C. Address R. H. Temple, Chief Engineer, P. U. Box 224, Richmond, Va.

GASOLINE LIGHTING.—Proposals are wanted t Concinnatt, O., until February 3, for lighting by assume the streets of the city for a period of one ear, according to specifications. Address Edward lenderson, City Clerk.

ARTESIAN WEI.I..—Proposals are wanted at To-ledo, O., until February 6, for boring an artesian well. Address (v. H. Cole, City Clerk,

LIGH FING STREETS.—Proposals are wanted at Marysville, O, for lighting the public streets by gas or electricity. No date specified. Address the City Clerk.

SCHOOL BUILDING. - Proposals are wanted at Biddeterd, Me., unt I February 11, for the erection of a brick high school building. Address Levi W. Stone, of the Building Committee.

IRON BRIDGE.—Proposals are wanted at Washin, ton, La., until February 10, for the construction of an 'ron draw-bridge. Address Leon Wolff, P. O. Box 27, Washington, La.

TRUSS BRINGE.—Proposals are wanted at Vernon, Ind., ut til Feoruary 6, for the construction of a Howe truss bridge. Address J. C. Cope, County Commissioner, Vernon, Ind.

PIFRS AND ABUTMENTS. — Proposals are wanted at Vernon, Ind., until February 6, for building two piers and two abutments. Address J. C. Cope, County Commissioner, this city.

WATER-WORKS.—Proposals are wanted at Brisne construction of a complete system No date specified. Address Mayor

PUMP, BOILER, ETC. -- Proposals are wanted at Morrisburg, Ontario, Can., u. til February 6, for furnishing a steam-pump, boiler, and smoke-stack for the water-works. Address F. F. Plantz, Village Clerk.

IRON BRIDGF.—Proposals are wanted at Elk City, an., for the crection of an iron bridge. No date see fied. Address H. Woodring for details.

WATER-WORKS.—Proposals are wanted at Green-ville, Tex., for a complete system of water-works. No date specified. Address the Water-Works Committee.

PI.UMBING AND GAS PIPING.—Proposals are wanted at Washington, D. C., until February 21, for furnishing all the mater als and tools and performing all the labor necessary to put in place complete the system of plumoning and gas piping required for the court house, post office, etc., building at New Albary, Ind. Address Will A. Freret, Supervising Architect. Digitized by

INTRODUCTION.

Office of Secretary,

NEW BEDFORD, MASS., November 1, 1887.

NEW BEDFORD, MASS., November 1, 1887.

This collection of diagrams is the result of the persistent efforts of Messrs. William B. Sherman, of Providence, R. I., and Walter H. Richards, of New London, Conn., who, as a Committee on Exchange of Sketches, have secured these drawings from members of the Association. The following extract from a report presented by these gentlemen at the Manchester, N. H., meeting in June, 1887, will explain in part the origin of the collection:

"In answer to circular letters sent out to members, there

In answer to circular letters sent out to members, there "In answer to circular letters sent out to members, there were received rough sketches of general plans of twenty-three water-works represented in the Association. Having this data on hand, though crude in many particulars, it was decided to put the same into available shape for the benefit of the members. This has been accomplished by the Committee without cost to the Association. From these rough sketches—revised, reduced to uniform size of 10 by 15 inches—a set of tracings has been made, and a sample folio of blue prints prepared. This folio and set of tracings are herewith presented as forming the main part of this report."

Since the Manchester meeting three more subjects have been received and subscribtions for sets of reproductions from the

received and subscribtions for sets of reproductions from the tracings have been called for. The ready response to the call is evidence of the value of the Committee's work, and arrangements were made with THE ENGINERING AND BUILDING

RECORD for publication in this present form.

THE MUNICIPAL ENGINEERING PROB-LEMS OF NEW YORK.

THE admirable message of Mayor Hewitt, of this city, devoted to the municipal engineering and rapid-transit problems of New York, which is published in full in the daily papers of the 1st inst., will be most suggestive and instructive reading to all persons interested in municipal problems in American cities. The evils from which this community suffers, and which are so ably pointed out by the Mayor, are those which younger cities should, in a measure, be able to avoid by studying our experience. With honest pride and justifiable faith in the future of this great metropolis, he forcibly points out the imperative need of adequate dock facilities, suitable pavements, and the proper control of corpora-tions who use the streets. He devotes the larger portion of his message to the great and pressing problem of real rapid-transit facilities, the lack of which so seriously retards the growth of the

We are glad to see that he has advocated the plan, recommended by The Engineering and BUILDING RECORD in an editorial on a former occasion, that the city should pay for and own the roadways on which these rapid-transit trains shall run. He truly points out that this will secure a minimum cost for construction and proper protection for the community. The details of the plans and routes that he proposes we shall not discuss at this time, but the whole subject should add interest to our description and illustrations of the Berlin Viaduct Railway, the first portion of which we present to our readers in this issue.

BACTERIOLOGICAL WATER-TESTS.

WE have from time to time informed our readers of the progress made in testing drinkingwater supplies as to the number and character of micro-organisms present in a given sample, and have pointed out that while this mode of testing water may be in some cases a useful addition to chemical analysis, it is as yet very far from being a substitute for it. The difficulties in the way of drawing definite conclusions from the results obtained by mixing a drop of the water to be tested with some nutritive material, such as gelatin, and then counting the number and noting the character of the separate and distinct colonies of bacteria which are produced, are due to the fact that in ordinary waters, not specifically contaminated, a dozen or more forms of bacteria are likely to occur; that these have different periods and modes of development; that the growth of one may interfere with that of another, and that all of these tend to increase the difficulty of determining whether the bacteria of a particular disease, such as typhoid fever, are present in the sample. One of the first difficul-ties met with in such investigations is the fact that some of the colonies produced in gelatin cultures have the property of liquefying the gelatin, and some of them do this very rapidly. This tends to prevent the development of other colonies, or at least makes it difficult or impossible to observe and register such development, and this is the main reason why water cultures have been usually limited to three days' time. Prof. Bischof has recently made public the results of a series of experiments made by him upon means of checking the growth of the

liquefying and rapidly spreading colonies, so as to permit of longer periods of culture, and thus to give to those bacteria which require more than three days to develop a chance to show themselves.

He found the most convenient means of destroying the vitality of a colony were crystallized potassic permanganate and spongy iron, either of which will, when applied in very small quantity, check the growth of a colony, while it will not poison the adjacent gelatin, and, therefore, will not interfere with the development of another bacterium of slower growth which may happen to lie in the immediate vicinity. In the experiments made by this method culture of water samples for nine days usually showed a marked increase in the number of colonies, sometimes giving thirty times as many as were obtained by three days'culture. Even after nine days new colonies may continue to appear. This fact is interesting when taken in connection with the effects of previous storage on the number of colonies and as to the differences observed according to whether the water was stored before or after Changes of development in the filtration. micro-organisms can certainly be produced by storing the water for a longer or shorter time before testing it by the gelatin culture.

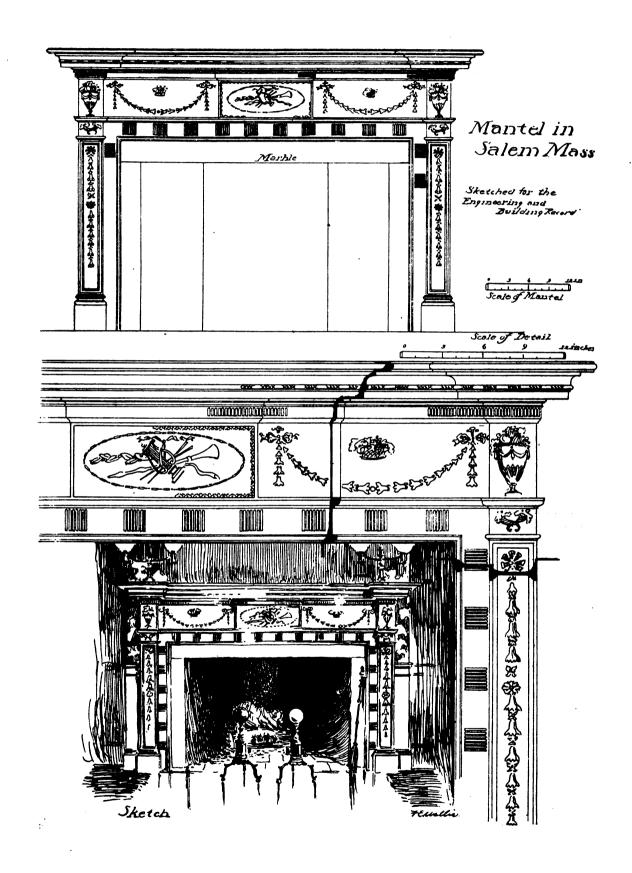

With regard to the objection that the culture tests do not distinguish between the harmless and the dangerous bacteria, it may be said that the same objection holds good with regard to the results of chemical analysis.

As a matter of fact, however, culture tests do, even with our present very imperfect knowledge, enable us to distinguish some of the dangerous bacteria if they are present. But the actual finding of the bacillus of typhoid or the coccus of erysipelas is not at all necessary to enable us to declare a given source of water-supply to be dangerous. A dangerous water-supply is not merely one which actually contains specific, pathogenic bacteria. It is one which is specially liable at times—not always—to contain such bac-This liability exists whenever a watersupply is contaminated with human excreta, and biological analysis, in the great majority of cases, is simply one means of determining whether such contamination exists. In some half a dozen cases it has been found possible to demonstrate the existence of the typhoid fever bacillus in a water-supply by culture methods, but in every one of these cases the presence of this bacillus had been practically demonstrated by the production of disease in man before the biological analysis was made. This does not prove that the method is valueless. Far from it; it rather proves that the method is one which may be relied on to furnish some good evidence that a water is contaminated with sewage, though no specifically dangerous bacteria are present in the particular sample examined, and, in the great majority of cases, this is all the evidence that is needed to indicate that special precautions should be taken in the use of such water.

HOW TO CHECK WINTER WATER-WASTE IN NEW YORK.

GENERAL NEWTON, Commissioner of Public Works of New York, has received a report from Mr. Birdsall, the Chief Engineer of that department, in which he states that within the past four weeks 11,000,000 gallons more of water have been consumed daily than the Croton and

Digitized by GOGIE

)

THE ENGINEERING & BUILDING RECORD ILLUSTRATED SERIES.

Bronx River conduits are able to supply to this city. He adds that his department has no means to stop this waste, which he says is due to people allowing their taps to run in order to prevent the water freezing in exposed pipes.

We have, year after year, pointed out the necessity of some control over the location of water-pipes in buildings with a view of prevent-

ing freezing.

As yet we believe no concerted action has been taken by the Department of Public Works and the Health Board, and even if such action were taken now, it would probably not seriously affect many of the multitude of instances of exposed pipes in houses already built. This is a very serious question, and it seems as if the only practicable alternative would be to authorize the Commissioner of Public Works to have an inspection made of every building containing a water-service pipe, and wherever pipes are found so exposed as to be liable to be frozen, then in all such cases, meters should be placed on the service-pipe at the cost of the owner pending such alterations as will secure protection from frost and the consequent temptation to waste. In other words, the waste must be stopped, and the quickest and cheapest way would seem to be to put a meter on every service-pipe where there is a reasonable possibility that the water passing through it will freeze if at rest.

A NOTABLE HOSPITAL FOR MONTREAL.

A BOARD of Governors, with the Honorable J. J. C. Abbott, Q. C., as President, has been organized under a charter obtained during the last session of the Dominion Parliament of Canada, for the constitution of the Royal Victoria Hospital about to be erected for the city of Montreal through the munificence of Sir George Stephen, Bart., President and Director of the Canadian Pacific Railway, and Sir Donald Smith, K. C. M. G., M. P., also a director of the Canadian Pacific Railway and of the Hudson Bay Company. These gentlemen have given \$1,000,000 for the purpose of the foundation of the institution, and the corporation of the city has supplemented the gift by granting as a site for the new building a lease in perpetuity of a plot of land about twelve acres in extent, situated near to the north-east angle of Mount Royal Park, at an elevation of about 300 feet above the St. Lawrence River, toward which the city gradually slopes.

It is proposed that the establishment shall accommodate about 300 patients, and that in addition to the ordinary requirements of a hospital of that extent there shall be a training school for nurses, a medical school, and an outpatients' department.

Mr. H. Saxon Snell, F. R. I. B. A., of London, has requested by the Board of Governors to prepare a design and direct the construction of the building.

ARCHITECTURAL COMPETITIONS IN INDIA.

THE following letter in *Indian Engineering* would indicate that the methods pursued by the New York City authorities in the recent architectural competition for plans for the proposed municipal building in City Hall Park are not confined to this country:

"SIR: The advertisement launched forth by the Umritsur Municipality is both instructive and amusing. At first I thought it a hoax and a stupid one, of the Simple Simon type, but I am now convinced that it is intended to be clever. The municipality ask for complete 'working drawings, specification, and estimate.' for a hospital to cost Rs. 75,000 and offer a prize of Rs. 500. That is to say, they ask for Rs. 2,000 worth of work, and offer for it the magnificent sum of Rs. 500 in the form of a PRIZE! Such unbounded liberality should meet with a hearty response throughout India. Would you mind notifying that the undersigned will be happy to receive any number of dress-suits of clothes valued at 8 guineas each, and he will give upwards of 2 guineas for the suit which fits him the best, and, like the Umritsur Municipality, he will not bind himself to return the rejected suits, as they may be useful to him hereafter. Intending tailors will be furnished with full measurements on application. Now please don't all speak at once.

R. F. Chisholm."

THE BERLIN METROPOLITAN RAILWAY.
No. I.

AT this time, when the extention of our rapid transit facilities is attracting such serious attention, it may be interesting to inquire into the principal features of some of the systems that have been used abroad.

In Europe, London and Berlin have their completed systems.

The railway system of London has been well known for a long time, but there is less familiarity with the works that have been executed during the past few years in Berlin. They were planned at about the same time at which the New York Elevated Railway system was developed, but at Berlin, the considerations which led to the construction of the metropolitan road were in the first instance of a strategic nature. When the Prussian State Department took the work in hand, it did not have for its principal object the replacing of the several omnibus and street-railway lines, which were amply sufficient for a city of moderate size and comparatively small travel. It looked farther: it desired to make complete connections between the lines running to the east and those running west, in order to give a possible mobilization of the army the assurance of absolute success.

Of this Berlin Elevated Railway we give the following complete account, translated and condensed from that in the Zeitschrift für Bauwesen Herausgegeben im Ministerium der Offentlichen Arbeiten, published in Berlin by Ernst & Korn, and have reproduced, and in some instances redrawn, a number of the illustrations therein contained.

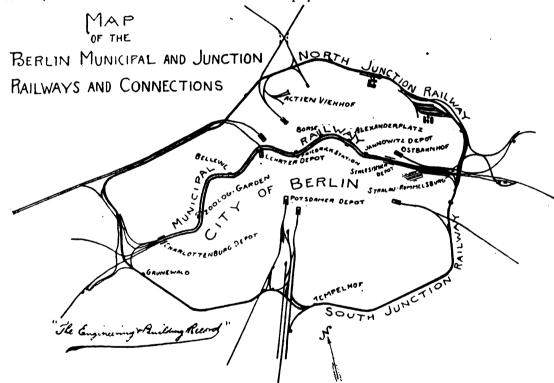

CONSTRUCTION, VIADUCT, TERMINI.

It is a sinuous line, which crosses the city from east to west, following practically the major axis of the ellipse formed by the belt-line, built some years before, which surrounds the town, connecting with all railroads which it intersects. It is separated only a short distance from the Spree River, which it crosses three times. Its length between the two termini (Schlesischer and Charlottenberg) is 12,145 metres. The radii of the curves vary from 300 to 500 metres. The grades are from 2 to 8 in 1,000.

Of the entire structure, 12,145 metres long, 7,964 metres, inclusive of depots and stopping places and stone bridges, was built as arched viaducts; 1,823 metres, inclusive of street crossings and iron bridges, was built with iron superstructure; 675 metres, inclusive of the Silesian junction depot, was built as embankments contained between retaining-walls, and 1,683 metres, inclusive of the depot Charlottenburg, was ordinary embankment.

On account of the low elevation of the tracks of only six metres above the street, no construction could be considered excepting masonry, and where exceptionally iron construction was employed local reasons were the governing causes.

The viaducts are of uniform construction, throughout excepting that the distances between the piers slightly vary. The form of the arch is always a segment of a circle. On account of the great cost of the viaduct careful preliminary work preceded the final adoption of the plans, and the piers and arches were carefully and scientifically proportioned.

The Metropolitan Road was opened February 7, 1882. Thanks to this new line, the trains can cross the capital without being broken up or traversing the line the second time, as easily as they would pass through the smallest station in the empire.

The railroad is an elevated structure crossing all streets and roads above their level. Outside of the city limits. beyond the junction depots, its tracks slope down and connect with the general railway system. Within the city limits the style of the structure was prescribed by the city authorities and it was built as an arched viaduct; the approaches at each end were embankments. At the east end, where the property was more valuable, the embankment was contained between retaining walls; at the west end it was not. It may be remarked here that the prescribed style of an arched viaduct almost invariably coincided with the interests of the railway company, as a comparative estimate of the cost of the viaduct, within the city limits, compared favorably with an embankment on account of the small amount of property to be acquired, and as between an embankment contained between retaining-walls, it compared favorably on account of the possibility of utilizing the arches of the viaduct for business purposes. The road is a 4-track road throughout. The two northern tracks are reserved for local traffic, while the two on the south are traversed by passenger trains from the trunk and suburban lines; the two services being absolutely distinct.

The engineers did not confine themselves, however, in their preliminary work to masonry construction only, but competitive plans in iron for spans of 10, 12, 15, and 21 metres were also worked out and their cost carefully estimated. These plans included: (1) Iron superstructure on wrought-iron piers; (2) iron superstructure on stone piers; (3) iron superstructure on cast-iron pipe piers. The cost of the iron structure, however, in all cases exceeded that of the masonry viaduct. For instance, for spans of 15 metres and a total height of construction from foundation to rails of 10 metres and for a width of viaduct of 141/2 metres, the cost of Plan No. 1 per lineal metre was estimated at 2,316 marks, of Plan No. 2 at 2.451 marks, and of Plan No. 3 at 2,627 marks, while the masonry viaduct of even greater dimensions only cost 1,987 marks.

The width of the viaduct as finally adopted is $15\frac{1}{2}$ metres from face to face. This width accommodates four tracks, but as it appears now it is insufficient, and does not leave room enough between tracks for employees and workmen to operate and repair the road.

Street-crossings.—The number of street and road crossings between the terminal depots is 65, and, with the exception of a few of the small lanes, which could be carried through the arched openings of the viaduct, they were constructed as iron bridges on massive masonry abutments. Many objections were raised against such an extensive use of wrought iron on account of the diffi-

Digitized by GOOGLE

culty of producing a good architectural effect, and on account of its lack of durability, the greater cost of maintenance, and the increased noise; the lack of head-room, however, compelled its adoption. The plans were worked out with the view of producing the best possible appearance. It was insisted that the crossing should be absolutely water-tight, and that noise was to be avoided as much as possible. The style and the number of girders of the different crossings varies very much according to locality and available head-room, crossings having 4, 6, and 8 girders each respectively. The determination of the number of girders depended upon the head-room, the amount of material required, and on purely local reasons. Where there was plenty of headroom, six girders generally carried the four tracks. The six girders were divided into two systems of three girders each, braced together and carrying each two tracks. Where head room was scant eight girders, as a rule, were used, and in two cases four girders only were used. Where it was possible arch bridges were used, but

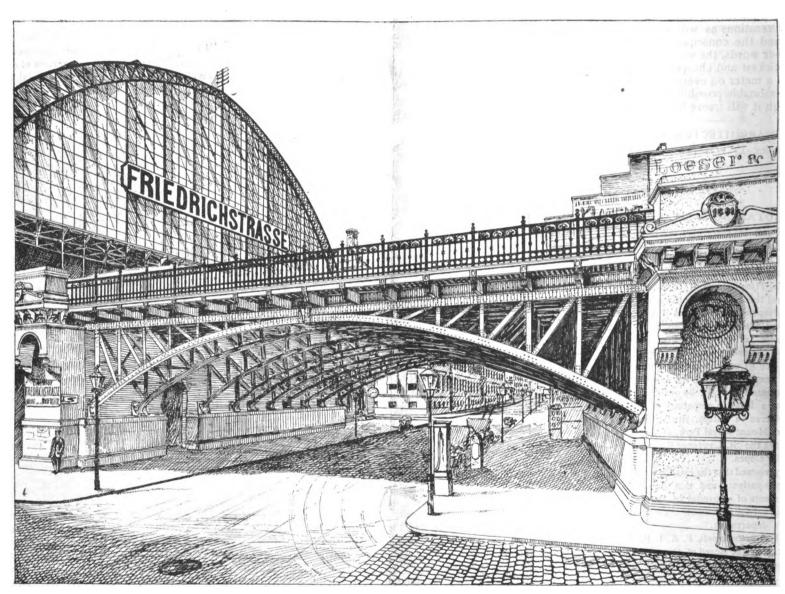

When latticed girders were used they had parallel chords and single triangular web systems, with riveted joints. Much attention was paid to the road-bed; the principal requirement was that of being absolutely watertight, and the second condition was noiselessness. Many experiments and observations were carried on for the purpose of ascertaining the causes of the noise and the mode of preventing it, and, as the result, it was found that the noise caused by trains moving over iron bridges increased in direct proportion with the length of the bridge, but there was no material difference between latticed or plate girders, and the theory that the plate webs were transmitters of the noise was not proven. Bridges which had the rails resting on wooden longitudinal sills made less noise than those where the rails rested directly on the iron superstructure. It mattered little whether the intervening wood was arranged as longitudinal sills or as transverse ties. Layers of felt or rubber between sills and cross-ties reduced the noise slightly both in wood and iron construction. The covering of iron

The buckle-plates rest upon a grating made of angleirons, and the convex side of the buckle-plates is turned downward. All buckle-plates were galvanized, the covering of zinc amounting to .55 kilos per square metre. The best zinc only, without admixture of lead, was used. In order to avoid the sliding of the gravel filling upon the buckle-plates, they were tarred and covered with sand. The roughness of the surface thus produced was sufficient to hold the gravel without interfering with drainage.

For the purpose of drainage the lowest courses of the buckle-plates were perforated with holes, connecting with a system of wrought-iron leaders. The latter connected through the piers with the sewers. All street-crossings were provided with sidewalks and hand-railings.

Painting.—All iron was first cleaned and oiled, then covered with two coats of red lead and oil in the shops, and after erection painted with two coats of paint, consisting of fifty parts by weight of white lead, fifty parts of zinc, and one part of ultramarine.

Besides the two terminal depots at Schlesischer

beam bridges predominated; both arch bridges and beam bridges were of the plate-girder type. Of the 60 bridge crossings, 52 were beam bridges and 8 arch bridges; 40 of the crossings have continuous plate-girders, resting on four supports. In beam bridges the length of span varied from 7½ to 15½ metres, with the ratio of depth to length from one-eighth to one-eleventh.

The intermediate column supports of the continuous girders were arranged as pendulum posts, with ball and socket joints under the girder and at the bases of the columns. They are mostly of cast iron; in some cases wrought-iron columns have been used and ornamented to as high a degree as the material will permit. Each column carries from 100 to 155 tons of weight. Their bearing surface on the foundation piers varies from 0.700 to 0.810 metres diameter; the columns weigh on an average 1.550 pounds and cost 269 marks.

The continuous girders resting on four supports had to be anchored at the abutments so as to transmit a negative reaction; all bearing plates are of simple form and of cast iron.

structure with a plank floor had no noticeable effect upon the decrease of the noise. A covering of the tracks with a thin layer of gravel reduced the noise very materially, but the most effective thing was a regular gravel road-bed. The quality and condition of the rolling stock had the greatest and most remarkable influence upon the quantity of noise. In accordance with the above observations, two styles of road-bed were worked out. First, longitudinal sills bedded in gravel, rested in sill-carriers. The sillcarriers were trough-shaped, and the space between the sill carriers was covered with thin buckle-plates to make the deck water-tight, and covered with a thin layer of gravel to reduce the noise. In the second plan the whole deck is formed of buckle-plates and ballasted, with the rails and rail carriers bedded in gravel. The first mode was intended to be used on straight stretches between depots and turnouts. Both plans fulfill the condition of being noiseless, but the second plan is superior to the first in respect to water-tightness. The buckle-plates could be made so light that the saving of material was quite considerable and that style of floor was generally adopted.

and Charlottenberg, the Metropolitan has eight stations. Three of them are so constructed that they are used for both the trunk line and local traffic; they are, in going from east to west, Alexander Place, Frederick Street, and the Zoological Gardens.

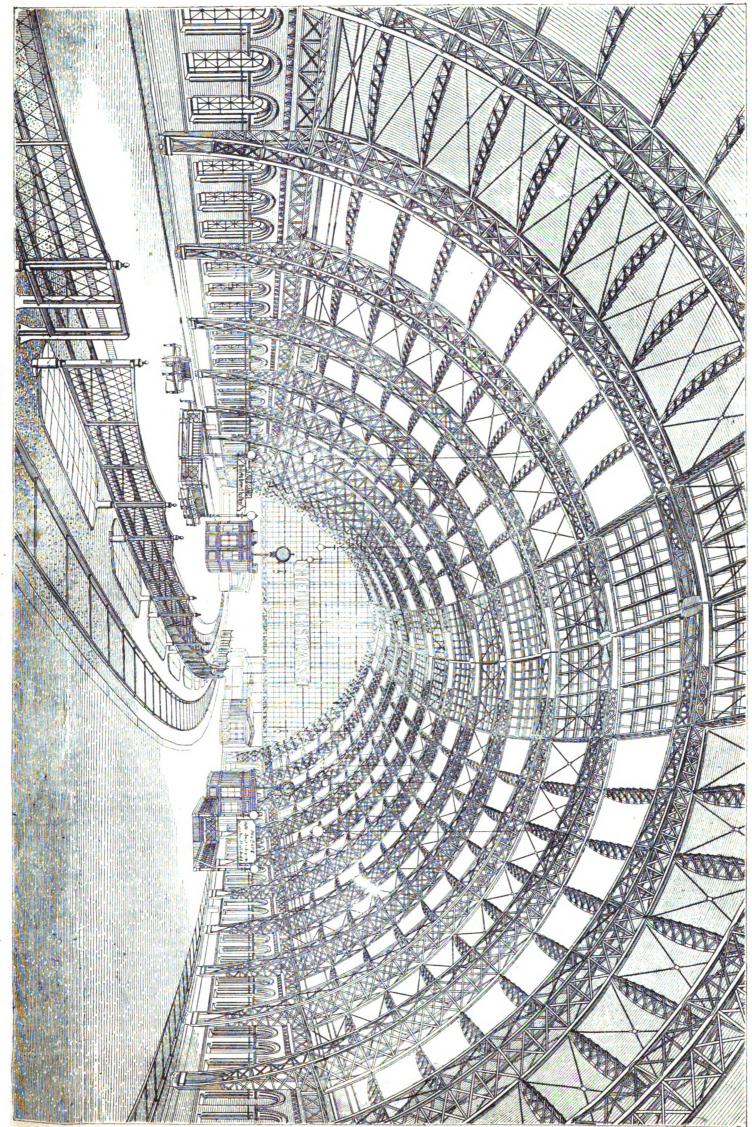

The distance between stations varies between 1.69 and 2.26 kilometres. The speed of trains between stations must not exceed 45 kilometres per hour.

All of the depots and stations are remarkably well designed. They are built of two stories. The lower story, on the street level, contains the ticket-taker's gate, the waiting rooms, the buffet, etc. Large staircases give access to the upper platform, which is on a level with the road and covered.

Baggage is only received at the stations used by the trunk lines. The baggage-rooms are also upon the ground floor, the baggage being raised to the platforms by hydraulic elevators.

The construction of the termini is of brick masonry. These bricks are partly dull and of different colors, and partly enameled upon their exposed faces, giving the archi-

Digitized by

INTERIOR OF FRIEDERICHSTRASSE DEPOT.

Digitized by GOOgle

tecture a rather pleasing appearance, while it is, at the same time, somewhat pecular. Stone (granite and brown freestone) has only been employed very quietly, and for the sole purpose of decoration.

The metallic imitation of wood work which is used varies in design for each station. It is usually remarkable for its lightness. Lighting is accomplished from three points; vertically from above and laterally from two sides where windows are placed. The rest of the carpenter's work is covered with corrugated iron.

The immense vaulted hall at the Frederick Street station is worth mentioning; it is 230 feet wide and 492 feet long. Those at Alexander Place and at the Schlesischer station are equally remarkable.

There are as yet only a limited number of streets running alongside the viaduct; but this matter has been provided for, and they are being increased from year to year. In course of time the road will run through a wide avenue built up on either side. The vaults of the viaduct are rented at a price that compares well with the rental of the finest locations in Berlin. They are especially desirable for wine-cellars and restaurants, which are fitted up with the greatest luxury.

MOVEMENT OF PASSENGERS AND FREIGHT.

The city of Berlin, which is in the full vigor of its growth, and whose population is every day increasing, contained at the last census, 1,230,000 inhabitants.

It is difficult to determine the number of passengers which are carried over the Metropolitan Railway in the trains of the trunk lines. Their numbers can only be found in the general statistics of the different lines.

For the local traffic the average circulation is from 25,000 to 30,000 passengers per day, about 10,000,000 per year.

The price of third-class tickets from one station to another is 2.4 cents, and for a through ticket 9.6 cents. In second class the corresponding charges are 2.4 cents more. Commutation tickets are sold to workmen at a reduced price, but they are only good from seven o'clock in the morning to six o'clock in the evening in winter, and from six o'clock in the morning to seven o'clock in the evening in summer.

Freight trains are not run over the tracks of the Metropolitan Railway, but are sent over the Belt line.

A sense of admiration will be felt when the Berlin Metropolitan Railway is carefully studied.

We may criticise on many of the features and dispute the art stic value of the several parts, but it is none the less true that the whole is exceedingly remarkable, as well for the conception of the work, as for the great care taken in the execution of the smallest details. Furthermore, aside from its strategic importance, the Metropolitan has become in a few years indispensable to the Berlinese population. It has enriched certain parts of the city, here-tofore poor and neglected, and, thanks to it, entire quarters have been built upon portions that were formerly worthless. In subsequent issues we propose to give further descriptions of the structure and numerous illustrations of interesting features and details.

(To be continued.)

PAVEMENTS AND STREET RAILROADS. No. XXVII.

(Continued from page 116.)

ASPHALT AND OTHER PAVEMENTS IN THE CITY OF LONDON.

CONTINUING our account of experience in England, we come next to a series of reports on the pavements in the "city of London" proper, where the travel is probably more per unit of width than in any other city in the world. We are indebted for the information to William Haywood, Esq., Engineer and Surveyor to the Commissioners of Sewers of the city, and the reports date from 1886 back to 1853. The first wood pavement seems to have been laid there in 1839. One laid in 1842 up to 1853 had had two renewals, making the average total cost (including 4½d. per annum for repairs) to be 1s. 11d. per year. Granite for the same time cost 9¾d. total per year. To the cost above for wood should be added about 1½d. for sanding to prevent slipperiness. The duration of granite in this statement is taken at 25 years.

The practice is to lay the new granite in the streets carrying the heaviest traffic, then after a certain amount of wear to remove it, redress it as required, and lay in second-class streets, and, finally, after a second removal, it is

placed in streets with least traffic on them. The dressings are used in macadam, and finally the worn-out stones take the same course.

Statistics are given of a granite pavement on London bridge where it lasted 12 years under this enormous traffic before renewal. The stones, originally 9 inches deep and 6 wide, had worn down an average of 2 inches. The cost per year was 4½/d. for maintenance and 1s. 10¾/d. for laying, or 2s, 3d. per year.

In the Poultney, another very busy street, the wear in six years was 1 1/2 inches.

From a table given we learn that the first squared granite blocks were laid down in 1828 and were not renewed for from 16 to 25 years. These were 6 inches square by 9 inches deep. The 3 and 4 inch granite cubes were introduced in 1844, and bore the very heavy traffic of Cheapside and similar streets for 7 to 9 years before relaying, many of the blocks being still fit for use.

Up to 1852, of 21 wood pavements, the time down before renewal ran from 23 months up to 8½ years, the larger number lasting less than 4 years.

There are about 51 miles of public ways in the "city," containing 441.250 square yards of carriageway and over 300,000 square yards footway.

The next report in the series dates 1870, and contains an account of a pavement called "McDonnell's patent Adamantean," composed of broken stone not over 3 inches diameter imbedded in asphalt, and laid in blocks 18x12 inches and 6 inches deep, with **X-inch joints filled with asphalt.

An interesting case is reported where suit was brought by the owner of a building against the commissioners for damages caused by raising the grade of the street so that he had to use steps to go down to his property. The case was decided on final appeal in favor of the commissioners, on the ground that it was done in the interest of public traffic.

The report states that since 1867 the commission has removed all dust, ashes, and trade refuse.

The street "orderly" system and erection of iron bins along the sidewalks for the reception of the manure collected was begun at that time and has been continued to the present.

The average amount of material removed per week, not including snow, was 972 ½ loads.

The usual requirements as to maintenance are as follows: In the case of asphalt pavements the contractors for the pavement when new agree to maintain it in good repair for two years without cost to the city, and after this for fifteen years more at a price per square yard per annum named at the time of bidding and based on the total area paved. The pavement to be in good condition (to the satisfaction of the engineer) at the end of seventeen years, and to weigh at that time not less than a given amount per square vard.

For wood pavements the agreement is entirely similar except the provision as to weight.

The report of 1871 mentions the first laying of granite blocks with wide joints, and filling with small pebbles, and a composition of pitch and creosote oil poured hot.

Observations made that year show that there were fewer falls of horses from slipping on pavements of compressed asphalt than on the ordinary granite pavement.

Experiments were made that year on melting snow from the streets by steam and gas.

On account of disturbance of the streets for laying pipes of various kinds subways are pointed out as the only remedy. They were then in use in four streets.

It is interesting to notice in all the reports thus far frequent mention of street widenings, which have done so much towards relieving the street traffic during recent years.

In 1872 mention is made of the failure of a pavement consisting of blocks of compressed asphalt laid on concrete and grouted with bitumen. These were 12x6½ inches and 2½ inches deep. Much consideration was given to asphalt pavements this year.

The first specimen of the regular Nicholson wood pavement was laid also, and as asphalt was considered unsuitable for grades steeper than one in sixty, wood is suggested as a possible substitute in such localities, taking the place of the asphalt.

Complaint is still made of the disturbance of the streets for laying of pipes.

In 1873 the Adamantean pavement laid three years before is reported upon. It showed serious wear at the

end of one year, at the end of eighteen months received extensive repairs, and in two years was so bad that further payments upon it were withheld,

A pavement of Trinidad bitumen, broken stone, chalk etc., laid hot, was proven to be a failure; also, one consisting of a mixture of certain oils, caustic lime, pitch, sawdust, etc.

A pavement of compressed asphalt from Seyscel rock (Societé Française des Asphalte), also from Montrotier asphalt, proved enduring.

Experiments also showed that such pavements would not aid in spreading fire.

Patent wood pavements of various kinds began to be experimented with.

A footway of Portland cement laid under pressure was also put down.

Seven street-sweeping machines are reported in use.

The washing down of streets paved with asphalt begun in 1866, and was still under trial as an experiment.

It would seem from a statement made here that the city retains full control of the subways under the streets.

• More streets were torn up for pipes of the Gas Company and Hydraulic Pressure Company.

Conflicts of authority are noted between the Commission and Metropolitan Board of Works as to control of certain streets, etc.

(To be continued.)

THE NICARAGUA CANAL SURVEY.

PRESS dispatches up to January 4 indicate that the surveying parties are well established in their various camps, with a comfortable headquarters at Camp Carazo, on San Francisco Island, some forty miles up the San Juan River, and probably by this time the survey is well under way; in fact, parties had been then at work some three weeks.

The boundary question between Nicaragua and Costa Rica is still unsettled, but as both countries are friendly to the enterprise it would not appear likely to make much difference to the canal whichever way it is decided, except that, of course, it would be more satisfactory to have but one country to deal with in the event of any complications.

The surveyors are hardly enjoying what might be called a "picnic." Since the parties have been at work the rain has poured down nearly every day. The fall of water has been very heavy. On December 29, in 24 hours, 6½ inches and on the day following 4 inches of rain fell. This heavy fall has caused quite a rise in the streams, which is favorable, however, to the transportation of stores to the surveying parties.

The difficulties encountered by the engineers in running their lines are very great. Much of the work is in swampy ground, which the engineers often have to go through up to their waists in water, and where the undergrowth is so thick that every foot of the way has to be cut, and it is impossible to see ahead for a distance of over ten feet. They often have to be absent from permanent camp for several days and sleep on a bed of leaves, on which they spread their rubber blankets, and only rarely when time permits can they even make a shelter of leaves. The insects are a great annoyance. Not only mosquitoes swarm about, but a countless variety of bugs of every size, color, and shape, their sting causing an itching which is almost unbearable. When absent from camp for several days engineers and men, unable to sleep under their mosquito netting, have their faces, hands, and often their bodies covered with welts, and not unfrequently the irritation causes sores.

To offset this, however, there has been very little sickness, which is confined almost exclusively to the laborers. Two of the officers have had slight fever, lasting in each case but a day or two. It seems odd that in both these instances one was a native Nicaraguan, and the other had lived a number of years in South America, while not one of those who are making their first visit to the tropics has been unwell.

In painful contrast to this the Liberian laborers imported by the Panama Canal Company, selected as exceptionally healthy and accustomed to a hot, moist climate, are reported to be dying at an annual rate of 539 per

THE first number of the London Engineer for this year gives a very careful and comprehensive survey of all important engineering works and projects throughout the world, from which in this and one or two subsequent issues we shall take several brief items and abstracts.

REPORT ON BRIDGES INTERFERING WITH NAVIGATION.

THE Secretary of War has transmitted to Congress a letter from the Chief Engineer, together with reports of the officers of the Engineer Corps in charge of various river and harbor districts, concerning bridges, causeways, and structures of any kind now erected or in process of erection that do or will interfere with free and safe navigation, in accordance with the provisions of the River and Harbor Act of August 5, 1886, of which we abstract the principal data in the accompanying table.

Besides the above, mention is made of a number of other bridges causing immaterial obstructions or that may do so under future changed conditions.

Lieutenant Colonel W. E. Merrill refers to a number of bridges over the Ohio and Allegheny Rivers previously reported on, and indefinitely to others over the Muskingum, some of which are obstructions, but recommends in all cases no action until specific requirements have been provided by Congress.

Various instances are noted of obstructing dikes, piles, foundations, and required dredging, snagging, etc., but all the definite statements of existing bridges are given below.

THE NEW STEEL CAST GUN.

The steel casting for the new 6-inch gun was lifted out of its mold five days after pouring, and, as far as surface examination could show, seemed to be an entire success. The gun will be bored—a four weeks' job—at Pittsburg, where it was cast, and then sent to Washington to be rifled. It marks a radically new departure in the manufacture of steel ordnance, and its final test at Annapolis will be watched with much interest.

ANNUAL REPORT OF THE TAUNTON WATER-WORKS.

THE twelfth annual report of the Water Commissioners of the city of Taunton, Mass., for the year ending November 30, 1887, written, presumably, by William R. Billings, Superintendent of the Works, has been carefully prepared and contains several matters of interest.

Taunton had a population in 1885 of 23,674, of which about 21,400 could be supplied by present pipes, and about 19,000 were so supplied. The total number of gallons supplied during the year was 264,618,762, of which over 11,000,000 gallons were metered as follows: 32,446,357 gallons to domestic consumers and 68,672,071 gallons to manufacturers. The average daily supply was 724,982 gallons, being 31 gallons to each inhabitant, or 38 gallons to each consumer, and about 252 gallons to each of 2,875 tape in actual use, and it may be added here that of that number there are but four unpaid and overdue bills. Water is supplied at a pressure of about fifty pounds through 55 miles of cast-iron mains from 4 to 20 inches in diameter, with 347 stop-gates and 24 blow-offs and 470 hydrants. Repairs and maintenance averaged \$50 per mile. There are 28 miles of cement-lined wrought-iron servicepipe, from 1/4 to 11/2 inches in diameter.

There are 776 meters in use, of which 718 are for domestic consumers and 58 for manufacturers, 96 having been added during the year, and this increase in the number of meters has been accompanied by an unusual increase in the receipts from water rates, more than half of which has been from domestic meters. The consumption of water is somewhat less than in 1886, which is attributed to increased rainfall during the summer of 1887, diminishing the amount of lawn sprinkling and general hose use.

We should be inclined to think that the increased use of

meters might have had something to do with it, though nothing is said on that point.

The water-works were built in 1876 by the city, and have cost to date a little over \$500,000. The supply is from ground-water, with the Taunton River for emergencies, distributed by direct pumping against an average dynamic head of 151 feet. The number of gallons pumped per pound of coal is 343, and the duty per 100 pounds of fuel is 43,316,668 foot pounds. The actual pumping expenses were \$5,281.07, being \$19.95 per million gallons against average head, or 13.1 cents per foot of head. The total cost of water delivered, figured on total cost of maintenance, was \$40,186.86, or \$151.87 per million gallons.

Some experiments were made with driven wells, but without satisfactory results, as sufficient water was not found at economical depths.

It appears from the report that the Massachusetts State Board of Health have recently arranged to make monthly analyses of samples of water that may be sent them, and Mr. Billings says: "Already the practical value of this thorough and systematic examination of all public watersupplies in the State is recognized."

OUR PACIFIC COAST LINE.

THE Pacific Ocean boundary of the United States has a greater extent of coast line than the Atlantic shore. The aggregate of our shore line on the Pacific is 12,734 miles, while on the Atlantic it is 11,860 miles, and on the Gulf of Mexico 6,843. It was the annexation of Alaska that promoted the Pacific coast to a higher figure than the Atlantic, Alaska having 9,830 miles of coast line. If the lake boundary is added it gives us a total coast line not very far short of twice the circumference of the earth.

PLUMBING IN THE RESIDENCE OF MAX NATHAN, ESQ.

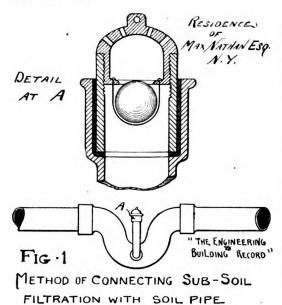

THE following is a description of the details of the plumbing and drainage system in the residence of Mr. Max Nathan, 22 East Seventy-second Street.

The building is four stories, with extension the same height; cellar under the entire structure. The steam-heating plant is provided in the cellar, heat being admitted through registers under the windows in the different rooms. The floor of the entire cellar is laid with concrete.

DRAINAGE SYSTEM.

The soil-pipes are extra heavy cast iron, and the main is six inches in diameter from the sewer through hall to extension, where it is reduced to five inches and carried to rear of extension, there crossing to opposite side, thence returning to wall of main building, where it terminates. The object of extending this pipe on two sides of the cellar in extension is to facilitate connections with the leaders and surface drains of the yard located parallel with it.

About seventeen feet from rear wall of main building a 5-inch soil-pipe branches from the main and is carried up a recess in this wall to the roof. All waste-pipes in the bath-rooms are connected with this soil-pipe. Another 5-inch soil-pipe branches from main in the extension and also carried to roof.

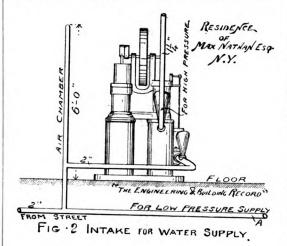

A vent-pipe, three inches in diameter, branches from soil-pipe in extension and is carried to roof, terminating near the 5-inch soil-pipe. The main horizontal soil-pipe can be examined easily at any time by means of handholes, which are provided every fifteen feet in the entire length of the pipe located inside the cellar; therefore, if any obstructions occur they can be quickly removed. A section of these handholes is given on page 105 of Volume XVII of THE ENGINEERING AND BUILDING RECORD. The trap on main soil-pipe is inclosed in a basin which is located in a vault under front steps about twelve feet below sidewalk, and on account of this depth will be liable to become filled with water from the subsoil; but to remove any water that may enter, the device shown in Fig. 1 has been adopted. This device consists of a pipe, two inches in diameter, joined to a hub on the side of trap at the lowest part of bend, thence extending vertically up to flowline of soil-pipe. The top of this 2-inch branch terminates in a brass cap, which is convex and perforated with holes, through which all surface water in this basin above flowline of soil-pipe will enter and be removed.

A circular brass sleeve is leaded into hub of the vertical 2-inch pipe, and a cap secured to this sleeve by means of a screw-joint. This device is sealed against any back flow from soil-pipe by means of the rubber ball shown under cap, which will rise and close the orifice whenever the pressure in soil-pipe is too great. The wire inclosing this ball extends two inches below orifice in cap. The arrangement of ball and opening is shown in Fig. 1.

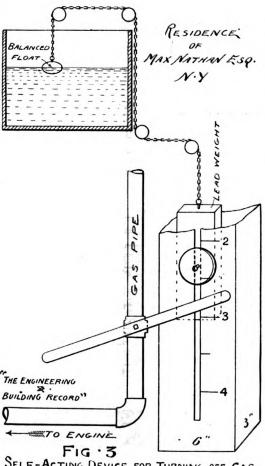

WATER-SUPPLY.

The material used for all pipes in the water-supply system is galvanized iron, except wherever the pipes are exposed in the bath-rooms, then nickel-plated brass pipes are used; but all galvanized-iron pipes where exposed through the building above the cellar are covered with silver bronze.

The main pipe from street to intake, shown in Fig. 2, is two inches in diameter. The water-supply system consists of a street and tank supply, or low and high pressure. Figure 2 represents the intake which supplies water for low-pressure system, with a hot-air engine utilized for pumping water up to a tank located on roof of extension. The top of this tank is 80 feet above the cellar floor. The illustration shows a vertical pipe two inches in diameter that is connected at lower end with main, thence extending to ceiling of cellar, forming an air-chamber six feet or less in height. A pipe of the same size branches from it

and joins lower part of engine, and on this horizontal pipe is set a conical air-chamber. A vertical pipe 1½ inches in diameter, also provided with a conical air-chamber, is carried up through the elevator shaft to tanks shown at N in Fig. 4, through which the high-pressure supply is forced into the tank. The intake, therefore, is provided with

SELF-ACTING DEVICE FOR TURNING OFF GAS FROM ENGINE WHEN TANK IS FILLED.

three air-chambers to modify the pulsations of the pump. The tank is located on the roof of extension, inclosed with brick walls, but is accessible from roof of main building. The tank is made of boiler-iron, the dimensions being 8 feet by 5 feet 6 inches and 4 feet in height, contain-

ing 1,200 gallons. The overflow-pipe from this tank is 3 inches in diameter, extending to roof of main building, where it discharges, as the top of tank extends above roof. No tell-tale pipe is provided for the tank for reasons that will now be explained.

An automatic device for controlling tank supply is illustrated in Fig. 3. It consists of a long vertical box of wood, about six feet in height, secured to a partition inclosing the intake. Within this box a lead weight 8x3x2 inches is held suspended by means of a brass wire chain, which extends up over pulleys, as shown, to tank, where a float is secured to opposite end resting on the water in this tank. The lead weight and float are sufficient to overcome all friction produced by the chain in passing over the large number of pulleys required between the cellar and tank. A wheel about one inch in diameter is secured to counterbalance weight and bearing on the lever attached to gascock, thereby imparting a more uniform motion to the lever as the weight descends. This lever is secured to a stopcock set in the gas-pipe near the counterbalance. It is provided with a vertical slot instead of a round opening, and, therefore, will require only a slight depression of the lever to turn off the gas-supply to engine. The numbers on the face of indicator extend down from top, consequently the wheel will indicate the depth of water in tank at all times,

The operation of this device is as follows: The gasburner is lighted, which soon sets the pump in motion, filling the tank. The float in tank rises with the water and causes a corresponding depression to the weight in indicator, and when tank is filled the wheel by depressing the lever turns off the gas, stopping the action of pump. This lever must be raised by hand before the gas can be lighted; there is, therefore, no danger of the gas being turned on accidentally. After the gas has been lighted no attention is required until the indicator shows that the tank requires refilling.

A sink is located near the intake which receives the discharge from safe wastes. A sink is also located in the extension for butler's use.

A large grease-trap is set under the kitchen, and in the centre of this trap waste-pipes from the butler's pantry and kitchen sinks discharge, flowing thence through into the soil-pipe.

(To be continued.)

THE COMPARATIVE MERITS OF THE ONE AND TWO PIPE SYSTEMS OF STEAMHEATING.

BROOKLYN, December 29, 1887.

SIR: I notice in your issue of the 24th inst. an inquiry from a correspondent in reference to the one-pipe system of steam-heating and your reply thereto, and would like to say a word in reference to the matter. You say, first, that the system is often at a disadvantage in buildings that cover a good deal of ground, when contrasted with the two-pipe system. This is not the case with the one-pipe system, as that term is now used—that is to say, where but one pipe is used for feed and for return for vertical pipes and radiator connections, and separate systems of horizontal feed and return pipes are used. The writer has seen a number of dwellings and similar buildings in which there was not a return or relief pipe of any description, the water of condensation being all returned through the steam-mains, and of course discharged into the top of the boiler. These were all old jobs, and the boilers had to be set very low in order to get the required inclination for the pipes. In regard to a radiator with but one pipe making more noise when steam is turned on than if it had two pipes, I must say that it is news to me, though I have seen steam turned on to a good many radiators with both styles of piping. That it takes longer to free the radiator from water with one pipe than with two I admit, but your remarks in regard to the results caused by a leaky valve, or one not properly closed, will apply equally well to both styles of piping, with this decided advantage, however, on the side of the one-pipe system, that there are only half as many valves to get out of order or be carelessly operated; for with the two-pipe system, as with the other, everything wants to be shut tight or else be wide open, though it is hard to make some people (and not a few either) believe that they haven't done their whole duty when they have shut the feed-valve and left the return-valve to take care of itself. Finally, I claim that in low-pressure heating, where the one-pipe system is admissible at all, it has some decided advantages which do

[There is very much less objection to a one-pipe system that has separate steam and return mains than there is to a one-pipe system with no separate return main. It is, in fact, a two pipe system as far as the mains are concerned. The principal objection, however, to a radiator with a single pipe and valve for both the steam and the condensed water is, that when the radiator is full or partly full of condensed water there is a conflict between the steam to enter and the condensed water to run out. When steam is let into an empty radiator, as the specific heat of the iron is not great, and as it takes some time to expel the air, the influx of the steam as well as the condensation is comparatively slow, and thus the condensed water is enabled to run out along the bottom of the steam-pipe in a contrary direction to the flow of steam without difficulty. provided the pipe is large enough. If, however the radiator has been condensed full of water by being imperfectly closed the steam cannot flow in until the water flows out.

During this struggle for right of way portions of the steam are suddenly condensed and the vacuum thus formed sucks violently back the escaping water with the effect of causing that sharp, uncushioned blow called a water-hammer, so well understood by the experienced engineer and so disagreeably familiar to all users of defective steam-heating arrangements.

This water-hammer will occur also in the two-pipe system under like circumstances, but as in that case the steam is driving the water out before it there is no struggle for right of way, and as the steam and water are less mingled the water-hammer is not likely to be so severe and is certain to last for a much shorter time.

This is the principal objection to the one-pipe system and exists no matter how large the steam-pipe or how well and carefully run, no matter what the pressure used, which is usually low—about one pound.

A two-pipe system, however, can be so arranged that it will will not make a "water-hammer," no matter how badly it is managed by the user, if it is run at very low-pressure, and only one valve will be required to operate each radiator. When the return-pipe of each radiator of a very low-pressure system is carried separately below the water-line, the return-valve can be omitted on the radiator, or, if put on, it can be allowed to remain open; then the radiator can be operated with all the ease and convenience of the one pipe system, and as the radiator can never get full of water, the noisy disturbance above described cannot occur.

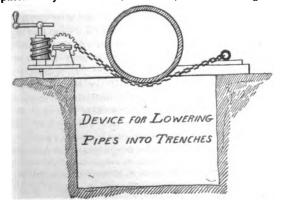

This is plain to any one thoroughly versed in low-pressure heating, but for the information of our less experienced readers we will explain that when steam is shut off from a radiator whose return-pipe runs separately to below the water line unless the pressure carried exceeds one pound for every 28 inches that the radiator is above the water-line, the water will not back up into the radiator, and there will consequently never be any water in it, provided, of course, that the usual automatic air-valves are used, which prevent the formation of a vacuum that might otherwise suck the radiator full of water when the steam was shut off.]

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

DEVICE FOR LOWERING OR RAISING PIPES IN TRENCHES.

THE accompanying sketch shows a novel device just patented by Lewis Boore, of Buffalo, N. Y., and assigned

to Theodore H. Meyer and others, of the same place. It consists of a portable frame adapted to rest over the trench, provided with two separate and independent chains, one end of each being removably attached to one side of the frame and the other end of each being secured to and adapted to be wound upon separate drums, each being adapted to be operated independently by separate gearing and lever-handles.

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

VALVE WANTED TO DRAIN CELLAR AND KEEP BACK-WATER OUT.

SIR: Kindly inform me where I can get a good valve to drain cellars and to keep the back-water out, as I have a customer who wants something of this kind.

Yours respectfully, Louis Waefelaer.
54 Beekman Street, New York.

[There are back-water traps advertised in our advertising columns. We do not know of a valve for the purposes mentioned. May be some of our readers can supply the information.]

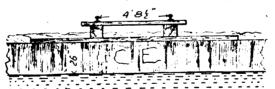

RAILROAD TRAINS CROSSING THE ICE.

A CORRESPONDENT recently wrote us the following:

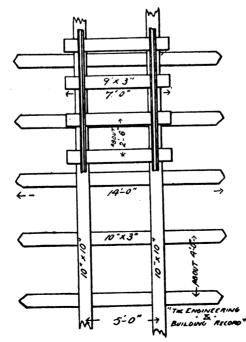

"In previous years I have frequently heard, at about this season, of railroad crossings over the St. Lawrence being effected by simply laying ties and stringers directly on the ice, spiking the rails to the longitudinals and runing the locomotives and trains over this track as on dry land. As the subject is of considerable novelty and interest to myself and probably others, can you publish the details of this matter, the size, dimensions, and arrangement of ties and stringers; if they are in any way fastened down to the ice; if curves are permitted and of what degree; if any ballast is used between ties? What is deemed the minimum safe thickness of ice, if any restrictions of weight, length or speed of trains are imposed, and what are the heaviest engines permitted to cross? For any, or all of this, or other pertinent information on the matter, I should be greatly obliged to your valuable paper. Respectfully yours,

[We referred the above inquiry to Mr. P. A. Peterson, Engineer of the Canadian Pacific Railway, and are indebted to him for the following data and the sketch from which the accompanying illustration has been made.

This sketch shows the railway as it was put down the second and third years. The first year the

ICE BRIDGE RAILWAY -- ST. LAWRENCE RIV.

longitudinals were laid directly on the ice, but afterwards they were laid on cross-timbers about 14 feet long, 3x10 inches, and spaced 3 feet centres. Ordinary 16x24-inch locomotives were run across this track drawing trains of loaded cars. It was found that in some places the ice cracked, and lighter engines were then used. The sketch will show the size, dimension, and arrangement of stringers.

It should be understood that the ice at this part of the river is principally packed ice and not frozen in a solid sheet. It is formed of bordage ice and frazil, which comes from the rapids above and jams at this point and is then frozen together. There are parts of it where there is simply the ordinary ice of the river. The ice was leveled off, cross-timbers laid down, and holes were then cut at the side of the track, from which water was taken and thrown over the snow and level ice, so that the timber, ice, and snow were all frozen together. The ice was found strong enough when the lower cross-timbers were put under the longitudinals to carry a 16x24-inch passenger engine built at that time.

LONDON CORRESPONDENCE.

In presenting the certificates at the conclusion of the winter term to the students of the Crystal Palace School of Engineering, Mr. William Henry Precce, F. R. S., Mem. Counc. Inst. C. E., bore testimony to the advantages possessed by an applicant for engagement in an engineer's office, if he held the certificates of the school. As a member of the Council of the Institute of Civil Engineers, he stated that the possession of the certificates was a passport for any one desiring to enter the institute as a student. In the course of his remarks on the value of such training for young engineers, Mr. Preece referred in eulogistic terms to the Boston Engineering College, pointing out that that establishment was the result of private munificence. He claimed credit for the engineering profession for the position held by England as a nation, on the ground that electricity and steam have placed England in communication with the rest of the world, a fact very frequently forgotten by politicians, who claimed the credit. Referring to the point of admittance to the Institute of Civil Engineers, Mr. Wilson, M. I. M. E., M. I. C. E., the principal of the school, stated that the regulation had just been made, that only those applicants possessing the certificates for the two years' course would in future be able to look for admittance as students on the strength of those credentials. It is a matter of great regret, that the Crystal Palace authorities, who derive a larger proportionate income from the school, than from any other part of the establishment, educational or otherwise, are so shortsighted as to "staive" the workshops with lack of good machinery. The bad machinery with which the students had to work was a matter of comment on the part of one of the examiners.

In Madrid, Spain, the authorities have decreed that all theatres must be lighted by electric lights. It is stated that the authorities have decreed that all theatres not lighted by this medium will, perforce, be closed.

The scheme to bridge the English Channel from Boulogne to Folkstone is arousing very much the same "flutter" in the breasts of a great number of people over here as was the case in the Channel Tunnel scheme. Newspaper articles, written in the most serious spirit, decline to submit the safety of England to the care of a sleepy watchman or sentry. There is evident fear that the bellicose and acquisitive spirit of our French neighbors is such that they would unceasingly watch for the first surreptitious "nap" on the part of the sentry and immediately, in that event, march a large army over. The presence of any engineering skill capable of destroying the bridge (or channel) in the case of war is discounted.

MAJOR MARINDIN, acting as Inspector for the Board of Trade, in his report on a recent railway accident on the North-Eastern Railway, gives point and force to a complaint which has long been made by the railway employees all over the country. He attributes the accident in great measure to the long hours the men have to work. The engine-driver had been at work 31 hours, and the other men even longer. He states that such hours of work should not be tolerated either in justice to the men themselves or in the interest of the public; it being impossible for a driver, however good a man, to work for such a time without getting worn out, and being consequently inattentive and unfit for the performance of such responsibilities.

SPACING TRAVELER FOR MULTIPLE PUNCH.

THE accompanying figure illustrates a device designed and used by the Smith Bridge Co., of Toledo, O. It is made from a pencil sketch, showing the essential features of worm-gear and hand-wheel.

The punch-table was a long bed, carrying at frequent intervals the rollers, R, with track-rails, on which an ordinary four-wheeled truck is mounted. One axle of this truck carries a pinion engaging a rack parallel to the rails. At the centre of the same axle is a wheel geared into the worm of a vertical shaft, which has an upper bearing in circular plate P; a horizontal wheel, W, is keyed to the end of shaft above and just clearing P. One revolution of this wheel propels the truck exactly one inch on its track. The handle of the wheel is bored to admit a plunger rod, A, with button-head. B, which is held up by a spiral spring in the chambered handle. The plate P has eight equidistant holes in a circle just under the centre of handle and bored to fit the plunger. C is any convenient grip.

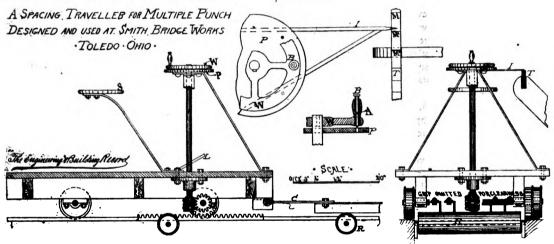

satisfactory results. Early in the spring of 1887 the owners of the Riverside Iron-Works, of Wheeling, W.Va., decided to build and operate a tube-works for the purpose of utilizing, in the manufacture of iron pipe, the product of their rolling mill and forge plant, which had then laid idle for about three years, by reason of the substitution of steel for iron in the manufacture of nails.

During the progress of the construction of the tubeworks the general manager of the company, Mr. Frank J. Hearne, discussed with the writer the possibilities of steel as a material for pipe making, and it was then decided to put the matter to a practical demonstration.

Towards the latter part of August about thirty tons of steel were made and rolled into skelp and delivered at the tube-works as a trial lot, to be made into pipe.

The welders at the furnaces said at the outset that it would not do, that it would not stand fire, and, by reason of their prejudices against steel, they subjected it to abuse by severe overheating; yet every piece of that lot made a sound salable pipe, the welders remarking that "it was the best material to weld they had ever handled." It was threaded and finished with the same success as it was welded.

Soon after this several lots of one hundred tons each were made, and a record kept of the loss in the furnaces, crop ends, leakers, etc., which proved to be so very favorable to the use of steel for pipe-making that the company decided to manufacture steel pipe exclusively, and to abandon the use of their forge and iron-making plant altogether.

In operation a template T is prepared, having the rivet pitch indicated by transverse pencil marks M, and placed in convenient wall-brackets. The end hole is laid off and punched in the required piece or set of pieces, and while the punch remains in the hole, the truck (the worm-gear being disengaged) is run to the end of the piece and grips C rigidly attached. The attendant mounts to seat S, engages worm-gear by foot-lever L and adjusts template T, so that the first mark M' is exactly coincident with point of index I.

The punch is then withdrawn from hole and attendant rapidly turns W until I approaches very near M', whenhe depresses B with his thumb and A engages the first hole met in P, the truck stops, the required hole is punched, B is released, and the operation rapidly repeated.

The pitch is, of course, in eighths of an inch or multiples thereof, and is punched with great exactness. When the sketch was made the machine was punching six holes through as many long $2\frac{1}{2}x2\frac{1}{2}$ L's, guided at die-block by spacing fillers, and was easily and rapidly propelled by one man, while one other worked the punch-lever. These two men were able to handle material from adjacent skids with the differential hoist and performed the work usually requiring at least four men on a spacing punch. Up to a pitch of about three inches a hole can be punched at every revolution of an ordinarily-speeded punch; for greater pitches it is safer to take alternate revolutions.

THE MANUFACTURE OF WELDED STEEL TUBING.*

FOR a number of years past experiments have been made with steel as a material for the manufacture of welded pipe and boiler tubes, but with varying and un-

*Abstract of a Paper read before the Engineers' Society of Western Pennsylvania January 17, 1888, by Thomas J. Bray, Superintendent Tube Department Riverside Iron-Works, Wheeling, W. Va. The steel used is made in a Bessemer converter, the chemical analysis I am unable to give correctly at present, but, regarding its physical properties, can unhesitatingly say that it is the smoothest, toughest, and kindest material to work with and to weld into pipe that has ever been tried or used by the writer.

Samples cut from ordinary Riverside steel pipe show the character of the material in the cold and hot states. A washer was made out of a piece of four-inch steel pipe one and one-half inch long by a blacksmith, by turning one edge of the pipe inwards and flanging out the other edge, then flattening it out into a washer. Two goblets were made out of two inch and four-inch pipe respectively, necked down and welded to form a leg or stem, then flanged out for foot and mouth.

There is considerable loss in iron butt-weld pipe by its splitting in the weld on being tested to the regulation pressure of three hundred pounds per square inch. With steel pipe this loss is reduced to less than one per cent, by reason of the superior welding qualities of this steel over iron.

This steel is made at the Riverside Steel-Works by Mr. E. L. Wiles, M. E.

The paper was discussed as follows in the absence of the writer:

Mr. A. E. Hunt, in showing the samples, stated that while the results were good they were no better than those obtained by many other makers of soft steel; that his experience proved steel could be welded almost as easily as iron, and suggested as his idea of the composition of such steel the following analysis: Carbon, under .15 per cent.; manganese, at least .50 per cent. and up to 1 per cent.; silicon, less than .02 per cent.; sulphur, less than .03 per cent.

Mr. P. Barnes, Superintendent Jones & Loughlin, Limited, stated that he had been advised by the manager of the Riverside Works that their analysis was: Sulphur, about .06 per cent.; manganese, about .25 per cent., with carbon and silicon about as stated by Mr. Hunt, but that he was of the opinion that more was due to the skillful manner in which the steel was handled in the work that to the chemical composition of the metal; that while it had been found that the cutting of the threads in steel pipe was harder on the dies than cutting iron pipe the increased service and consequent economy more than compensated for extra cost of tools.

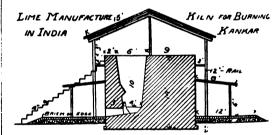

LIME MANUFACTURE IN INDIA.*

THE lime is not obtained by burning ordinary limestone, but by reducing a nodular substance called kankar, which is found in beds near the line of the work. This material may be defined as an argillaceous limestone containing from 30 to 37 per cent. of sand.

The beds generally occur some few feet below the surface of the ground, and are found by probing with iron rods. The kankar is broken to a gauge of 1½ inches and thoroughly cleaned from all dirt and small pieces before being introduced into the kiln. The reason given for breaking it to so small a size is that the nodules may be directly fed to a Sucop's pulverizer without the necessity of further breakage.

Dust coal is used for burning in the kilns, which are generally of the perpetual type. These kilns are built in continuous double or single lines or grouped four together, the single-row plan being preferable, as it allows of easier drawing.

The process of burning is as follows: The kankar is carried from the stacks to the kilns and placed therein in layers alternately with the coal. The kankar layers should be about three inches thick and rather thicker in the centre of the kiln than at the sides. On the top of each layer of kankar is spread a laver of coal (which cannot be too finely ground) about a quarter of an inch thick; the best way is to measure out the correct proportion of coal and spread it as evenly as possible over the kankar. In starting a kiln, the flues at the bottom should be closed with dry bricks and a layer of upla laid first of all. After loading the kiln as above described, one or two bricks are removed and the upla set on fire. When the fire has reached nearly to the top of the kiln, which can be known by probing with an iron rod, all the bricks should be removed, and about one quarter of the contents of the kiln withdrawn from the bottom, the kiln being filled from the top as before; after the kiln is working properly, the burnt kankar should be withdrawn every morning.

It requires considerable care in burning to prevent this burnt material from becoming vitrified when the kiln is recharged. To prevent unequal settlement the kilns were choked by the corbelling shown on the opposite side from the flues, the amount of projection being arrived at by experiment. This was partially successful, but not quite. and the lime burning required more supervision than is usually the case. This unequal settlement also affected the quantity of burnt material turned out. A 15-chamber kiln contains 3,150 cubic feet, and an out-turn of 1,200 cubic feet per diem was calculated on. As an average, l was never able to get more than 1,000 cubic feet per diem. When the kilns were first started the out-turn was about 800 to 850 cubic feet on the average, and after carefully supervising the burning I came to the conclusion that this was also due to the unequal settlement. At the beginning of this season a 30-chamber kiln was built and left unroofed and its out-turn was 2,000 cubic feet, against 800 cubic feet from roofed kilns of half the size. A native burner suggested that the roof of the small kilns was stopping the draught, and as every other reasonable suggestion had been acted on without effect, the roof was removed. In the course of a tew days the out-turn went up to 900 cubic feet, and finally to 1,000 cubic feet, where it has remained

*Summary of a report by Mr. N. F. Mackenzie, Executive Engineer, Nadrai Aqueduct Division, Lower Ganges Canal, published in the Indian Engineer.

ever since. It is therefore not advisable to roof the kilns.

After burning, the material is ground in a Sucops pulverizer to various degrees of fineness, the finest mesh (12) being about the same as that used for passing ordinary English Portland cement.

In order to get some idea of the results of grinding the lime of different degrees of fineness, various sizes of screens were used, and the following table shows the breaking weights per square inch of the different kinds of mortar. These were all treated in the same way. The lime was sent direct from the mill to the mortar-pans in the foundations, there mixed and returned to the experiment room, where it was molded into briquettes and set under damp grass, that being a nearer approach to the conditions under which the mortar sets in the work than the method of setting the briquettes under still water.

Each result is the average of six or eight tests.

Breaking weights in lbs, per square irch fo set under damp erass for various periods.										r lime

The "season 1885-86" lime is a mixture of several different gauges, the kankar, however, being the same as used for the other tests.

Owing to a scarcity of screens, various kinds were employed, and the lime was not kept separate in the godowns. The general result is inferior to that of the other tests, where the various sorts were kept quite separate.

It will be seen from the above table that in the sixth and seventh months the finer the lime the higher the breaking weight, and after those periods the results do not differ very much. I infer from this that the finer the mortar the quicker it sets, although in the ultimate tests when the morter has finally set, the breaking weights do not vary very much with lime, all of which is ground very fine, although, as a general rule, the finer the lime the better the result. This is shown plainly by the difference between the 6-mesh and the 12-mesh tests.

WADDELL'S SPECIFICATIONS FOR IRON AND STEEL HIGHWAY BRIDGES.

In this publication by J. A. L. Waddell, Mem. Am. Soc. C. E., the specifications are accompanied by a review of the highway bridge practice in the United States. The introduction is a forcible presentation of the urgent necessity for reform in the methods of securing highway bridges. Some disasters are noted that were due to incompetency, dishonesty, and criminal carelessness of contractors, and some precautionary measures are outlined.

The author describes the crooked practices and skin games of bridge fakirs and dishonest contractors (even county commissioners sometimes) at bridge lettings, and mentions some of the infinite variety of devices for evading specifications and scamping work. He notes some of the commonest heresies and mistakes in designs, and presents some excellent principles and hints for the intelligent designer. An association is proposed to be formed of bridge engineers, builders, and contractors for mutual profit, improvement of work, protection, and restraint, to be bound under penalty of heavy fines to do first-class work. These purposes are laudable, but their fulfillment as proposed is certainly impracticable.

Mr. Waddell presents minute and comprehensive specifications for design, in the main correct and desirable and as applicable as general specifications can be. "The manufacturers' standard specifications" which have been adopted for metal, are incomplete and in some points objectionable, especially for steel, being much behind the times in the present rapid development of its manufacture and uses.

The specifications for shop work embrace many good points, but cannot cover the wide field. They form a good text, however, for general guidance, and should be supplemented by special instruction to inspectors.

The subject of piers and abutments of masonry, or other material supporting iron and steel superstructures, has been omitted.

The education of the public that the author advises must be limited to the possible and useful. We believe that to secure a general realization of the importance of the subject and its present dangerous and wasteful treatment, and to direct careful, intelligent consideration to local structures, is the most that can be attained.

The "every man his own engineer" principle is mischievous and dangerous, and contractors cannot be absolutely relied on for voluntary disinterested conscientiousness much this side of the millennium.

Buildings are (rather should be) engineering structures, and as such should invaribly be designed and approved by experts, and their construction subjected to constant rigid inspection. These requirements should be legally provided for and enforced by State legislation, and we are glad that an effort is being made in Pennsylvania, and proposed in several other States, to secure the necessary laws.

Mr. Waddell's pamphlet should reach township authorities. His recital of the tricks of the unscrupulous contractors and committeemen will have a good educational effect. The specifications might be published separately, as they are necessarily too technical to be of much use to laymen.

ILLINOIS SOCIETY OF ENGINEERS AND SUR-VEYORS.

THE third annual meeting of the Illinois Society of Engineers and Surveyors was held in Springfield, O., on the 25th, 26th, and 27th of January.

Morning, afternoon, and evening sessions were held and the attendance throughout was large. The reports of the several officers and committees were submitted and acted upon, and numerous interesting papers were read by different members of the society.

Senator Cullom's bill establishing a Bureau of Public Works was approved.

On Thursday, January 26, the society went on special train on Wabash Railway, by invitation of Charles Hansel, Chief Engineer, to the rolling mills and other points of interest.

A feature of the meeting was the exhibition of drawings, which was large, varied, and interesting. Thirty new members were elected, and the following officers were chosen for the year 1588:

President, C. G. Elliott, Gilman, Ill.; Vice-President, D. W. Mead, Rockford, Ill.; Executive Secretary, Professor A. N. Talbot, Champaign, Ill.; Recording Secretary, S. A. Bullard, Springfield, Ill.; Treasurer, A. N. Talbot, Champaign, Ill.; Executive Board, A. H. Bell, A. N. Talbot, E. A. Hill, G. P. Ela, C. G. Elliott.

The next meeting will be held in Bloomington, Ill.

At the annual meeting of the Master Builders' Exchange of Philadelphia, on January 24, in the Exchange Rooms, Third and Walnut Streets, the following directors were elected for the ensuing three years: Stacy Reeves, George Watson, William II. Albertson, Fred F. Myhlertz, William C. McPherson, George W. Roydhouse, and J. S. Thorn; and William Gray was elected for unexpired term of two years. It was reported that the Exchange was in a very flourishing condition; over \$97,000 has been received during the year, portion of which was realized through the sale of bonds to purchase the Exchange's new building at a cost of \$75,000. In the evening a banquet was given at St. George's Hall by the Exchange, celebrating the first anniversary of their organization, at which over 350 persons were present.

AMERICAN SOCIETY OF CIVIL ENGINEERS.
A MEETING of the society was held on February 1, 1888.
Vice-President J. James R. Croes occupied the chair.
A paper by S. H. Chittenden, M. Am. Soc. C. E., on
"Description of the Work of Constructing a Dam Across
the Potomac River for Increasing the Water-Supply of
Washington, D. C., was read and discussed by Messrs.
Croes, Hutton, Flagg and others.

The deaths of the following members were announced: Charles H. Fisher, of Lansingburg, N. Y.; Fred Mercur, of Wilkesbarre, Pa.; Frank Beresford, of Cincinnati, O.

The following standing committees were announced: On Finance, Stevenson Towle, Charles B. Brush, Mendes Cohen; On Library, J. James R. Croes, Alphonse Fteley, Joseph M. Wilson.

Professor Eadweard Muybridge, well known for his studies of the motions of men and animals by instantaneous photography was among the visitors, and after the formal exercises were concluded showed to the members a very interesting series of illustrations of his peculiar work.

The following gentlemen were elected:

As Members—Daniel Seymour Brinsmade, Envineer Ousatonic Water Co., Superintendent Shelton Water Co., and Agent Birmingham Water Power Co., Birmingham, Conn.; Lorenzo Russell Clapp, now Assistant Engineer Department City Works, Brooklyn, N. Y.; Frank Paul Davis, Assistant Engineer District of Columbia, and now on leave to act as Assistant Engineer District of Columbia, and now on leave to act as Assistant Engineer on surveys for Nicaragua Ship Canal, Washington, D. C.; Clarence Delafield, Hydraulic Engineer for S. R. Bullock, New York City; William Franklin Denois, Assistant Engineer Richmond and Danville R.R., Washington, D. C.; Edward Flad; Emil Gerber, Resident Fngineer Sioux City Bridge Co., Sioux City, Iowa; George Blagden Hazlehurst, Assistant Engineer B. & O. R. R., Baitimore, Md.; Allen Bogardus Hegeman, Contractor's Engineer Kansas City Extension, Chicago, Milwaulee and 5t. Paul R. R., Ottumwa, Iowa; Alexander Joseph Swift, Chief Engineer Northern R. R. Department Delaware and Hudson Canal Co., Albany, N. Y.; Elliott H. Wilson, engaged in general civil and mining engineering, member of firm Wilson & Gillie, Butte City, Mont.

As Juniors - Kayajiro Kobayashi, with J. A. L. Waddell, M. Am. Soc. C. E., Kansas City, Mo.; George E. Moulthrop, Assistant Engineor Montana Central R. R., Butte City, Mont.; Robert Ridgway, Assistant Engineer New Croton Aqueduct, in charge of Croton Gate House and Shafts o and I, Sing Sing, N. Y.

ENGINEERS' CLUB OF PHILADELPHIA.

THE regular meeting of the club was held January 21, 1888, President Joseph M. Wilson in the chair; twenty-four members and one visitor present.

The Secretary presented, for Mr. C. H. Ott, an accoun of a peculiar case of transmission of vibrations and pulsations through structures. Annoying, and even serious, vibrations, in this case, were found, by direct experiment, to be occasioned in a building at one end of a solid row 400 feet long, by the operation of a small engine running a spice grinder in a retail grocery store at the other end of the row.

A general discussion of vibrations in structures followed, participated in by a large number of members, and numerous instances were noted. Mr. John T. Boyd described vibrations, in a large office building, that had never been satisfactorily accounted for; Mr. Henry G. Morris, in a large hotel, created by the elevator pumps; Mr. Howard Murphy, the relative effects of the carthquake on different floors of an office building; Mr. F. W. Whiting, where the fourth story of a five-story mill building, in Philadelphia, vibrates $\frac{1}{2}$ 6 of an inch, and a mill building, in Massachusetts, where the vibration is so great as to cause nausea among new employees, and where the water cannot be kept in a fire bucket, yet the building is probably at least ten years old and seems to stand it.

Mr. Joseph M. Wilson referred to the evil effects of continuous vibrations in structures, and noted, incidentally, a case in his recent practice where large marble blocks had been broken by the freezing of water in the lewis holes; Mr. Howard Murphy referred to the vibration in the large Scotch stacks, and Mr. Henry G. Morris noted the case of a stack 125 feet high, where the vibration was 1½, inches. Messrs. Seaman, Haupt, Cleemann, Brown and Redway took part in the discussion.

Prof. L. M. Haupt submitted a few extracts from the Report of the Chief of Engineers with reference to the theoretical operation of submerged jetties, and made some comments thereon to show why the system had apparently not proven more successful.

Mr. A. Marichal presented a mathematical discussion of the theory of curved dams for the reference book.

Mr. F. W. Whiting noted a case in hydraulics, where attempt had been made to bring water in a pipe across an embankment, which had been unsuccessful until an opening was made at a point in the pipe 1 ne, and a small pipe extended therefrom to the level of the source.

Mr. Howerd Murphy suggested that the trouble had probably been caused because the hydraulic gradient had not been considered in the original location of the main pipe.

ENGINEERS' CLUB OF ST. LOUIS.

THE club met January 18, 1888, President Holman in the chair; W. H. Bryan, Secretary; eighteen members and four visitors present. Malverd A. Howe was elected a member.

A communication from the Civil Engineers' Association of Kansas on the interchange of papers and proceedings was read.

Professor Johnson called attention to a pamphlet by J. A. L. Waddell on improvements in the construction of highway bridges. J. B. Johnson, Robert Moore, and N. Digitized by

W. Eayrs were appointed a committee to consider same with a view to endorsing the author's ideas.

Mr. N. W. Eayrs then read a paper on "The Improvement of Nantucket Harbor, Mass." The sandy coast rendered the work slow and difficult, as only the scouring effect of the tide was available. Great difficulties had been met with, but good results were already apparent. At the beginning a mean channel depth of only six feet was available. This had already been increased eighteen inches, and the plans contemplated an ultimate mean depth of twelve feet, and possibly fifteen. It was discussed by Messrs. Ockerson and Wheeler.

The secretary read a paper by Professor C. C. Brown, of Union College, Schenectady, N. Y., on "State Surveys." The author showed the great necessity for more careful and detailed surveys, their probable cost, and the best methods of undertaking same.

Professor Nipher exhibited another cast-iron cap burst by firing a rifle-ball into a cylinder of water, the bottom of which was closed by the cap.

Mr. Crow exhibited an improved form of radial draw-bar adapted for cable-car service.

PROPOSED NEW PHYSICAL UNITS.

M DE FREYCINET recently presented an interesting paper to the French Academie des Sciences, which is published in the *Chronique Industrielle* of November 27. Its object is to show that a modification of certain mechanical units will secure sensible advantages and a much more rational conception of physical properties.

Many authors establish a kind of logical relation between force, weight, and mass, but in order to clearly separate the ideas, it seems necessary to commence by defining the forces and masses and the velocities which the former communicates to the latter without considering the force of gravity and its effect on the bodies.

Imagine a body rolling without appreciable friction on a horizontal plane. If we represent by 1 the effort necessary to communicate a given velocity to a cubic decimetre of ice, the efforts required to communicate the same velocity to a cubic decimetre of iron, mercury, aluminium, etc, will be respectively 7, 14, 2½, etc.

The above determination of mass by applied force will always exactly coincide with values obtained by observing the action of gravity in a vacuum.

Mass is therefore very easily determined by weighing a body, since mass, gravity, and weight are, under the same conditions, all proportioned to one another.

The unit of length is the distance passed over in one second by a body moving uniformly at the velocity acquired in falling freely for one second of mean time in vacuo at Paris, equal to about 9.8 m. The unit of volume is a cube whose side is $\frac{1}{100}$ the unit of length, equ. 1 a out 0.94 litres. The unit of mass is the mass of water (at temperature of 4° C.) contained in a unit of volume. The unit of weight is the unit of force, and is the weight, at Paris, of the unit of mass. All other units are derived from these.

Let us call that property of a body by which it absorbs more or less dynamic force in acquiring a certain velocity in a given time its dynamic capacity; then two masses are dynamically equivalent when the same force imparts the same velocity in the same time to each mass. The dynamic capacity of iron being seven times that of water a cubic decimetre of iron is dynamically equal to seven cubic decimetres of water, and may, therefore, be considered to contain seven times as much matter, and the density of iron is seven times that of water. Mass and density are thus defined independently of the force of gravity, and their values can be determined by submitting a body to the action of a known force; this quantity and the observed acquired velocity will determine the required values. The dynamic unit results from the choice of a unit of length, or vice-versa. The characteristics of this system are (1) that the unit of length is founded on dynamic phenomena instead of being chosen arbitrarily and a priori from terrestrial lengths; (2) that the unit of mass is the unit of weight instead of being a multiple of that unit.

DISPOSAL OF SEWAGE AT SEA.

A STEAMSHIP costing nearly \$16.000 has been constructed to carry 1,000 tons at each voyage of the solid residuum of the London sewage out to the North Sea from the Barking Creek Sewage-Works. Four or five more such ships will be required to deal with the entire quantity.

NEW ENGLAND WATER-WORKS ASSOCIATION

THERE will be an adjourned meeting of this association at Young's Hotel, Boston, on Wednesday, February 15, 1888. The rooms will be open for members use at 11 o'clock. The association will not be called together until after lunch, which will be served promptly at 1 o'clock. The following is the topic for discussion: "Water Waste—with especial reference to the amount used during the winter months to prevent freezing."

Members are requested to present their individual experience relative to the increased demand during a series of cold days; the steps which they would have taken to check this abuse, and any other facts pertaining to the subject which may have occurred in their individual experience. Members are requested to notify the Secretary, R. C. P. Coggeshall, New Bedford, whether or no they will attend

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.

An invitation has been extended to the society to hold the spring meeting of 1888 (XVIIth) in the city of Nashville, Tenn., which has been accepted. It will probably occur in the end of April or beginning of May. The manuscripts for the meeting should be sent in before March 17, 1888. As many of the papers as possible should be in print before that date, particularly if illustrated. Council meetings to examine applications for membership occur at the end of February and of March.

THE PROPOSED MUNICIPAL BUILDINGS IN THE NEW YORK CITY HALL PARK.

I ITTLE has been heard of that mistaken scheme to erect a couple of buildings adjoining the City IIall and the County Court-House since Assemblyman Crosby introduced his bill at Albany to prevent such a spoliation of the park. Yet the scheme is not dead; it only sleeps. Its advocates are apparently lying low in the hope that the Legislature will forget the Crosby bill and adjourn without passing it. The time within which architects' designs will be received by the Commissioners of the Sinking Fund on lines already laid down and circulated has been extended until April, and there is little doubt unless the Crosby bill is promptly passed that the city will be committed to their scheme. The bill should therefore be enacted without delay.—N. Y. Tribune.

OPENING OF THE MERCED IRRIGATION CANAL.

THE great Merced Irrigation Canal was formally opened Lebruary I. The canal was begun five years ago by Charles Crocker and C. H. Huffman. It cost \$1,500,000. It is twenty-seven miles long, 100 feet wide at the top, seventy at the bottom, and ten feet deep. It will irrigate 300,000 acres of the most fertile land in California. The great engineering features of the work are two tunnels, one 4.400 feet long, driven through the hill of solid rock, no supports being necessary; the other 3,000 feet long, faced with timbers. The dam across the small valley near Merced, constructed to form a reservoir, is 4,000 feet long, 275 feet wide, and 54 feet high.

PURCHASES OF STEEL RAILS FOR 1888.

Press dispatches from Pittsburg report that the railroad companies and the steam manufacturers have finally come to an agreement whereby the Pennsylvania Railroad have placed orders for 50,000 tons at \$31.50 per ton, to be divided between Cambria Iron Company, the Pennsylvania Steel Company, and the Carnegies.

The Chicago, Burlington, and Quincy Railroad has placed an order with Chicago mills for 20,000 tons at a somewhat higher figure. This would seem to indicate a resumption of business in these very important industries, and the prospect of further railroad building in 1888, all of which will benefit directly or indirectly many of our readers.

NATURAL GAS FOR TOLEDO.

THERE is before the Ohio Legislature a bill authorizing the city of Toledo to issue bonds to the extent of \$750,000, to be used in putting into operation and maintaining a system for additional supply of natural gas to the city. Mayor Hamilton, of Toledo, has addressed a remonstrance to the Committee on Municipal Affairs giving strong reasons against its passage.

PROFESSOR ASA GRAY.

PROFESSOR ASA GRAY, of Harvard University, died at his home, in Cambridge, Mass., January 30, aged seventy eight years.

The deceased was born in Paris, Oneida County, N. Y., and received the degree of M. D. at the College of Physicians and Surgeons for the Western District at Fairfield in 1831.

Professor Gray was a constant, earnest worker in original fields, where his contributions have been of great value. He was for more than fifty years a regular contributor and for twenty years editor of the American Journal of Science and Art.

He received in 1835 or 1836 the appointment of botanist to the Wilkes' South Sea Exploring Expedition, but resigned it and accepted the Chair of Botany in the University of Michigan, and soon after spent a year in scientific European research.

In 1842 he was appointed to the Professorship of Natural History at Harvard University and occupied that position until his death, although relieved during the last tew years of the duties of active teaching.

Professor Gray's writings embrace a long list of educational books and many scientific papers and essays. He devoted his life to the examination of North American flora and published a treatise on its relation to Japanese flora, which he indicates had a common Northern origin in the Tertiary Period.

In his death science loses one of its ablest workers and the world a noble spirit.

CHICAGO'S CITY ENGINEER.

(Special Correspondence.)

CHICAGO, February 1.—The office of Chief Engineer of this city no longer exists, Mr. Artingstall's resignation having been accepted by Commissioner of Public Works George B. Swift, who will at the same time, it is understood, reappoint him presently upon the staff as engineer to design and build bridges and viaducts. The appointment of Mr. F. W. Gerecke, of Newburg, N. Y., as engineer to look after the water-works engines, has also been made.

AN AUTOMATIC GAS-LIGHTER.

A. M WUSTER, of Ybbs, Austria, has invented a device by which street-lamps are automatically lighted and extinguished by the increase and decrease of pressure in the street-mains.

THE GANGES BRIDGE AT BENARES.

THE double-track railroad bridge over the Ganges at Benares, described in *Indian Engineering*, which was completed last October, was commenced in January, 1832, and consists of sixteen spans of a total length of 3,523 feet. Seven are of 356 feet each and nine of 114 feet from centre to centre of piers, some of whose foundations are 140 feet below low water, and contain 16,000 tons of material, all of which was carried to the work on coolies heads along a narrow floating staging. The spans are of steel lattice girders, 25 feet apart to centres, and the main ones are 35 feet deep. Altogether they weighed 6,405 tons. Two temporary piers were built in each of the main spans, and on them the short girders were temporarily placed to form a platform on which to erect the large ones.

Work was carried on day and night by electric lights' as it would have been otherwise impossible to get through such work as must have been completed to render the structure safe from flood during each season.

PERSONAL.

THE copartnership of Wilson Brothers & Co., of Philadelphia, civil engineers and architects, has expired. The old business will be settled by John A. Wilson and Joseph M. Wilson, and a new copartnership has been formed under the old firm name for the transaction of a general business as civil and hydraulic engineers and architects, by John A. Wilson, Joseph M. Wilson, Henry W. Wilson, Charles G. Darrach, and Henry A. Macomb, at 435 Chestnut Street, Philadelphia.

M JOR WILLIAM LUDLOW, recently relieved from duty as Engineer Commissioner, District of Columbia, has received the following letter from the President:

EXECUTIVE MANSION, WASHINGTON, Jan. 26, 1888.

To Col. Wil nam Ludlow, Commissioner, &c.

DEAR SIR: I have directed that Major Charles W. Raymond, of the Engineer Corps, be detailed as one of the Commissioners of the District of Columbia in your place, and he will, I suppose, at once relieve you as such Commissioner. The considerations which led me to make this change of detail do not involve the least lack of confidence in your ability or integrity, and I am glad to certify to your efficiency in the performance of your duty.

Yours very truly, GROVER CLEVELAND.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITIONS.

LINCOLN, NEB.—Plans are wanted here, until February 21, for a county court house to cost about \$170,000. Address O. C. Bell, County Clerk.

SUMMERVILLE, MASS .- Plans are wanted here for a Masonic temple. Address the secretary of the lodge.

NEW YORK CITY .-- The Commissioners of the Sinking Fund have issued a notice to the effect that time for receiving plans, etc., for public buildings to be erected in the city hall park is extended from March I to April 2.

MILWAUKEE, Wis .- Plans are wanted here for a \$40,000 club-house for the Calumet Club. No date specified. Address Bunde & Up-meyer, 123 Wisconsin Street.

TRADE CATALOGUES.

THE Gurney Hot Water Heater Co., of THE Gurney Hot Water Heater Co., of 237 Franklin Street, Boston, Mass., have just issued a forty-page pamphlet entitled "Hot Water Heating," which they have copyrighted. The pamphlet explains the principles of hot water heating, gives hints to fitters, and is descriptive of the Gurney Hot Water Heater, for heating dwellings, offices, while heating consequently also public buildings, conservatories, etc. It also contains a number of testimonials from people who have used their apparatus, and will be sent gratuitously to those interested.

For works for which proposals are requested see also the "Proposal Column," pages i-v-vii-viii-159.

Persons who make any use of the information they find in these columns we trust will not omit to mention The Engineering & Building Record as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and rel able news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not eisewhere published, will be liberally paid for.

WATER, SEWERAGE, ETC.

AMAICA, L. I .- The following communication, dated January 27, has been received from William E. Everitt, Town Clerk of this

place:
'The application of Floran Grosjean and others to supply the town of Jamaica with water was granted at a meeting of the Town Board and Highway Commissioners of said town, held this day, with the exception of within the incorporate limits of the village of Jamaica, over which they have no control, and which is now supplied by the Jamaica Water Supply Co."

FORT SMITH, ARK .- The Sewer Commissioners have issued a notice as follows: Finding that specified weights per foot and thickness of pipe will bar out the Akron, O., and other good brands of pipe, bids will be received on pipe a shade lighter and thinner if of equal strength and quality. J. P. Bates is the en-

NEW REDFORD, MASS. - Mayor Rotch has recommended the introduction of water-meters throughout this place to prevent the extreme waste of water which, he claims, at present prevails. He can give details.

FORT BENTON, MONT. - Several schemes for establishing a water-works system here are on foot, and it is probable that conclusive steps will be taken before long. It is proposed to expend about \$45,000 on the system. The City Clerk can give details.

SAN BERNARDINO, CAL .- Reports from here state that the trustees have accepted plans for a \$130,000 sewerage system.

OTTAWA, KAN.—It is reported that S. B. Christie, of Omaha, Neb., has plans for a sewerage system for this city.

WINNEPEG, MAN .- It is reported that the sewerage system of this city will be extended in the spring.

FRANKLIN, MASS .- Address the City Clerk for details of water-works construction here.

STORM LAKE, IOWA.-According to reports the water-works at this place are to be extended.

HAVANA, ILL.-The question of establishing water-works is being discussed by the tax-payers of this place.

SAUK RAPIDS, MICH.—Water-works will probably be established here.

Howell, Mich.-Water-works may be erected here.

HANOVER, MASS.—The Town Clerk of this place writes us, in answer to an inquiry concerning the reported water works project here, as follows: "I have heard a rumor that they talk of extending the water works to South Hanover from Rockland. No steps taken as yet.'

TAMPA, FLA.-Concerning the reported sewerage project here our correspondent writes as follows: "The establishment of sewerage system is contemplated here in Tampa, but as yet no steps have been taken."

SALT LAKE CITY, UTAH .- Concerning the sewerage question here our correspondent writes as follows: "The sewerage question course there has been no definite plan advanced yet."

NESS CITY, KAN.—R. Osborn, City Clerk of this place, writes us under date of January 17 as follows: "Voted for water works bonds yesterday. Amount, \$25,500."

WEST BAY CITY, MICH.—Concerning the sewer question here our correspondent writes sewer question here our correspondent writes as follows: "The issue of \$60,000 worth of bonds has been ordered. Sewer map to be submitted February 1, and as soon as location of sewer districts are decided upon proposals for labor and material will probably be received."

RIVERTON, NEB.—Concerning water-works matters here, our correspondent writes as follows under date of January 27: "The village of Riverton have on hand the hydrants, pipe, etc., for water-works Bonds of \$36,000 voted, but not sold. Will be issued in a few days."

MILFORD, N. H .- Concerning the waterworks project here our correspondent writes as follows: "The Milford Water-Works Co. organized January 25, 1888, with a capital of \$40,000; C. S. Averill, President; W. Ellis, Secretary—expect to put in works the present year; probably will pump from the Souhegan River."

ATLANTA, GA.—The City Council has appropriated \$55,000 for additional sewer con-

HILTON, N. C.—An artesian well is to be sunk here by the Clarendon Water-Works Company.

Avon. N. Y .- Orange Sacket, the Town Clerk of this place, writes us, under date of January 26, as follows: "On the 6th day of January last our village voted to establish waterworks at a cost not to exceed \$50,000. The Board of Water Commissioners has engaged Mr. E. D. Smalley, of Canastota, N. Y., to make the survey and maps, and to have general superintendence of the work. He will commence on Monday next. Proposals will be ready about the 1st of March."

ST. Louis, Mo.-Concerning the project to erect a set of new buildings here in connection with the water-works, M. L. Holman, Water Commissioner, writes us as follows: "Site for pumping-station purchased—forty acres. Negotiations in progress for about 200 acres for settling basins and route for conduit. Ordinance passed for employment of engineering force. Surveys for construction and plans expected to begin about March 1.'

FRANKLIN, MASS.—In reply to an inquiry concerning water-works matters here we get the following reply from the City Engineer: "New stand-pipe, 80x30 feet, of iron, in the spring.'

COLUMBUS. O.-The City Council has adopted a resolution directing the City Engineer, R. R. Marble, to employ an expert engineer to make an examination and report plans for a complete system of sewerage for the city.

[For other news under this heading see

page 159.]

BRIDGES.

RALEIGH, N. C.—Concerning the bridge project here, our correspondent writes: "We have advertised to receive bids on February 6 for the building of two bridges, and also to pay \$20 for the plan and specifications pre-sented which we may see fit to adopt. We are as yet undecided whether they will be of wood or iron. The width of roadway will be 12 feet in clear; no footway. Capacity of bridge, 1,000 pounds to lineal foot; length of bridges, between 200 and 300 feet."

RAILROADS, CANALS, ETC.

MILWAUKEE, WIS .- The surveyors on the Winona & Southwestern Railroad have found a good route from Winona, Minn., to Mason City, Iowa, and on to Council Bluffs and Omaha. The estimated cost is \$9,000,000, and the road will be 700 miles long.

SPRINGFIELD, ILL.—It is proposed to build a railroad from the city of Decatur, in the County of Macon, to Beardstown, in the County of Macon, to Beardstown, in the County of Cass; the capital stock is \$1,215,-000. The incorporators are: Robert B. F. Peirce and John S. Lazarus. of Indianapolis, and others. The principal office is to be maintained at Decatur

STREET WORK AND PAVING.

MONTREAL, CANADA.—A large section of the city will probably be repaved in the spring.

ATLANTA, GA.-The sum of \$75,000 has been appropriated by the City Council for paving and curbing.

GAS AND ELECTRIC-LIGHTING.

RALEIGH, N.C.—A new electric-light com-pany is to be organized in this city with Julius Lewis at its head. The new company will erect a plant at once.

SAUK CENTRE, MINN.—Henry Keller has been granted contract to light the town by electricity at \$1.50 per month per light.

ATHENS, TENN.-The Athens Mining and Manufacturing Co. will, it is reported, erect an electric-light plant here.

WASHINGTON, D. C.—It is reported that the Automatic Portable Gas-Works will erect an extensive plant here.

CHATTANOOGA, TENN. -It is reported that an extensive fuel-gas plant is to be established near this city.

GRACEVILLE, DAK.—Natural-gas has been struck here at 140 feet in an artesian well.

BUFFALO, N. Y .- Concerning the published report that a \$40,000 building was to be erected here for the plant of the Thomson-Houston Electric Light Co., an official of the city writes as follows: "We are at a loss to by what authority such a notice was l. The committee have come to no deciissued. sion as yet; have not even consummated a purchase of a lot, and have not employed any architect, and consequently have nothing new for them.

SHARON, PA.—The citizens of this place have subscribed \$15,000 for the formation of an electric light company here.

MANCHESTER, N. H .- The People's Gas Light Co., of this city, has closed a contract with Head & Dowst for the erection of a brick building at its works, to be used as a generating room. The building will contain a generator with a capacity for half a million cubic feet of gas a day, or double the quantity man-ufactured at present. It will contain a watergas plant.

SOUTH BOSTON, VA.—An electric light plant is to be established here.

BRIDGEPORT, CONN.—The Flectric Light Company will soon run a mercantile wire into East Bridgeport for the purpose of supplying merchants and others with incandescent lights.

TOLEDO, O .- It is reported that the George Sherman Company has decided to build a pipe line from the north-western oil fields to Toledo. The oil will be used mostly for fuel. It is proposed to construct a 4 inch line, which will give a capacity of about 6,000 barrels a day. This line, 30 miles in length, will cost \$75,-GOO.

RIVERHEAD, L. I.—The officials of this place are considering the electric-light ques-

NORTHPORT, L. I .- The question of or-RURIHPORT, L. 1.—The question of organizing an electric-light company for the purpose of lighting the streets and stores by electricity is being discussed, and the prospects are that the movement will be successful.

FAYETTVILLE, ARK.—The Fayettville Electric Light and Power Co. has been formed with a capital stock of \$30,000. E. B. Harrison is at its head.

HELENA, ARK .- The Helena Electric Light and Power Co. has been organized with James Summers as president. The Van Depoe system will be used.

ISLIP, L. I.—It is proposed to place an electric light plant at a point between this village and Bay Shore powerful enough to supply both places with arc and incandescent lights. Nothing definite has as yet been done.

MARTINSVILLE, VA.—J. E. Stovell can probably give details of an electric light project here.

GREENVILLE, MISS.—It is reported that the Greenville Water Works Company will establish an electric light plant.

BIDS OPENED.

PHILADELPHIA, PA. - Proposals for the supplv of gas-meters for the ensuing year were opened January 26 by Director Wagner. The bidders were:
For meters of three lights: Helme,

For meters of three lights: Helme, Mc-Ilhenny & Co., \$5.40 per meter; Harris, Griffin & Co., \$5.40: American Meter Com-pany, \$5.40: Goodwin Gas-Stove and Meter Company, \$5.40; McDonald & Co., Albany, \$5.45; Dickley, Lansley & Co., Baltimore,

\$5.45.
For five-light meters the first four firms each bid \$5.90 per meter and the other firms

\$6.95.
For the 10-light meters the bids were \$8.80 by Helme & McIlhenny, Harris, Griffin & Co., and the American Company: \$8.85 by the Goodwin Company and the Albany and Balti-

For twenty lights: \$11.75 by the four home For twenty lights: \$11.75 by the tour home firms and \$11.80 by the other two. For thirty lights, \$16.25 and \$16.30 respectively. For lorty-five lights: \$22.75 and \$22 80. For sixty lights: \$32 50 and \$32.75. For 100 lights: \$54 and \$54.60. For 150 lights: \$83.75 and \$84.50

\$84.50.
For 200 lights: Harris, Griffin & Co. and the American Meter Company bid \$117.50. the Albany and Baltimore firms bid \$119.

For 300 lights the bids were \$197.50 by the home firms and \$200 by the other two.

Helme & McIlhenny, Harris, Griffin & Co., American Meter Company, and the Goodwin Gas-Stove and Meter Company, all of this city, were of the six firms who bid December 13 last but whose hids were rejected and seemer. 13 last but whose bids were rejected and new proposals invited because of the similarity in the bids.

The bidders for rebuilding the stables at the Ninth Ward Gas-Works were: Thomas Garrison, \$19,000, to be completed in ninety days; C. McLean, \$15,200, to be finished by April 16; John D. Hart, \$15,531, time, three months; Allen B. Rorke, \$15,673, no time specified; William T. Wilkins, \$15,480, time, four months. The bid of Mr. Garrison was rejected as being too high, and that of Mr. Rorke because no time was given. The de-The bidders for rebuilding the stables at the Rorke because no time was given. The department estimate for the work was \$12,000.

The contract was awarded to Helme & Mc-

I he contract was awarded to Heime & Mc-Ilhenny, Harris, Griffin & Co., the American Meter Co., and the Goodwin Gas-Stove and Meter Co.

TRENTON, N. J .-- Synopsis of bids for lighting the public streets, opened January 27 by the Common Council:

Wheeler Reflector and Light Co. proposed to furnish light (occlusive to the council)

to furnish light (coal oil) at \$19.75 per lamp

per vear.
Pennsylvania Globe Gas Light Co. proposed to furnish light at various figures from \$16.50 to \$23.50 per lamp, according to the kind and quality of the material.

The contract was awarded to the Pennsylvania Company, they to furnish the \$23.50 lamp (naphtha) which has been used by the city during the past two years and which has given general satisfaction.

JERSEY CITY, N. J.—The following proposals for the erecting of a compound pumping-engine at the High-Service Water-Works, to have a daily capacity of 5,000,000 U. S. gallons, have been received by the Board of Works:

Holly Manufacturing Company, of Lockport, N. Y., \$31,300, \$20,000, and \$17,000, for three different classes of high-duty pumps respectively.

respectively.

H. R. Worthington, New York, \$30,500. This includes improvements to the boiler-plant in order to secure the increased steampressure necessary.

The Davidson Steam-Pump Company, New York, offered to erect a compound pump for \$22,400, or an improved triple-expansion engine for \$26,500.

Each of the bidders submitted his own

plans and specifications. Commissioner Van Keuren questioned the legality of their course, Commissioner Van and the Corporation Counsel will be asked to decide the matter. The bids were laid over under the rules.

HILLSBORO, ILL.—The contract for constructing a system of water-works for this place has been let by the City Council to the Beloit Wind-Engine Company, of Beloit, Wis. The works will cost about \$20,000 when completed. Work will begin as soon as the weather will permit.

KANSAS CITY. Mo.—Synopsis of bids for

KANSAS CITY. Mo.—Synopsis of bids for constructing 900-foot viaduct, opened January 28 by John Donnelly, City Engineer:

Keystone Bridge Co., Pittsburg, \$34,900; The Pittsburg Bridge Co., Pittsburg, \$27,575; Atlanta Bridge and Axle Co., Atlanta, Ga., \$26,500: Milwaukee Bridge and Iron Works, Milwaukee, \$26,400; Penn Bridge Co., \$25,-290; P. E. Lane, \$26,666; Kansas City Bridge and Iron Co., Kansas City, \$27,984; Wrought Iron Bridge Co., Canton, O., \$22,500, awarded; King Iron Bridge and Mfg. Co., Cleveland, O., \$25,646; Columbia Bridge Co., \$25,192; A. J. Tullock & Co., Leavenworth, Kan., \$27,900.

The contract for constructing masonry in the piers and abutments in the foundation of the viaduct was awarded to James Murray at \$4,320.20. Other bids were as follows: E. C. Coolidge, \$8,665.91; Andrew Keating, \$5.282.75; M. Walsh, \$6,668; Keefer & Fisher,

282.75: M. Waish, \$0,000; Keeler & Fisher, \$4,,425.40.

The contract for half the viaduct was awarded by the Public Improvements Committee to J. W. Hoover, of the Canton, O., Wrought Iron Bridge Co., who bid \$22,500. The contract was restricted to one-half the work, as the appropriation, \$28,000, is not work, as the appropriation, \$28,000, is not seem to be appropriated to the best of the product of the best of the product of the base of the product of the base of the product of the base of the product of the base of the product of the base of the product of the base of the product of the base of the product of the base of the product of the base of the product of the product of the base of the product of the base of the product of enough to complete the viaduct, which is to be sixty feet in width and to consist of a double roadway and two avenues for foot passengers.
Under this contract but one roadway and one passenger avenue will be built.

NEW YORK CITY.—Synopsis of bids for removing the pier at the foot of West Thirty-eighth Street and for preparing for and building a new wooden pier and approach, and for repairing the existing crib bulkhead thereat, opened January 27 by the Department of Docks. The engineer's estimate was as follows.

Class 1, crib bulkhead: new crib-work complete, about 6.750 cubic feet; yellow pine plank, about 2,133 feet, B. M.; wrought-iron dock spikes, about 166 pounds; excavating, etc., about 225 cubic yards; labor of framing,

etc., about 225 cubic yards; labor of framing, carpentry, etc.

Class 2, new pier and approach: yellow pine timber, about 452,382 feet, B. M.; labor.

Bidders: P. Sanford Ross, class 1, \$1,275; class 2, \$48,700. Richard Cronin, class 1, \$1,120; class 2, \$45,790. John W. Flaherty, class 1, \$1,375; class 2, \$54,700. William P. Kelly, class 1, \$1,375; class 2, \$54,700. William P. Kelly, class 1, \$1,375; class 2, \$53,000. John Gillies, class 1, \$1,075; class 2, \$48,410. John G. Haskings, class 1, \$900; class 2, \$55,000.

BOSTON, MASS.—The only bid received by the Superintendent of Streets on January 28 for building the Boylston Street bridge was from the Boston Bridge-Works, whose proposal was \$47,200. An informal bid was sent by the New Jersey Iron and Steel Company for \$45,500, but it was not considered. The work will be done by the Boston Bridge-Works.

WILLIAMSPORT, PA .- In opening bids for sewers last week the two lowest bidders had not made their proposals in conformity with specifications; therefore, all the bidders will be given another opportunity or a new letting will be declared.

TOO LATE FOR CLASSIFICATION.

OSCEOLA, FLA.-Water-works are projected

CUBA. N. Y .- The citizens of this place are agitating the water-works question, and it is probable a system of water-works to cost about \$50,000 will be built.

TROY, ALA.—Our correspondent writes from here as follows: "A new system of waterworks, capable of supplying 5,000 people and live stock, is contemplated. Mayor Charies Henderson, Troy, Ala., can give full partic-

NEW ROCHELLE, N. Y.—At a recent meeting of the Citizens' Committee to whom had been referred the matter of providing plans for sewering the place, plans were adopted, and it was agreed to send them to the Legislature for the enactment of a bill permitting the village to go ahead with the work at once.

CHATHAM, VA .- Address the Mayor for particulars of water-works project here.

FARMINGTON, CONN. -- There is a reported water-works project here.

PETERBORO, ONT.—It is reported that a system of sewers will be constructed here.

CANTON, O .- The city officials are considering the question of improving the sewerage

UTICA, N. Y.—It is reported that a reservoir is to be built here.

JERSEY CITY, N. J.—The water-supply question was agitated at a meeting of the Board of Public Works held February 1, and a resolution directing the Clerk to advertise for proposals for a supply of pure and whole-some water was passed. Chief Engineer Ruggles had prepared the necessary specifications. The water is to be delivered in the High-Service reservoirs, and the contract, if awarded, is to run for ten years.

The contractor is to be required to keep the

pumps, reservoirs, and mains at Belleville and on the Hackensack meadows in perfect repair. In addition to the usual bonds the successful bidder is to be required to deposit \$500,000 in cash in a bank to be designated by the city as an additional precaution.

ROGERS, ARK.—It is reported that water-works are to be erected here and that Messis. Graham & Mason are interested.

EUSTIS, KAN.—Arrangements are being made to establish a system of water-works

FLUSHING, MICH.—The question of establishing an electric-light plant is being agitated here.

Digitized by GOOGLE

ROCKDALE, TEX .- Water-works are being

FARMVILLE, VA .- The City Council has decided to illuminate the public streets by electricity.

SHARON, PA.—This place has subscribed \$15,000 to the Sharon Electric-Light Com-, which will immediately proceed to supply the town with light.

BURLINGTON, IOWA.—A bill providing for a railroad, foot. and wagon bridge to be built across the Mississippi River at this place has been passed by the Senate.

Deane Steam Pump Co., Holyoke, Mass.—5,000,000 gallon, low duty, \$26,400; 7,500,000, low duty, \$34,000; on other propositions, \$30,000, \$41,000, \$39,000, \$24,000, \$31,700, \$20,000. \$29,000.

NEW YORK .- The Assembly Committee on Ways and Means has given a hearing on the bill appropriating \$50,000 for dredging the Hudson River from Troy to Castleton. The object of the measure was to increase the width of the channel between Troy and Albany to 140 feet, and between Albany and Casileton to 175 feet.

LANCASTER, PA .- The Lamp Committee of City Councils met January 17, and opened bids for lighting the city, beginning June 1, 1838, as follow

United States Electric-Light Company: For 132 electric lights, or more, 2,000-candle power each, for one year, for 35 cents per lamp per night, and for three years at the rate of 34 cents per lamp per night.

The American Electric Light Company:

Lights of 2,000-candle power at the rate of 35

cents per lamp for one or three years.

The Edison Electric Light Company: First, to light the Mayor's and Treasurer's offices. Council Chambers, station-house and markethouses with 24-candle power incandescent lights for \$5 per annum for a period of one or three years; second, to furnish, erect, and maintain on the lamp-posts now lighted by gas, and erect new ones where necessary, 24candle power incandescent lights at the rate of \$20 per light per year for one year, and \$18 each for three years; third, to furnish, erect, and maintain posts at all points in the city, including the territory now lighted with coaloil, gasoline, and other material, and place thereon 24-candle power incandescent lights for \$20 per lamp for one year and \$18 per lamp for three years.

Pennsylvania Globe and Gas-Light Company: To light the street lamps with gasoline of from 16 to 18 candle power for \$24 per lamp per year for one year, and for \$22.50 lamp per year for three years, and furnish all

lamps and posts at their own expense, the same to remain their property.

Lancaster Gas-Light and Fuel Company: To furnish the gas at the Mayor's office, s tion-house, markets, council chambers, and fire engine houses for one year for \$1.75 per 1,000 cubic feet, light the street gas-lamps for \$26 per lamp per year, furnish new lamp-posts and lamps at \$18 each complete, the lamps to be not less than 16-candle power. For a three-year contract will furnish gas for \$1.60 per 1,000 cubic feet, light the streets for \$24 per lamp per year, furnish lamp-posts for \$18
apiece. Providing the lamps in the middle of squares be used, which will add 300 new lamps to those already lighted by gas, and add an annual consumption of 6,000,000 feet to the amount now consumed annually, gas will be furnished for street lamps at \$1.60 per lamp per year. The award was postponed.

PROPOSALS.

(Continued from page viii.)
